Mr. ERNEST RÜNTZ said he had not been able to be present during the whole of Mr. Hamp's paper, but it had been his privilege some ten months before to hear the author's views in a lecture on the same theme. At that time Mr. Rüntz was in the throes of preparing a paper to be delivered before a society of Welsh architects, and he found Mr. Hamp's lecture of great service to him. With regard to the discussion, the speaker said the meeting was considering a subject which should have received earlier and greater attention. The paper dealt with one of the most essential features of life in the present day. Mr. Rüntz then showed how the development of hotels had gone hand in hand with the progress and change of means of locomotion. Mr. Hamp had traced, he said, the course of such development, and the speaker suggested that the beginning of modern hotel enterprise was exemplified by the one at St. Pancras, built by Sir Gilbert Scott. Referring to the point in the paper treating of the economy of service, Mr. Rüntz said the solution of the problem depended upon the site and the nature of the hotel to be erected. There was no doubt that in the Savoy Hotel the architects had to deal with great difficulties. The sites of the Ritz and the Waldorf hotels did not present such problems, and in his opinion there were no better examples of hotel planning. The arrangement of the kitchen was a most important matter, and Mr. Rüntz said that in order to insure success in this department of work he did not complete his plans until the manager of the hotel was appointed and his approval gained. In the New Gaiety Restaurant they had to plan for a service which could deal with public dining-rooms and residential flats in the same

building. They arranged therefore for kitchens in the basement and on the top floor of the block, and the scheme worked admirably. Mr. Rüntz did not think it was possible to fix upon any absolute principle in planning until the class of business to be undertaken by the hotel was made known to the architect, and even then the plan should develop from the suggestions of those who were to govern the whole concern.

The CHAIRMAN in putting the vote of thanks to the meeting, said they had had one of the most interesting evenings of the session, because Mr. Hamp had brought to their notice a subject which was one of the most up-to-date problems in any big city. The paper drew attention to so much detail in hotel planning that it would serve as a textbook for those who were undertaking hotel construction.

TESSERÆ.

Northern and Southern Gothic Sculpture.

IN the hands of the northern builders sculpture often became rather the means of explaining and animating the stories of their stonework than a matter of abstract decorative science. Flowers were painted red, trees green, and faces flesh colour, the result of the whole being often far more entertaining than beautiful. And also, though in the lines of the mouldings and the decorations of shafts or vaults a richer and more abstract method of colouring was adopted (aided by the rapid development of the best principles of colour in early glass painting), the vigorous depths of shadow in the northern sculpture confused the architect's eye, compelling him to use violent colours in the recesses, if these were to be seen as colour at all, and thus injured his perception of more delicate colour harmonies; so that, in innumerable instances, it becomes very disputable whether monuments even of the best times were improved by the colour bestowed upon them, or the contrary. But in the south the flatness and comparatively vague forms of the sculpture, while they appeared to call for colour in order to enhance their interest, presented exactly the conditions which would set it off to the greatest advantage; breadth of surface, displaying even the most delicate tints in the lights, and faintness of shadow joining with the most delicate and pearly greys of colour harmony, while the subject of the design being nearly in all cases reduced to mere intricacy of ornamental line, might be coloured in any way the architect chose, without any loss of rationality. When oak-leaves and roses were carved into fresh relief and perfect bloom, it was necessary to paint the one green and the other red; but in portions of ornamentation where there was nothing which could be definitely construed into either an oak-leaf or a rose, but a mere labyrinth of beautiful lines, becoming here something like a leaf and there something like a flower, the whole tracery of the sculpture might be left white, and grounded with gold or blue, or treated in any other manner best harmonising with the colours around it. And as the necessarily feeble character of the sculpture called for and was ready to display the best arrangements of colour, so the precious marbles in the architect's hands give him at once the best examples and the best means of colour. The best examples—for the tints of all natural stones are as exquisite in quality as endless in change, and the best means—for they are all permanent.

Early Altar Screens.

As soon as ever the Church, delivered from persecution, had leisure to turn her attention to the details and arrangements of her temples, we find the altar immediately separated by a screen from the choir. The first reference to it which we have is in the description given by Eusebius of the church of the Apostles, founded at Constantinople by Constantine the Great. Here it was reticulated, and of brass gilt. The second Iconostasis of which we know is still in existence in the rock-church of Tepekerman in the Crimea. This was built by the Arians about A.D. 340. It is of stone; on each side (for it is returned to the north) it has four piers which support the roof, and the balusters between them are so contrived as very strongly to set forth the cross. The third instance is the magnificent erection described by Eusebius in the church of Tyre, built by Paulinus. This was of wood, so exquisitely sculptured as to be reckoned one of the wonders of Asia. In the same century, St. Gregory Nazianzen already attaches a mystical signification to the altar screen. He calls it "the screen which divides the two worlds, that which is everlasting and that which passeth away, the boundary of gods and men."

And again, everyone is acquainted with the firmness of St. Ambrose in forbidding the Emperor Theodosius to remain within the cancelli during the time of the Holy Mysteries. Thus, in the fourth century we see that the Iconostasis, though certainly not then known under that name, was, under various titles and in various forms, so universal in the East as to be acknowledged as a symbol, and in all probability was just as general in the West. And at the commencement of the fifth century other examples occur in the latter. Thus St. Augustine, in relating the miracle that was wrought on Easter Day at Hippo on a young man afflicted with palsy, says that when it happened he was holding "the cancelli of the Holy Place, where was the Martyrium." The expression shows clearly enough that no screen dividing choir and nave can here be thought of. In like manner St. Paulinus, in describing the church of St. Felix at Nola, mentions the three doors to the cancelli, just as there are at present in the Iconostasis of the greater part of Eastern churches. Italy, then Egypt, Libya, Greece and Asia Minor had, the Iconostasis before the year 420 as the rule, and to all appearance the universal rule, of their churches.

A New Style.

It seems taken for granted by some people that the formation of a uniform style after the model of those that have been is the grand desideratum, and it may be that the method suggested is the only one by which such a result could be obtained. But then it is not necessary that such a style should be established in order that architecture may progress. We look not that our painters should give the same features or attitudes to their figures, the same composition or tone of colouring to their pictures, nor do we ask this monotony of our sculptors; wherefore, then, should it be demanded from architects? The day has passed when the works of a nation should be reckoned in the aggregate, or their growth described as regularly as that of a vegetable. We want neither a new nor a universal style. It were better that we knew nothing about styles; the very name of them is a bane and a hindrance to the architect, however useful to the antiquary. Let us leave it to posterity to classify our productions, and be sure that if we work simply, neither copying nor striving for singularity, we shall not then so belie the feelings of our age and country but that they must impress themselves upon our work, though we perhaps may see it not. We shall at least do that which shall have an appearance of life, and which, rudely it may be yet surely, shall pierce to the sympathies of men. Each architect should shun plagiarism as a stain on his reputation, and then all beauty is common to him, for columnar architecture and delicacy of moulding and precision of symmetry are not the inalienable property of the Greek, though his school and peculiar orders are. Lofty and graceful proportion, vigorous light and shade, fairy tracery and fretted vaulting are not a Gothic patent, though each cathedral, with its own crisp foliage and quaint imagery and curious penetrations and varied details, left to us throughout the length and the breadth of our land as a record of the labour and zeal and love of their builders, is as it were a sign-manual which it is forgery for us to repeat. The well, however, whence they drew is open to us, and we may do more and better than they, since they have shown us how, and we have not all that lesson to learn for ourselves.

Vitruvian "Decorum."

The sixth branch of study dwelt upon by Vitruvius he designates under the head of Decorum, and by that we may consider to have been implied what we should call now, in structure, its prudence and fitness. Decorum measured out the precise amount of ornament to be incorporated in every part of the structure. It maintained the due relation of size between the various parts of a building; it prevented secondaries being drawn into the position of primaries and vice versa; it gave extra stability to the part intended either for defence or special dignity; it gave vigour and simplicity of form to those parts of the structure most exposed to the action of the elements, and due protection to the more delicate accessories of the structure. It insured the spectator's gathering a right impression of the character and purport at once of the building and of its author, on leaving it as well as upon arriving at it. It insured harmony between his first and last view of the building; it made him reach it with joy and leave it with regret. It was, in fact, the application to it of a cultivated and intelligent good sense; the quality of all others which is perhaps most wanting in the majority of our structures of the present day.

NOTES AND COMMENTS.

A CURIOUS problem awaits solution by the French Ministry of Fine Art. In the first place, it relates to an equestrian statue of NAPOLEON I., which at present might evoke associations not entirely favourable to the Government. Then the artist to whom the work is to be credited has to be officially ascertained, which means a roundabout process, although private people could settle the matter in a few minutes. It appears that in Grenoble there was a bronze equestrian statue of NAPOLEON which was set up in 1867, but after the failure of 1870 it was taken down. The Council believed it to be a work by GILBERT, who was known principally as an architectural sculptor. He died in 1891, and does not seem to have troubled himself about any statue in Grenoble. The Council did not care about the pieces into which the work had to be divided, for it was not cast as a whole. They applied to the local department of artillery to remove it, and may have supposed it would supply material for cannon. It was found to be in the way. A couple of years ago the War Minister applied to the Fine Arts Minister to remove the pieces, and after much investigation of the circumstances an order was given to send the work to the asylum for obsolete sculpture, representing kings, ministers and other great men in Paris. In the numerous documents it was entered as a work by GILBERT, and to the official mind it will always appear as such. Another version of the affair has now to be told. M. NIEWERKERQUE, who was in favour in the court of NAPOLEON III. and was appointed superintendent of fine art, was an amateur sculptor. A statue of NAPOLEON I. was required for Grenoble, and he showed his discernment by giving the commission to M. FRÉMIET, who designed the popular equestrian statue of JOAN OF ARC in Paris. A beautiful steed, which was a gift of ABD-EL-KADER, was used as a model, and the uniform of NAPOLEON was exactly copied. M. FRÉMIET now professes to be ignorant of the fate of his work, and does not trouble himself about it. It is doubtful whether he will visit the dépôt where the pieces are entombed. Meanwhile the Administration of Fine Art can take no cognisance of M. FRÉMIET, for all the official documents ignore him. The work is recorded as one by GILBERT, and as municipal, military and art administrators have agreed, who will have the hardihood to suppose they are not correct?

A CORRESPONDENT who lately visited the shores of the Baltic in order to observe the methods employed in the amber industry boasted that he picked up a small portion of the valuable resin, and was able to put it in his pocket. That might not seem much of a feat to most people, but when it is known that the Prussian Government have monopolised the amber industry, and that the police are sharp-sighted, there was some risk in the little transaction. Painters will not object to the arrangement, for probably the amber varnish which is now to be obtained is superior to any produced by a private maker. The official chemists have found that the finest varnish can be produced from waste known as colophony, and it is easily soluble. In the discussion on Dr. LAURIE's paper (see p. 244) something was said about amber varnish, and he admitted that some of the samples which he obtained, although described by that name, probably did not contain any amber. Artists' colourmen will have to be careful about what they sell, otherwise foreign products will be preferred.

THE French Commission of Historic Monuments are supposed to have control over every ancient building in the country which possesses architectural interest. There are, however, exceptions to the majority of laws and regulations, and among the important examples unrecognised by the Commission is the Bishop's Palace at Lisieux. It adjoins the church of St. Pierre, which

was formerly the cathedral. Why it has escaped the Commission's notice is owing to its excellent condition, which enables it to be used as a law court, a library, a prison and public offices. The Department of Calvados is responsible for its upkeep and has faithfully conserved it. As it adjoins the public garden, which is almost unique in beauty, any neglect of the palace would be more marked than in an ordinary case. The building is constructed of brick and stone and was erected in the seventeenth century by Maréchal GOYON DE MONTIGNON. There is a fine staircase with a ramp of wrought-iron which leads to the Salle Dorée, a noble room with a sculptured and painted ceiling. There are a few old paintings on the walls, which are hung with Cordova leather. The Chambre Rouge is used as a council chamber. The condition of the building could not be improved if controlled by the Historic Monuments Commission.

"HADFIELD'S Manganese Steel" is known wherever metals are used. Some years ago Mr. R. A. HADFIELD granted a license to the TAYLOR Iron and Steel Company of the United States for its production. A skilled expert from England was employed for about nine months. The company professed to have subsequently introduced improvements which they regarded as trade secrets. An assistant superintendent having left the TAYLOR Company's service to enter the works of a rival company, an injunction was applied for to prevent his divulging any of the TAYLOR Company's secrets. It was stated that by the agreement signed by him the secrets governing the HADFIELD process were to be considered confidential only until the expiration of the life of the HADFIELD patents. The New Jersey Court of Chancery came to the following conclusion:—"A manufacturer of steel used secret methods in his business which yielded an improved product, and engaged an employé who contracted to serve for five years and who agreed not to divulge any of the secret processes. A competitor induced the employé to break his contract of employment and to enter into a contract of employment with him. The first manufacturer was entitled to an injunction restraining the employé from disclosing the secret processes, and to restrain the competitor from using information acquired from the employé, and from continuing him in his employ." It is to be hoped the decision applies to the original secrets as well as to those of the TAYLOR Company, for otherwise it would be unfair to one of the most important companies in this country.

THE risk of a peaty subsoil has been displayed in the Wolverhampton workhouse. On that part of the site where the boiler-house was placed there was a settlement through which one of the boilers was affected. A bed of concrete had been placed beneath the premises, but it also sank. After an excavation to a depth of 7 feet 6 inches the cause of the damage was ascertained. There was a peat stratum which originally was 2 feet 6 inches thick, but apparently it became ignited through the heat of the boilers, and in consequence the depth was diminished one-third. Additional concrete will have to be used, and the outlay on resetting the boilers is estimated at 600*l*. In similar cases where the peat is only a couple of feet thick it would be better to remove it before the concrete is put in. Some of the floors of the workhouse are attacked by dry-rot, which is supposed to arise from the obstruction of the openings for ventilation by rubbish.

ETCHING AND ETCHERS.*

TOWARDS the end of the fifteenth century three great events occurred—the discovery of a new world, America, the discovery of printing, the taking of Constantinople by the Turks. The last event gave rise to that great movement in literature and the arts termed "The Renaissance," which, commencing in Italy, spread over the greater part of Europe by the end of the century. As a consequence of the taking of Constantinople, an immense number of refugees arrived in Italy, bringing with them Greek learning and art. The study of the Greek classics became the fashion, and many of the finest examples of Greek sculpture found a new home in the court and gardens of that munificent patron, Lorenzo de Medici. Here Michel Angelo and others received their earlier training.

In the term under review artists were accustomed to express their ideas as studies through the medium of silver-point, chalk, the reed pen and sepia washes. The thought of multiplying these examples had not yet presented itself. Early in the century, however, wood-engraving had been discovered, which later down was followed by that of pictorial engraving on metals, copper, &c. Both Italy and the Netherlands and Germany—as was the case with oil-painting—laid claim to priority in the practice of this art. In Italy it came about as follows.

Anyone familiar with Vasari's "Lives of the Italian Painters," or the art history of the time, must have been struck with the fact of so many artists being put to goldsmiths to receive their earliest training. It was a time of great activity in the chasing and enamelling of gold and silver in connection with armour, medals, vases, &c. One department was termed niellowork, where the goldsmith cut or graved out a design in the gold, the design standing out, the cut-away part being afterwards filled with enamelling. Those who practised this kind of work were called niellitores. They were accustomed to take an impression of their design by means of sulphur. By accident, or perhaps intentionally, a dark substance got used in the place of the sulphur, the result of the impression being the gold standing out from a black background. Finiguerra, a prominent Florentine goldsmith, receives the credit of the discovery (A.D. 1452). A step further led up to engraving proper, so that before the close of the sixteenth century two schools of engravers were in active work, chiefly in copper. An instrument was constructed, admirably adapted for the purpose of graving, called the burin, a sharp, lozenge-shaped point of steel, which was fixed into a wooden handle made to fit into the palm of the hand. The foremost Italian engravers were Mantegna and Marc Antonio, &c.; amongst the German were Albert Dürer, Schongauer, Lucas van Leyden, Altdorfer and Israel von Meckenlen. Although these two schools of engraving arose at about the same time, there was a distinct difference in their work.

The Germans had greater command over the burin, and their engravings show a decision often wanting in those of the Italian school. On the other hand, the works of the latter display greater refinement and grace. The engravings of both schools found their way to Venice, which was at that time the chief business emporium of Europe. Here Dürer, Schongauer, Mantegna, Marc Antonio and others met and interchanged ideas, so that one school reacted upon the other, the effect of which became very apparent as time went on.

It was during the prevalence of these schools of engraving that the method of etching was discovered, but it appears to have come in as an interloper and was not frequently practised. It was only when engraving began to decline about the middle of the sixteenth century that etching came to the front, and this was chiefly due, later on, to Rembrandt, Vandyke, Ostade, Van Uliet and others. It seems curious that etching had not elbowed out engraving at an earlier period, and that the greater freedom of the etching point had not commended itself to those practising engraving. With regard to the comparative merits of the burin and the etching point I shall quote Dr. Haden:—

"Let us compare etching and engraving, the etching line with the burin line. It is the comparison of the pen with the plough. In one case a finely-pointed style, obedient to every movement of the sentient hand—in the other a tool driven by the elbow against an object brought to meet it half-way; in one case suppleness, liberty, rapidity and directness of utterance, and the faculty of keeping pace with the ideas as they are formed. In the other, the com-

bined action of two hands, and the active opposition of two forces—that of the instrument against the plate and of the plate against the instrument. What wonder that the line described by one should be free, expressive and full of variety—by the other cold, constrained and uninteresting?"

"The properties of the etching line are, in point of fact, almost wholly mental; those of the engraved line wholly, or almost wholly, mechanical. The mental properties of the etching line are originality and personality, so that we actually recognise a line of Rembrandt or of Claude, out of which properties again come the qualities of expression, delicacy, colour, tenderness and whatever else the artist is capable of."

Let us turn for a short time to the technical methods of etching on metals and consider the materials required and their uses. These conveniently fall under the several heads of the plate, the ground, the dabber, the etching instrument, the drawing, the stopping-out varnish and lastly the printing.

The artist took a polished plate of copper and covered the surface upon which the etching was to be made with a ground composed of white wax, bitumen or asphaltum, and resin or amber, the plate being first heated, the ground melted, and in this fluid state a dabber, made of a round piece of cardboard, upon which was placed some horsehair, the whole bound round with a piece of taffeta silk, was gently pressed all over the ground in order to make it lie evenly. This being done, and while the ground was still in a fluid state the copper was placed, ground downwards, over some lighted wax tapers twisted together, and sufficiently far off to prevent the flame reaching the wax ground. The smoke from the taper incorporated itself with the ground and was then allowed to set, the result being a beautiful shining black surface. The plate was now ready for the drawing. The drawing was made with a needle or sharp piece of pointed steel fixed into a handle. The artist drew the picture through the wax ground in such a manner as to reach the copper without scratching it. The finer lines were drawn with a fine point, the stronger and broader lines with a thicker point. When finished the picture stood out in brilliant copper lines through the dark background.

The next process was the biting in, by means of the mordant or acid. For this purpose nitric acid was used, half acid to half water. The artist proceeded in what was considered, technically, the most important part of the process of etching. In this way he laid the plate, picture upwards, on a table, and then took some sticks of wax softened in warm water, and built a wall round the plate, after which he poured on the acid. The finer the lines the less time given to the biting. It was therefore necessary, after giving the very short time requisite for biting in the distant parts of the picture, to pour off the acid, and then to paint over the lines bitten enough with a kind of fluid varnish made from some of the etching ground previously mentioned. This was termed the stopping out. This varnish set very quickly and was of such a nature that the acid could no longer eat into the lines thus protected.

The varnish having set, the acid was again poured over the plate for biting into the copper the lines less fine, and so on until the whole of the picture was bitten in. By this process it will be seen that the thicker the lines the longer they were submitted to the action of the nitric acid. The process was a difficult one and much judgment was required, since light and dark lines would be mixed up together, beginning in the middle ground, right up through the foreground of the picture. The whole picture having been bitten in, the plate was again heated and freed from the wax ground remaining on it.

The next procedure was the printing. The ink was of a specially prepared kind, of the same nature as printer's ink but of a finer quality and colour. The ink was applied to the plate and pressed into the lines by means of the "rubber," consisting of close ground woollen cloth wrapped round and round itself in the form of a cylinder and then tightly tied with string. It was important that the ink should be pressed thoroughly into every line bitten into the copper.

This done the major part of the ink was wiped off the still heated plate with a muslin cloth. The artist (for the etchers almost always printed their own plates) then placed some of the ink on the ball of the thumb or the fleshy part of the palm of the hand, and covered over the ink with Spanish white chalk. He then very carefully passed his hand over the plate and detached the remaining ink under the pictures shown out in black on a copper background.

* From a paper by Mr. John Oldham, read before the Royal Victorian Institute of Architects.

Care was taken to procure a special kind of paper, known as Dutch paper. The paper being damped the plate was laid upon it and passed through the copperplate printing press, and a proof obtained.

The process was repeated until the required proofs were obtained, and this was only a limited number, as from the great pressure the lines gradually closed, so that, after thirty or forty had been obtained, the proofs became thin, faint and wiry, hence worthless. Modern science, however, has got over this difficulty. By steeling the plate in an electric bath it is so protected that 1,000 proofs can now be got. These proofs, however, will never give the rich effect obtained before the plate was steeled.

After Rembrandt and his followers the practice of etching by the old masters gradually died out. Speaking roughly, it covered the latter half of the sixteenth century and the earlier half of the seventeenth.

It was not till towards the middle of the nineteenth century that the old art was revived again. The revival took place in England and France and at about the same time. In France it was due chiefly to Legros, Meryon and others. In England to Whistler, Seymour Haden and Philip G. Hamerton. What Ruskin was to Turner and the pre-Raphaelites, such was Hamerton to the revival of etching. He acted as editor of the *Portfolio*, issued by Messrs. Seeley & Co., a periodical devoted to original etchings.

To Hamerton and Haden we are indebted for new methods of work, termed the positive or continuous processes, in contrast with the negative or interrupted processes of the old masters.

As I have already described the old method, I will proceed now to give you some idea of the newer methods, of which Haden has written so eloquently, and to whose writings and those of Hamerton I have been so much indebted in my lecture this evening.

The plate, ground and other requisites used in the older method remain, but are treated differently. The etchers take a burnished plate as before, but in this case protect both sides with the wax ground. The etching ground is made somewhat weaker, though of the same composition as that of the old masters. This is used on the face of the plate, in the manner already described, the back of the plate being covered with ordinary wax. The plate is then attached to the bottom of a bath—either let into the wood, which has been covered all over with several coats of Japan varnish to protect it from the acid, or to an ordinary photographer's glass bath—by means of four small balls of wax.

The Dutch mordant or acid is also of weaker strength than that used by the old masters, and composed as follows:—Hydrochloric acid, 100 grammes; chlorate of potash, 20 grammes; water, 880 grammes. In making it the water is warmed, and the chlorate of potash perfectly dissolved in it first; then the acid is added. The mordant having been prepared, and a little bit of copper added, which turns it a green colour, it is poured over the plate now resting in the bath, so as just to cover it, say, about one-eighth of an inch. The same etching instruments are used as before, but in this method you begin with the lines intended to be darkest, first using a blunt point and keeping the lines rather wide apart, after that gradually proceeding towards the paler work, where one uses a sharper point, and the lines are made closer together. If you calculate your time well and do your work properly your plate will be finished with a perfect gradation when you take it out of the bath, and by having dissolved a little copper in the mordant at starting, the lines will be bitten a dark colour on the copperplate, just as though you were drawing with lead pencil, so that you can see quite plainly your drawing as you go along. The drawing finished, the plate may be taken out of the bath, and you may print a proof at once.

We have said that the mordant is weaker than that used by the old masters, and by this method of work it will be seen that the darkest lines are continuously bitten all through the drawing, until you come to the finest lines, and the work will cover, say, from five to seven hours. If you wish to do it in a somewhat shorter time you may strengthen the mordant. This, however, is unnecessary, since, supposing you can only give a couple of hours to the plate, it may be taken out and put between blotting-paper; the mordant being returned to the bottle, and a record being taken of the time spent, you may resume again the work at your leisure, bearing in mind that the darkest lines require to be bitten for from five to seven hours, and the finest

about a quarter of an hour, the medium lines being graded between the time mentioned.

The advantages of this system are as follows:—
1. Perfect gradation in work. All other systems of biting proceed by stages, usually two or three. This system is one of unbroken gradation from the deepest biting to the palest.
2. It saves the necessity for stopping out, which was a cause of delay and a difficulty in all passages of any intricacy, such as skies seen between branches of trees, &c.
3. It enables an experienced etcher to complete a plate at one sitting, without being delayed by regrounding, proof-taking, &c.
4. Owing to the copper dissolved in the acid before commencing you are enabled to see the work as you go along, as with lead-pencil and pen and ink.

A few words with regard to dry point. The picture is drawn straight away on the copper, without either ground or mordant being used. To do this the etching instrument has to be sharpened at the point similar to that of a currier's knife. When used the instrument cuts into the copper, raising a kind of edge, to the line, which when printed from gives a kind of shadow to each line, and thus adds to the richness of the print. Legros in England and Hellieu in France are two of the greatest exponents of this method.

In concluding, I will add a short extract from Dr. Haden as to the qualifications of the etcher:—

"What, then, is the amount and kind of previous knowledge and skill required by the etcher? It is the sum of all we have been writing about. It is an innate artistic spirit, without which all the study in the world is useless. It is the cultivation of this spirit, not arduously, but lovingly. It is the knowledge that is acquired by a life of devotion to what is true and beautiful—by the daily and hourly habit of weighing and comparing what we see in nature, and thinking of how it should be represented in art. It is the taste which a celebrated painter once said, but not truly, is rarer than genius. The skill that grows out of these habits is the skill required by the etcher. It is the skill of the analyst and the synthesist; the skill to combine and the skill to separate, to detach plane from plane, to fuse detail into mass, to subordinate definition to space, distance, light and air. Finally, it is the acumen to perceive the near relationship that expression bears to form, and the skill to draw them—not separately, but together."

COHESIVE FIREPROOF TILE CONSTRUCTION.

THE elimination of the fire hazard in modern buildings is based upon the principle that all supporting iron or steel girders, columns and beams must be protected from fire by some material which is a poor conductor of heat and not easily disintegrated or injured by high temperatures. Burned clay materials, such as flat, hollow, porous and semi-porous terra-cotta blocks, and certain grades of burned bricks, are commonly employed for this purpose. Owing to the relative lightness of these materials and their high fire-resisting qualities, most steel frameworks of our large buildings are encased in hollow or flat terra-cotta tiles laid in cement mortar. Many of these clay tiles and blocks are burned in the making to 2,000 to 2,500 degs., so that in any fire they will not crumble or crack at a temperature below that to which they were originally subjected.

No great stress is imposed upon the hollow porous blocks used for fireproofing beams, girders and columns, and their crushing strength is not very great. Their function is performed in protecting the steelwork from an excessive interior temperature, while the metal carries the loads of the different floors. The use of hard, flat terra-cotta tiles for certain construction purposes, both to carry the load and to resist any interior fire, has in the last year or two, says the *Scientific American*, assumed an important development. Modern methods of burning and making the terra-cotta tiles have greatly improved their strength and durability, and the better grades of them have been used in a number of buildings in New York city and elsewhere, which fully illustrate the new method of cohesive fireproof tile construction.

In the new Custom House in New York city the large dome surmounting the great interior rotunda is constructed entirely of fireproof flat tiles, and the total absence of any metal for supporting this huge elliptical dome shows the great cohesive power of hard, flat tiles when properly laid up in cement mortar. The dome is 80 by 135 feet in size, and supports on its summit a huge skylight of glass and metal, whose total weight is 140 tons. The tiles used for this purpose are 12 inches in length, 6 inches in width

and about 1 inch in thickness. They are laid on edge and form a perfect curve.

The masonry walls of this rotunda are built of brick up to the lower part of the dome. A massive flat ring of steel is fitted on the top of this masonry and embedded in it, and from this the dome springs. The foundations of the dome are of solid, flat tiles cemented together on their edges, but after a few courses an outer and inner shell is formed. Nine layers of 1-inch flat tiles form the lower courses, but as the curvature of the dome is reached one course after another is omitted until near the middle there are only three layers of tiles for each shell, leaving an open space between them.

A central mid-rib composed of tiles laid flat runs around the dome to strengthen it, and similar ribs of tiles laid flat radiate from the apex of the dome to the foundations. These ribs are joined to the central mid-rib by cement, and all are enclosed by the two shells of the tiles laid on edge. The cohesive strength of tile construction is thus amply demonstrated. Engineers representing a number of structural steel manufacturers intimated before the work was undertaken that it was impossible to build the dome in this way without metal reinforcements of some kind; but the dome has been finished for some months and the heavy skylight placed in position. The lightness of the tiles makes the dome nearly half the weight of another of similar size constructed of metal, while the fireproof quality of the material insures the dome from interior destruction by fire. The tiles having been burned in the making do not warp or shrink after being placed in position, and elaborate decorations can be made directly to them without danger from cracking or warping.

A similar dome of less size and ambition has been built on the new Madison Square Presbyterian church, which recently has been completed. The same size flat tiles are used there, and the dome is built and surmounted by a small tower. The crushing strength of the tiles is upward of 2,000 pounds to the square inch, and their cohesive strength is dependent chiefly upon the quality of the Portland cement used in building the dome. The major axis of this new dome is only 52 feet, but its shape and artistic appearance from either the inside or outside make it remarkable quite as much as the decorations placed on it by the architect. The dome springs direct from the walls of brick, and it thus completes a remarkable building independent of any iron or steelwork.

Within the past few years a number of other similar domes of this same general character have been completed. In the new library building of the University of New York there is one with a major axis of 70 feet, and over the rotunda of the University of Virginia the Guastavino dome of flat fireproof tiles laid edgewise has a diameter of 69 feet. The Hall of Sciences, in Brooklyn, has a dome of flat tiles without any metal supporting work of 60 feet in diameter, and the new Minnesota State Capitol one of similar dimensions. The dome over the Bank of Montreal building is 72 feet in diameter, and is the largest, next to the new one over the rotunda of the New York Custom House, yet finished by this new method of cohesive construction.

The construction of such fireproof non-metal-supported domes represents a special branch of masonry designing which has slowly reached perfection in this country. It is based upon the principles of the early Roman architects, who used heavy bricks and stones for their work; but with superior tiles and cement mortar to work with the modern designers have secured strength and rigidity with materials much lighter and absolutely fireproof in character.

The high degree of skill and mathematical designing required to construct domes, arches and stairways of tiles by the cohesive system is probably even better illustrated in the two pairs of stairs built in the new Custom House facing Bowling Green in New York. These stairs spring from the basement of the building and terminate at the roof. No metal whatever is employed for supporting them. On the contrary, heavy balustrades of metal, and equally heavy marble treads, only add to the dead load carried by the tiles. Rather larger tiles are used for the stairs than for the dome construction, but they are all light and apparently frail for this work. From the basement to the main floor a circular wall of brick masonry is built, and the tiles are attached at one end to this wall; but each semicircular flight depends for its strength and rigidity upon the cohesive strength of the tiles and the scientific strength of a curve when the load is so distributed that the pressure to the arch is continuous. Above the main floor each flight springs to the floor above, without any support other than

that derived from the top and bottom. The stairs are formed by a number of thicknesses of flat tiles at the base, which gradually diminish toward the middle. the arch and then thicken again towards the top. of

The construction of spiral and semicircular stairways with hard flat tiles requires independent and careful study of each individual case. No definite rule or principles can be laid down to apply to all cases, but each problem has to be worked out by itself. The combination of the spring of the arch with the continuous curve under each platform to adjust the adjoining flight are questions of mechanical skill. Such stairways of hard, fireproof clay tiles are constructed to carry loads which will suffice for any kind of public buildings, and those recently constructed in the Custom House (or rather in the course of construction at this writing) are designed to carry heavy marble treads and ornamental iron and bronzework besides the weight of those who will constantly use them for ascending and descending. The fireproof quality of such stairs is of particular force in view of the modern effort being made to eliminate everything possible from public buildings which will crumble or disintegrate when attacked by a hot interior fire. The difficulty of protecting an iron-stairway by terra-cotta casing as commonly practised in protecting beams and girders is quite apparent. If left unprotected a sharp interior fire will cause a collapse of the stairs and greatly increase the damage to the building. A tile stairway, on the contrary, would not be affected by a fire unless the temperature reached 2,000 and more degrees, and a collapse would not follow.

The use of the cohesive tile construction for floors and ceilings is well illustrated in two other notable buildings recently built in New York. The dome ceiling of the new Tiffany building is constructed of hard, flat tiles laid on edge and sprung from rotunda columns and terminating in a large skylight. In these dome ceilings the curve is less than in the domes, and the effect is of a slightly arched ceiling of great beauty. The decorations are sometimes laid directly on the tiles and in other cases ornamental faced tiles are cemented to the hard supporting tiles for interior effect. In the new Gorham building all the different floors and ceilings are made of hard tiles. A series of arches spring from the steel columns and terminate in points in the ceiling. The compression on the tiles is uniform, so that the load is carried without any undue stress upon any part. The tiles are laid on edge, with several courses forming the arch, breaking joints at each course, and cemented together with the best Portland cement mortar. The decorations are either made directly on these fireproof tiles or ornamental tiles cemented to them. No metalwork is employed to support the dome ceilings other than the series of steel columns from which the arches spring. No steel reinforcements or tension rods whatever are employed in the construction. The remarkable lightness of the floors and ceilings built in this way is one of the chief virtues ascribed to the new method of fireproof building. The carrying capacity of a floor built of cohesive tile masonry is certainly sufficient to warrant their construction in some of the finest public and commercial buildings of the country. As an interesting development of the fireproof question, cohesive tile construction is without a peer, and its adaptation to new work and fields is a matter that should be of inestimable value to the building trades. In cases where lightness of structure is an important consideration hard flat tiles may prove far more desirable than iron skeletonwork, and also where it is desirable to use fireproof clay materials owing to the difficulty of covering the ironwork with terra-cotta.

SOCIETY OF 25 PAINTERS.

At a general meeting of the Society of 25 English Painters it was decided to alter the title of the Society to The Society of 25 Painters, so rendering all artists who are born British subjects eligible for election as members. The committee have made arrangements with Messrs. Marchant & Co. with reference to their exhibitions, which will henceforth be held at the Goupil Gallery, 5 Regent Street. Several new features will be introduced, such as a summer exhibition of sketches, &c., full details of which will be announced in due course.

All the members of the Society have been invited by the Mayor of Barcelona to exhibit at the forthcoming international exhibition in that city. The Society's exhibition at Berlin, which has just closed, has been very successful, and is being followed by exhibitions [at Düsseldorf, Munich, Hamburg and other German cities.]

OILS, VARNISHES AND MEDIUMS USED IN THE PAINTING OF PICTURES.*

WHILE in the past various mixtures were used by artists for painting, some of which are only obscurely understood, the necessary mediums for modern painting are comparatively few.

The old painting in beeswax, which has proved remarkably durable, is no longer practised, and tempera painting with an egg medium is only used now and then. There are in this connection certain unsolved problems, such as the real nature of the medium used by Van Eyck and his immediate successors, which are of historical interest, but which I do not propose to discuss here. The medium in which the pigments are mixed must be closely related to the technique adopted by the painters of the day, and it is not at all probable that the medium used by Van Eyck, while united to his technique, would be of the slightest practical use to the modern painter. An artist's medium, then, has to serve more than one purpose. It must attach the pigment to the paper or canvas on which the picture is painted; it must facilitate the use of the pigment by the artist, and it must bring out all the qualities of translucency, and so on, which the pigment possesses. It should also, as far as possible, protect the pigment from change and injury, either mechanical or chemical. The simplest example of such a medium is the mixture of gum arabic and water, used in water-colour paintings. The gum arabic serves to attach the pigment to the paper, while the water gives the necessary facility to the pigment under the brush, and the qualities of the pigment are developed by thicker or thinner washes on the white paper background. Such a medium, however, does nothing to protect the pigments used from change, and has a limited though beautiful range of expression.

Painting in oil is practically the only other method used by the present day artist, and it is to painting in oil that this discussion will be devoted.

In selecting an oil as suitable for artists' purposes it is necessary to choose what is known as a "drying oil." If, for instance, pigments are ground in olive oil the surface would never dry, and it is, therefore, useless for the purpose. There are certain vegetable oils which have this property of drying and which are, therefore, suitable for artists' purposes. I shall only refer to three here, linseed oil, poppy oil and walnut oil. There is no need to trouble you with the chemical composition of these drying oils, but it is important that the nature of this drying process should be clearly understood. These oils do not dry in the ordinary sense of the term at all. They undergo a process of oxidation when exposed to the air, which converts them from a liquid condition into a tough elastic solid, a solid which slowly undergoes further oxidation, becoming brittle, hard and resinous. It is then to this process of oxidation that their peculiar properties are due.

These oils are obtained from the seeds or nuts, and are present in those bodies as part of the reservoir of food supply for the young embryo of the future plant.

The oil from linseed is obtained by crushing, grinding and pressure, and in order to increase the yield the ground mass is heated as well as pressed, thus obtaining what is known as a hot pressed oil, which is subjected to various processes of refining and bleaching. Personally, while regarding such an oil as quite suitable for house painting, I doubt very much the wisdom of using it for artists' purposes. The hot pressing results in the presence of many impurities which are removed by the addition of sulphuric acid. The chemistry of the whole subject of painters' vehicles is so obscure that it is as well to cling to tradition where possible.

The linseed oil of the earlier centuries was cold-pressed linseed, and was refined and bleached by the simple process of exposure to air and sunlight over water. These methods yield a beautiful oil, and should be adhered to for artists' purposes.

Poppy oil is obtained from the seeds of the opium poppy (*Papaver somniferum*) by crushing and pressing, or by other means of extraction, and is easily bleached. It is often used for grinding with whites or delicate blues. It dries more slowly than linseed oil, but has the advantage of being almost colourless.

Walnut oil is obtained from the common walnut (*Juglans regia*) by allowing the nuts to decompose partially

and then pressing, and can be obtained almost colourless. It was largely used by the early Italian painters as a drying oil. There are other drying oils, but they are not of special interest to artists.

Having briefly discussed the three drying oils commonly used for artists' purpose, we now go on to consider some of the other vehicles and mediums. The pigment having been ground stiffly in oil is supplied to the artist, who may thus dilute or mix it further, and we shall proceed to consider the materials he may use.

In the first place, he may merely add a little more of one of the oils already referred to. In case, however, that he wishes his picture to dry faster, he may use as a medium instead of raw oil boiled or drying oil.

The property of the boiled oils depends upon the fact that if, for instance, linseed oil is heated for some time with certain compounds, more usually either compounds of lead, such as lead oxides or lead acetates, or compounds of manganese, such as manganese borate or resinate, it becomes partially oxidised, and if painted out on a surface will "dry" much more quickly.

Of the two methods of preparing drying oils described above, the use of manganese is, I think, preferable, and for this reason. A certain amount of the substances used dissolves in the oil, and consequently an oil prepared with lead dryers contains lead in solution, and is very easily darkened by impure air containing sulphur compounds such as sulphuretted hydrogen. It is, therefore, probably better to keep such oils out of modern pictures which are exposed to the impure air of cities.

Besides diluting with oil the artist may prefer to dilute with a medium which will evaporate and leave the layer of oil originally present behind. The mediums most commonly used for this purpose are either turpentine or petroleum. Turpentine, which is obtained by distilling the natural gums of the various pines, is a very suitable medium, as it not only evaporates easily, but also assists in the oxidation of the oil. It has been objected to turpentine that it does not evaporate clean, but always leaves a slight resinous residue behind. This is quite true, but the amount of this residue is very small, and, as far as my experience goes, it gets fairly hard in time, so that there is probably no objection to its use on this ground.

The petroleum oils have the advantage when properly rectified of evaporating quite clean and leaving no residue. I have said when properly rectified. It is important before using such a medium to moisten a piece of blotting-paper with it and expose it to the air for a short time. If properly rectified the petroleum evaporates completely, leaving no greasy stain behind.

Artists sometimes forget the real property of these mediums, and then complain afterwards that the pigment does not adhere properly to the surface of the picture. The amount of oil used for grinding different pigments varies very considerably. If the ground is slightly absorbent, and the pigment stiffly ground and diluted by the artist with petroleum, the oil in the pigment dissolves in the petroleum and passes freely into the absorbent ground, leaving the pigment when the petroleum has evaporated without sufficient oil to bind it to the canvas. This may happen with one pigment but not with another, if in the original grinding more oil has been necessary to get a good consistency.

Having now dealt with the more important diluting mediums, we will consider next the question of varnishes. A very large variety of gums or resins are now available for varnish making, but the number used for artists' purposes is not great.

Varnishes may be conveniently grouped into two divisions, the one called spirit varnishes and the other oil varnishes; the spirit varnishes are prepared from the softer and more soluble gums by dissolving them in some medium which will evaporate and leave a layer of pure resin behind, such as turpentine, alcohol, or petroleum. The varnish artists are most familiar with is prepared by dissolving gum mastic in turpentine. By evaporating, a layer of mastic is left behind. Shellac is usually dissolved in alcohol, and there are also petroleum varnishes in use.

Such spirit varnishes are brittle, weak and easily dissolved or removed. They should therefore form no part of the body of a picture, but may be used to varnish a completed picture when thoroughly hard, mostly as a protective transparent coating which can be easily removed without injuring the painting beneath. Mastic varnish, for instance, can be removed by lightly rubbing with the tips of the fingers, the powder of the resin largely assisting

* A paper read by A. P. Laurie, M.A., D.Sc. (Principal of the Heriot-Watt College, Edinburgh), before the Applied Art Section of the Society of Arts.

They are apt to bloom, in which case the bloom can be removed by a damp cloth, and some hold that they tend to crack the picture beneath; I have found no proof of this, however.

We next come to the oil varnishes. Oil varnishes are or should be made of the harder gums which will not dissolve freely in turpentine or alcohol. To make an oil varnish the gum is fused and the hot oil added, and the whole heated until a drop placed to cool in a glass plate cools clear. It is then diluted with turps. To prevent too slow drying a drying oil may be used, or driers added and heated with the varnish. While thus the fundamental process is simple, in practice great technical skill is required. But again, either manganese or lead driers can be used, and I advise for artists' use manganese driers, although the varnishes so prepared do not in my experience dry so quickly. The number of gums available, their means of supply, names and properties form a large and confusing subject, especially as no fixed and clear nomenclature has been arrived at.

For artists' purposes a hard gum should be utilised, such as Zanzibar or Sierra Leone copal, or the hard kauri gum from New Zealand. Carefully selected pieces, light in colour, should then be carefully fused and incorporated with pure linseed oil. Amber is a very hard gum of high melting-point. The main trouble in using it is the difficulty of preventing it from getting too dark on fusing. This can be overcome, but in so far as I have been able to test its properties, it has no advantage over the kauri resins or copals. These, then, are the principal mediums in everyday use for painting oil-pictures. I have excluded all special fancy mediums, as I do not know their composition. They may be quite harmless, but I object to them as a doctor objects to a patent medicine. An artist, if he is wise, will only use such mediums as are of known composition and have stood the test of time and experience.

We shall next, then, proceed to consider various problems which arise in connection with these mediums, and which, I may frankly say, are far from being solved.

In the first place, then, how far do pigments act chemically on each other when mixed in an oil vehicle? To take a typical example. Will a mixture of white lead, which is so sensitive to sulphur compounds, turn black when mixed with vermilion (sulphide of mercury) or with cadmium yellow (sulphide of cadmium)? It is sometimes stated in the text-books that these pigments must not be mixed together; but all practical experience is against this view, and when we examine a pigment ground in oil under the microscope, and notice how the particles are each protected by a layer of oil, it is difficult to see how, unless the pigment is soluble in the oil, any action can take place. There is one well-known case when such action does take place—the turning brown of a green made with emerald green and cadmium yellow; but this, I take it, is due to emerald green dissolving slightly in the linseed oil. I once made an experiment which, I think, is of interest in this connection. I rubbed out some cadmium yellow ground in oil on a glass plate, allowed it to dry, and then coated it with a layer of linseed oil, allowed this to dry, and then coated this with emerald green in oil. At the end of six months the combination had turned brown, and a section under the microscope revealed the fact that the top layer of cadmium yellow had turned black. This must have been due to the solution of the copper in the emerald green in the linseed oil and the slow diffusion of the copper salt molecules through the solid oil, with formation of black copper sulphide. It is evident then that pigments soluble in linseed oil will slowly diffuse through the solid oil and attack other pigments, but if they are insoluble no change seems to take place.

The next question is, How far does the oil protect pigments from external influences, air, moisture and injurious gases? I read many years ago a paper dealing with this subject at the Society of Arts.* Ignited sulphate of copper is a white opaque powder which is intensely hygroscopic, and in attracting moisture forms a transparent green hydrate. If, then, it is ground up with various media, which are allowed to dry in dry air and then exposed to moist air, the white opaque enamel will become green and transparent if moisture penetrates. One result was to show that while pure resins dissolved in "turps" formed moisture-tight surfaces, oils and oil varnishes were all quickly permeable.

The same is true of other gases. Sulphuretted hydrogen quickly blackens white lead in oil through even an oil varnish; but if the white is ground in

Canada balsam, and then varnished with Canada balsam, the white is protected. Verdigris forms a permanent green in such a medium. It does not, however, stop though it checks the fading of crimson lake, showing that there is probably some decomposition of this colour in sunlight apart from air and moisture.

It is evident, then, that while a freer range can be allowed to the oil-colour than to the water-colour palette, it is safer to select pigments which are permanent in themselves and not to trust to their protection by the oil from change.

The next question to be considered is the durability of the oil and varnish surfaces themselves. This has not received very much investigation as far as I am aware. I have been recently making experiments with a view to getting some comparative test for the combined toughness and hardness of a varnish. The method is to place the varnish painted out on a glass plate and dry under a blunt steel point, the pressure of which on the varnish can be increased by known amounts with a spiral spring.

The varnish is then drawn under the point, and the pressure is increased until the varnish shows a clear definite scratch. Under this test the brittle spirit varnishes break down at a pressure of 100 grammes on a steel point of 1 mm. radius, oil varnishes made from soft gums at from 300 to 500 grammes, and oil varnishes made from hard gums at from 900 to 1,200 grammes. Moreover, the character of the scratch is very different. Varnishes with an excess of resin in them, and therefore made from soft, easily dissolved gums, give a splintery scratch, while the tough oil varnishes, made from hard gums, give a tear. On exposure to weather during winter the varnishes are all soon reduced to a brittle surface which scratches at 100 grammes; in summer, however, they are improved by exposure. This clearly indicates that frost has probably much to do with this, and it is worthy of further investigation. It is easy by this machine to pick out a good varnish for the artist to use as a medium; and if this is done, no doubt the life of the picture, if kept under proper conditions, will be very much increased.

The next question to be considered is the occasional and capricious cracking of pictures. The explanation of this has, I confess, so far completely baffled me, but there are certain matters of interest in connection with it worth mentioning.

The great difficulty I have found in investigating this matter is due to the fact that I have been unable, under any condition, to produce cracking. The first experiment I tried was more than twelve years ago, when I painted out two, three and four coats following each other quickly as soon as the last coat was sufficiently dry on the surface, of flake white (1) ground stiff with oil; (2) diluted with more oil; (3) diluted with copal varnish and (4) diluted with petroleum.

The same set of experiments were repeated with lead sulphate and zinc oxide paint, and with pure zinc oxide, thus making in all forty-eight different panels representing the different conditions. They are all perfect and show no signs of disintegration to-day. I have also tried painting on ordinary primed canvas with yellow ochre, and then as soon as it was sufficiently dry laying over it strips of amber—a quick drying pigment. Result, no cracks.

I have also tried the following combinations:—Undermost oil paint + mastic or pure mastic; second coat oil paint; third coat oil paint + mastic, amber + mastic, then yellow ochre, then mastic varnish; oil paint + olive oil, amber in oil on top, mastic on top, shellac varnish on top, and other similar combinations. All were hurried, no proper time for drying was allowed, and after twelve months they were free from cracks.

In no instance did any crack, with the exception of the shellac varnish on the paint mixed with olive oil. I noticed, however, one curious result. The yellow ochre on the top of mastic varnish cracked while still wet, owing to surface tension effects, but changed no more after it was dry.

These experiments then were all negative in their results, and certainly eliminate many of the causes to which cracking is supposed to be due.

I had the good fortune to be presented with two pictures which had cracked badly within a few months of painting. In the first picture mastic had been used as a medium, and the cracking was confined to the parts where thin liquid painting had been done and mastic probably freely used, as the surface here was hard and brittle. The canvas was of very poor quality, hardly closer in mesh than coarse muslin. A section through a crack when placed under the micro-

* *Journal*, vol. xxxix. 1891, p. 392.

scope showed the crack to be merely through the upper painting, and to be a broad crack with straight edges perpendicular to the painting surface. The priming had not cracked, but seemed to be drawn out under the crack.

The second picture was painted on a closely-woven canvas which had been lightly sized and thinly primed by the artist with a mixture of pigments and linseed oil. The cracking was confined to the white masses of hard dry paint in the sky. A section showed that these cracks also formed broad cracks with perpendicular edges without injury to the undercoating of paint. The undercoating of paint did not, however, seem to be properly attached to the canvas, a layer of spongy disintegrated material apparently having formed in some way. This condition of things prevailed all over the canvas and suggested that, owing to some disintegration between the canvas and the lower coats of paint, the coats of paint had been stretched, resulting in cracking of the upper coat where it was not elastic enough to yield. In order to get some light on the possible causes of cracking, I determined to measure the actual movements taking place in the canvas itself under different conditions. For this purpose I attached a strip of sized canvas by one end to a glass cylinder, and weighted the other end so as to keep it taut over the cylinder. A platinum wire was firmly sewn to the canvas across and projecting out each side, and two little glass rods attached to the glass as indicators. The length of the canvas from the attached end to the platinum wire was 2 centimetres. By measuring the distance between the glass rod and the platinum wire it was possible to measure any expansions or contractions of the canvas itself.

By measuring at both ends and taking a mean any twisting of the canvas was eliminated. On first measuring, the average distance between the glass rod and the platinum wire was .45 of a millimetre. The cylinder was then enclosed for twenty hours over strong sulphuric acid so as to dry the canvas thoroughly. The distance had now increased to .55 mm., showing a contraction of the canvas on drying. It was now kept for twenty hours in an atmosphere saturated with water vapour.

At the end of this time the readings showed a distance of .28 mm., showing a total expansion from dry to moist air conditions of .27 mm. On again replacing over strong sulphuric acid the distance increased to .57 mm., showing a change in length of .29 mm., or, taking the mean, of .28 mm.

The canvas was now painted thickly with yellow ochre and put back in the sulphuric acid and allowed to dry. After one day the distance between the points was .54 mm., and after thirteen days when paint fairly dry it was .577 mm., showing very slight changes in length during the drying of the paint. After twenty days the distance between points was .57 mm. On now putting into saturated water vapour the distance between the points became .36 mm. instead of .28 mm., showing a distinct and definite contraction on the original canvas.

A coat of umber was now laid on the ochre and allowed to dry in saturated air. In three days the umber was dry and the distance between points was .34 mm. On now putting back in dry air a further slight contraction took place, the distance between the points becoming .66 mm.

A coat of yellow ochre was now put on and left over sulphuric acid; at the end of seven days the reading was .73 mm. and at the end of a fortnight .72.

These figures are a little difficult to follow, but leaving out small fluctuations they bring out the following facts very clearly.

In the first place, the total expansion from dry to moist air of the canvas tested was .28 mm. for 2 cent. length, or for 1 cent.—that is 10 mm.—it was 1.4 per cent. In the second place, the drying of the thin layers of paint produced a total contraction of the canvas amounting to about .16 mm. This contraction did not necessarily show itself while the paint was drying under fixed atmospheric conditions, but as soon as the canvas was set moving by change in atmospheric conditions it asserted itself.

It is of interest to compare the magnitude of these movements with those required to produce a badly cracked picture.

The cracks in the picture mentioned above varied in diameter from .12 mm. to .3 mm. roughly averaging .2 mm., and measurements in different directions showed an average of about twelve cracks to 10 centimetres, equal .24 mm. per centimetre, or about double the total expansion of the canvas, as tested.

After nine months the strip of canvas painted as above

described was alternately put over sulphuric acid and over water some two or three times, expanding and contracting freely but without cracking the paint. Another possible source of mischief had to be investigated, and that was the freezing of a damp canvas. Two pictures were taken, one a canvas which had been primed twelve months before with sulphate of lead and zinc oxide, the other a portion of canvas previously described which had twelve months before been coated with yellow ochre and then when only just dry on the surface coated with umber. After twenty-four hours in saturated air they were kept some four or five hours in a freezing mixture. No cracks developed and sections showed all coats firmly adhering.

While, then, the result of the experiments has failed to reveal the cause of cracking in the pictures examined, considerable negative evidence has been accumulated which should give us confidence in modern methods of painting. Cracking seems to be due to an expansion of the underlayers (possibly due to the action of moisture and frost) which shows in cracks when the top coat is hard either from excess of pigment or from the presence of a medium like mastic.

On the other hand, a sound canvas properly sized and primed and painted with pure oil and good oil varnishes, with the exclusion of fugitive pigments, seems to withstand very severe treatment without appreciable injury.

There is also very little evidence to confirm the usual statements about expanding surfaces when the paint is drying under normal conditions.

ROMAN MANCHESTER.

THE excavation committee of the Manchester and District Branch of the Classical Association have addressed the following statement to the *Manchester Guardian* :—

As the excavations in Duke Place are nearing their conclusion, your readers may be interested to learn the historical results that our work so far has rendered probable, and the outstanding questions for which we hope to find more complete answers during the remaining weeks. We wish also, as both the light and the weather are now favourable, to make arrangements by which the elder pupils of as many schools in the district as possible shall have an opportunity of being taken over the site under competent guidance before it is closed.

The most striking fact which has come to light since the discovery of the western wall is that some part at least of the camp was destroyed and subsequently rebuilt. The first set of buildings included some very solid work, as can be seen from the remains of sandstone walls and in places of a sandstone floor lying some 6 feet below the present surface. But these first buildings would seem to have had no very long life, so far, at least, as we may judge from the foundations which we have as yet recovered. The earth immediately above these first stone foundations contains very few remains indeed, and seems to have been spread deliberately over the ruined buildings; a great part of it consists of a layer of clayey earth at least a foot thick, which must have been laid down to provide a solid and level base for further operations. The quantity is remarkable; as Professor R. C. Bosanquet remarked, "It must have been brought here in great cartloads," and this seems to imply both a considerable force of men, perhaps with a troop of captives, and a definite intention of prolonged occupation.

Some curious features in the foundation of the western wall also point to a process of reconstruction, or possibly to the conversion of a clay rampart into a wall. What we should greatly like to ascertain about this stage in the history of Manchester is—(1) When were our first camp-buildings destroyed, and (2) How? The literary record, as everyone knows, is absolutely silent, but in the finds we have made in the stratum above the clay, which is fairly rich in small remains, we have the beginning of an answer to the first question, and before we abandon the work we shall be disappointed if we cannot at least find some suggestions towards answering the second.

The sandstone floors which we have uncovered at the higher level (some 3 feet below the present surface) have long been familiar objects to visitors at Duke Place, though we are still anxious to find more evidence of their extent and purpose. Here we need only mention the more important of the objects which have been found above and in this floor stratum. Besides several bronze fibulae or brooches of different designs, some more fine fragments of

Samian pottery, and various interesting stones—none, alas! inscribed—Mr. Phelps has recently secured four or five coins, none of which can have been struck before 117 A.D. nor after 176 A.D.; one, a rather rare bronze of Antoninus, was certainly struck in 145 A.D. Two of them are of the Emperor Hadrian (117-38 A.D.). All of them have been through fire, and we are greatly indebted to the skill with which Mr. J. R. Hardy and Mr. Phelps, by chemical and mechanical means, have recovered for us the types from beneath a mass of corrosion. If the *prima-facie* inferences suggested by these finds, combined with the common length of life of a Roman coin outside hoards—which the British Museum authorities estimate at fifteen years—are confirmed by further evidence, we shall have probable grounds for thinking that the reconstruction of the buildings took place either before or during (hardly later than) the reign of Hadrian, and that some part at least of the second series of buildings in the north-west corner of the camp, which is all that our Duke Place site covers, may have been destroyed by fire somewhere about the time of Marcus Aurelius (161-80 A.D.). It is unfortunate that the coins of 211 found just inside the west wall were not noticed until the rubble was being moved on the surface, so that we cannot be certain that they came, as they seemed to, from the sand below the clay; but whatever inference might be drawn from them would apply mainly to the wall. It is a tempting but at present unsafe conjecture to suppose that the wall was built instead of a clay rampart, at the end of the second century A.D., to protect the camp from such sudden raids from the Brigantes of the hills as had (if one is to guess again) caused the fire or fires from which our coins on the camp floors have suffered. The camp at Brough was probably visited by Antoninus (138-61 A.D.), and rebuilt under Severus (193-211 A.D.).

So far as we can judge at present it will be desirable to continue the work till about the end of April; Messrs. Beattie have very kindly extended our time till then. For the next fortnight the committee have happily secured the kind help of Mr. H. L. Jones, M.A., head-master of Willaston School and a member of our own branch of the Classical Association, who has been for some years Mr. T. Ashby's right-hand man in the well-known and remarkably successful excavations at Caerwent. The work, therefore, will now be continuous. Mr. J. J. Phelps, to whom the excavation is already deeply indebted, has kindly undertaken to be frequently present, and other members of the committee will attend from time to time, though the work on the different parts of the report (which will be edited by Mr. F. A. Bruton) and the pressure of ordinary duties have at length compelled one after another of us to relinquish an active share in the supervision.

One very welcome accessory of our work has been the number of private collections of Roman coins found in or near Manchester which have been placed at our disposal, many of which have never been published before. Some account of all these, and of any others that are submitted to us, will be given in the report. We may perhaps mention in particular an interesting coin found in Castlefield (belonging to Sir Lees Knowles), whose superscription mentions the five emperors of the year 337 A.D.; and the great hoard found in digging foundations for Knot Mill Station, now the property of Mr. T. Hodgson, of Buxton, containing no less than 320 pieces, one of them an Iberian coin, of Celsa, in Spain, of the last century B.C. The owners of any unpublished Roman coins found in Manchester are asked to communicate with Professor Conway, Draether, Didsbury, as soon as possible.

Head-masters or head-mistresses of secondary or primary schools in or near Manchester who would like their elder pupils, in parties of not more than twenty-five, to be taken over the excavations in the course of this month are asked to write to Mr. J. J. Phelps, 46 The Park, Eccles, who has very kindly consented to receive such applications and to arrange, so far as may prove possible, for a member of the committee to be present. Such parties will not be admitted without a previous arrangement, and must always be in control of a responsible teacher.

We are glad to be able to add that, unless the course of the excavation should take some unforeseen turn, the generous interest in the work already shown by the Lord Mayor and citizens of Manchester renders it unnecessary, at present at all events, to ask for further help. We should probably have been obliged to do so but for a second subscription of 5% from Sir Lees Knowles and one of 25% from Professor Schuster, for both of which we are cordially grateful. The total of the fund subscribed is about 438%.

Finally, we may take this opportunity of announcing that all the objects of interest found by us in the excavation will be handed over to the Old Manchester Committee, which has recently added four representatives of the Classical Association to its number.

FITZALAN SQUARE, SHEFFIELD.

THE City Council of Sheffield are about to spend, if supported, 11,618% on the improvement of Fitzalan Square, the architects of Sheffield having combined in preparing a plan. The present tramway offices and conveniences, says the *Sheffield Daily Telegraph*, are to be removed, and underground conveniences constructed. A cab-stand for six cabs is to be constructed on the east side of Market Street. In place of the present tramway lines in the Square tramway lines, to be used as sidings, will be substituted, in accordance with the scheme of the general manager of the Tramways Department, on the east side of the proposed central oval close to the proposed new footpath (outside the balustrade surrounding the oval), which will also serve as a platform for tramway passengers. The sidings will be so constructed as to be available for linking up with tramways to be laid in Flat Street if hereafter found desirable. The estimated cost of the proposed works is as follows:—Laying-out of centre, in accordance with the design submitted by the Sheffield Society of Architects and Surveyors, exclusive of fountains and statue, 2,000% ; conveniences (to be charged to health committee) 3,300% ; paving and sewerage Fitzalan Square, 2,021% ; paving and sewerage Baker's Hill, 872% ; tramways special junctions (to be charged to tramways committee), 1,950% ; sidings, cross-overs, spare line and paving of tramways (to be charged to tramways committee), 1,475% ; making a total of 11,618%.

The best thanks of the Council are tendered to the Sheffield Society of Architects and Surveyors for the trouble and care they have displayed in preparing the designs for laying out the centre of the Square.

A PATCHWORK CHURCH.

IT is easy to overlook Warburton Old Church altogether. If you come from the direction of Lymm and ask for the church, not knowing that there are two (says the *Manchester Guardian*), the people point out an obviously modern building consisting mainly, it would seem, of tower. The course to take is to cross the bridge over the Bollin by the eighteenth-century mill of weathered brick and follow a lane that turns sharp to the left from the high road. At the end of half a mile or so you are at the cross roads in Warburton village, with a pair of suspiciously new-looking stocks before you, at the foot of the steps and pedestal of a ruined cross. A finger-post marked "Old Church" points the way along a street with houses of ancient thatch, all sleepy with age and quiet. A little further and there is the church, with its homely tower of brick grown thick with ivy. It looks indescribably squat and barnlike at the first glance, but quite in keeping with the sedate old hamlet and queer in every stone.

The old place is a strong piece of patchwork, and is a prime curiosity among Cheshire village churches. It suggests the notion that it was built anyhow and with anything that came to hand. The tower is weathered brick, but the south wall of the nave and the west end are of stone. And when you turn the corner from the west door you come upon a north wall composed of fine timber and plasterwork. This last is certainly the oldest part of the structure, and is probably of the fourteenth century. The stonework dates from the middle of the seventeenth century, the brick early in the eighteenth. The outer effect of the whole is that of a jumble of architecture which is almost violently picturesque. The history of the church is vague enough, but the first building seems to have been the chapel of a priory of Premonstratensian canons, who were certainly settled at Warburton in early Norman times. Afterwards the Warburton priory was merged in the abbey of Cockersand in Lancashire, where the Premonstratensians became established late in the twelfth century. There are faint memorials of the monks. A field down by the river is still called the Abbey Croft, and the splendid stone coffins in the church date most probably from those days. The church has been patched and altered through the centuries, and its present state would puzzle an architectural expert to explain. What can be done with a building

so delightfully defiant of all rules, and which does not even keep to the straight, but lurches here and there at surprising angles?

The interior is even more quaint. It has a kind of beauty in disorder which is quite different from the impression of dignity given by stately column and aisle. Huge rough-hewn timbers form the rudest of arches at the entrance to the choir, and support the shingle roof that covers the church. It is all far more primitive than any other of Cheshire's timbered churches—Peover, for instance. The brown worm-eaten timbers that serve for columns seem to have been merely roughly-shaped by the axe, and have many holes and protuberances. Curious hat-pegs are fastened to them, formed of pieces of buck's horn, and old supports for lamps and candles stick out also here and there. The church was once perhaps cruciform, but it is hardly possible now to trace a definite shape. Lying on the worn floor by the side of the choir are the stone coffins already mentioned; in the biggest of them "a very large skeleton" was found. The pulpit has a Jacobean look; it is formally carved. The massive font is seventeenth century, its wooden cover Elizabethan. Through the little windows—some of them askew—one looks out into a pretty churchyard where the trees are well on the way to leaf. The general air of the interior is that of plain simplicity, which is not marred by the indifferent glass of the east window. The homely mixture of styles and periods is very captivating; one feels the church has become what it is through the constraint of use, and it has therefore the beauty of a thing that has been long worn. Services are still held in it.

NEW COUNTY HALL.

THE following supplemental notes for addition to the conditions are issued to competitors for designs for the new County Hall, London:—

(a) Any further information required by competitors must be applied for to the assessors and addressed to the County Hall, Spring Gardens, London, S.W., in the form of separate questions on or before Wednesday, May 1, 1907, after which date no further questions can be considered.

(b) Those questions which it is necessary to answer will be replied to, and the information supplied to all competitors; such replies will then form part of the conditions.

(c) For the immediate information of competitors the scale for the drawings for the preliminary competition has been definitely decided by the Council to be 16 feet to an inch, and in view of the possibility of most of the competitors having considerably advanced their designs no alteration in the scale can now be made.

GENERAL.

H.R.H. the Prince of Wales will on the 23rd inst. open the new buildings of the University of Glasgow, which are to be devoted to the departments of physiology, materia medica, forensic medicine and public health, and of natural philosophy. The buildings were designed by Mr. James Miller, A.R.S.A., and have cost between 70,000*l.* and 80,000*l.*

A Stained-Glass Window has been erected in Worcester Cathedral as a memorial of Sir Douglas Galton, K.C.B., who rendered service as a sanitarian in designing military hospitals and other works.

Professor Ray Lankester will retain his position as Director of the Natural History Museum at South Kensington, the rule governing the Civil Service which would have placed him on the retired list having been abrogated.

The Royal Scottish Academicians have decided to remove from the exhibition the large picture, "The Misses Wilson," by Mr. Sargent, R.A., which had been lent for a limited period. Its place will be filled by the equestrian portrait, "Olivarez," by Velasquez, lent by Lord Elgin.

A Floating Dock is to be constructed at Aberdeen in place of the graving dock, at an estimated cost of 64,700*l.*

The Bishop of Stepney has accepted the dedication of Mr. T. Francis Bumpus's forthcoming book, "London Churches: Ancient and Modern," which will be a history of London church architecture from the Conquest to the present day—from the solemn Romanesque chapel in the White Tower to Mr. Temple Moore's graceful church at Tooting. Mr. Bumpus's other book, "The Cathedrals and Churches of Northern Italy," is promised very shortly.

A Collection of paintings by the late Alfred Stevens forms part of the Salon exhibition of Brussels, which was opened on Tuesday.

Gallo-Roman remains have been discovered beneath a field at Varains, in the neighbourhood of Angers. Apparently they consist of a temple, arena and bath.

A Statue of Gustave Flaubert, the novelist, is to be erected in Rouen, of which city he was a native, and the Municipal Council have selected a site near the church of St. Laurent.

Remains of a Roman Villa, including a variety of tiles, have been unearthed in Enbourn Road, Newbury.

A Society has been formed, entitled "The Photographic Record and Survey of Sussex," for preserving records of antiquities, buildings of interest, passing events of local or historical importance, portraits of notable persons, old documents, rare books, prints, maps, scenery, &c., also subjects of interest connected with ethnography and anthropology, geology, Mediæval history, &c., which may tend to make the survey valuable and representative of the county of Sussex.

The Council of the Royal Institute of Architects of Ireland have agreed to write to the secretary of the unemployed committee of the Stonecutters' Union, with reference to communication received from the committee, regretting that any differences with regard to conditions of contract should interfere with the execution of building work, and to express a hope that any misunderstandings will be speedily removed.

A Bronze Urn about two feet high, which was found at Ovingdean, has been deposited in the Brighton Museum.

Papers will be read at the Institution of Civil Engineers on Tuesday on "The Pyrmont Bridge," and "The Swin Bridge over the River Avon at Bristol."

A Bill has been introduced in the New Jersey Legislature to make it unnecessary for architects to pay the annual fee, if required, under the License Act of 1902.

Arrangements are being made for the preservation of the castle at Canterbury, which is the third largest Norman keep in England, ranking next to those of Colchester and Norwich. In the reign of Edward II. it was converted into a prison, and for the last three-quarters of a century it has been used by the Canterbury Gas and Water Company as a place of storage for material and coals. The gas company is willing to sell the castle for 1,000*l.*, and the Mayor has accepted the offer on behalf of the city. The City Council has appointed a committee to act with the Mayor in the matter.

A Sub-Committee of the Lord Provost's committee of Edinburgh Town Council have agreed to recommend that a beginning should be made with the erection of the new buildings for the Municipal Art School in Lauriston. In view of the fact that the estimates are lower than was expected, the committee agreed, after conference with the architect, that some improvement should be made on the exterior of the building, and that additional fireproof flooring might be put in. The first section of the school will, it is understood, be completed by August of next year.

The Auld Brig Committee of Ayr Town Council on the 27th ult. agreed to proceed with the erection of a temporary bridge, to take the place of the Auld Brig while it is closed during the carrying out of the preservation works. The Auld Brig will not be closed for traffic till the temporary bridge has been constructed, but it is understood that it will be made a condition in the contract that the bridge is to be completed and ready for opening for traffic by the end of May. Till then, of course, operations cannot be begun by the engineers.

The Proposal to utilise Carnarvon Castle for the local Town Council meetings and for a museum has not received the approval of the Office of Works.

Sir A. Brumwell Thomas has issued a writ against the Belfast Corporation for the sum of 13,000*l.*, alleged to be due for fees in connection with the City Hall. The Corporation contend that not more than half that sum is due, and that it should not be paid until the building contract, about which there is a divergence of opinion with regard to extras, has been settled. A committee has been appointed to consider the subject.

The Fenton Education Committee have made the following arrangement with their architect:—"That Mr. Ashworth be paid a commission of 5 per cent. on new structural work and a commission of 3 per cent. on furniture and fittings; and that the commission of 2 per cent. previously charged by him to the builders for quantities be not charged in future, in accordance with the recommendation of the Local Government Board auditor."

JOHN BELCHER. A.R.A., Architect.

The Architect.

THE WEEK.

ES CLARKE HOOK, who died at his house at Churt Sunday in his eighty-eighth year, will be remembered one of the most characteristic of English painters. Twenty years ago he seemed destined to be one of the representatives of High Art as then interpreted. His wings from the Elgin Marbles were evidence. He won the gold medal of the Academy with a *Finding of the Body of Harold*, and a travelling studentship with *Isiah Watching the Dead Sons of Saul*. In the competition for the decoration of the Houses of Parliament he was represented by a *Satan in Paradise*. Venice he was captivated by colour, and to that city probably owe the English coast pieces on which his reputation will rest. It must not be supposed that his representations of scenes from Italian history and the Italian plays of SHAKESPEARE are commonplace. They deserve far more attention than they have received of late. But his second career gained RUSKIN'S favour, and in the fifties was sufficient. After 1854 historical and foreign subjects were abandoned with one or two exceptions, and his diploma work was *A Narrow Lane*. The last pictures he exhibited in 1902 were *Where the Green Sea Shingle* and *Home from the Marshes*. There is very little difference in the execution of them and earlier works of the same class. But there were changes in his style, and on that account Mr. Hook's recent paintings could not secure as much admiration as those which were discoveries, for, although he admired sailors and fishermen, he never made the principal elements of paintings. Mr. Hook's pictures are records of some varieties of English life, and are more historical in the true sense of the word than the scenes in which BAYARD, ISABELLA OF CASTILE, MOTHER OF MOSES, CHRISTIAN REFORMERS, BIANCA OF OTHO IV. and Lady JANE GREY appeared.

Johannesburg they have adopted an effectual measure to prevent the withdrawal of tenders, for such an act will involve a loss of 250*l.* The plans for the new University Buildings in Plein Square, by Mr. R. H. HEN, and the bills of quantities having been completed, tenders were invited for the 15th inst. A deposit of five guineas was necessary in order to obtain a tender, which was to be returned on receipt of a *bona fide* tender. It was also announced that a banked cheque for 250*l.* was to accompany each tender, and that it would not be recognised. The deposits were to be returned as soon as the contract and suretyship were signed. Sureties, to be approved by the Council, were also required to the extent of 10,000*l.* from the successful tenderer. Should any tenderer fail to sign the contract, including the necessary suretyship, when upon to do so, he will forfeit his deposit of 250*l.* and be liable to damages.

SCIENTIFIC congresses are an invention of the nineteenth century, and are derived from BREWSTER'S Association for the Advancement of Science. The institution owes its continuance in a large measure to the introduction of popular elements. But what is the value of a Mathematical Congress? The public are not having ability to comprehend symbols. First, they are daunted by them, for, as STUART MILL says, "they derive none of its certainty from its elements, but are as full of fictions as English law." Yet the International Congresses of Mathematics have been held, and a fourth is to meet in April 1908 in London. There will be four sections, viz.:—(1) Arithmetic, algebra, analysis; (2) geometry; (3) mechanics, mathematical physics, applied mathematics; (4) philo-

sophy, historical and didactic questions. The subscribers are to pay 25 francs, but families will be charged only 15 francs for each member. The secretary is Professor CASTELNOVO, 5 Piazza S. Pietro in Vincoli, Rome.

SECTION 102 of the London Building Act defines a "structure" as including "any building, wall, or other structure, and anything affixed to or projecting from any building, wall, or other structure." But that definition is found in Part IX., which relates to dangerous and neglected structures, and it remains doubtful whether it is generally applicable. Mr. DENMAN, the magistrate, recently considered that a sort of show or advertisement case, 13 feet high and projecting 3 feet, which was temporarily affixed to the Palace Theatre, was a building or structure within the meaning of the Act, and the owners were liable to be fined for going beyond the building line. They appealed, and the case was heard in the King's Bench Division. The appellants relied on the fact that the advertisement case was merely hung on the wall by means of bolts, and therefore was not a structure. The magistrate, in his affidavit, said no question of law was raised before him, and he decided on the facts. Their Lordships considered the question was one of fact, and the magistrate's decision was upheld. The result is disappointing, but it is unlikely a more definite solution will be discovered.

ALTHOUGH Sir WALTER SCOTT occupied a part of a lofty house in Edinburgh and was opposed to change, yet he was not indifferent to the evils of the flat system. According to him, "each inhabitable space was crowded like the underdeck of a ship. Sickness had no nook or quiet, affliction no retreat for solitary indulgence." Another result was that owing to the restriction of the flats the occupants were compelled to transact business in taverns. The lofty houses are still characteristic of Edinburgh and are not likely to be superseded for many years. But in suburban districts which are increasing yearly in popularity, the English rather than the Scottish type of house is now adopted. Some are laid out for a single family, others for two families, but unusual populousness is not contemplated. The statistics of the Edinburgh Dean of Guild Court are suggestive of the change which affects manners and health as well as construction. In 1900 the plans for self-contained houses which were approved numbered 121, in 1906 the number had increased to 399. Tenement houses declined from 82 to 65 for the same year. SCOTT feared that a "house within itself" made an owner indifferent to neighbours, while in a tenement neighbours were compelled to live in kindness and harmony, but that is a subject which builders cannot be expected to take into account.

THE directors of the Institut Pasteur in Paris, when they heard of the unanticipated good fortune by which they are the heirs of the late M. OSIRIS, lost no time in consulting their architect and adopting his recommendations. The buildings are quite modern, but many aids to hospital practice have been devised of late years, and it was considered that the Institut Pasteur, which represents a revolution, should be as near perfection as possible. Both the officials and the patients will have reason to bless M. OSIRIS, although he may have intended to apply the greater part of the fortune he possessed to other uses. If any development of the system which M. PASTEUR introduced is possible, it will no longer be necessary to delay the accepting of it through want of funds. The example of the directors is worthy of attention by hospital authorities in all lands. The influence of a building on the recovery of patients is not sufficiently accepted, for not even Pasteurism can succeed amidst defective surroundings.

VALUE FOR MONEY.

WE spoke last week of value for money as being one of the vital considerations that an architect has to take into account in making choice of material. An important department of building construction in which this consideration is perhaps not always sufficiently recognised is that of fireproof, or, as it is now more correctly the fashion to term it, fire-resisting construction.

It is too frequently the practice amongst architects who contemplate the introduction of fire-resisting construction into their buildings to put a number of firms in competition, giving them the barest outline of what is required and making the selection of the fortunate recipient of the contract purely on the basis of price. A fire-resisting floor we will suppose is required to cover a space of certain fixed dimensions. Each competitor is left free to propose the particular system in which he specialises, possibly even to determine the presumed safe load that his floor is supposed to be capable of carrying, though this particular requirement is not infrequently fixed by the architect when sending out his invitations for tenders. The offers of the various firms are received by the architect and the prices range, we will say, between 6s. 10d. and 7s. 6d. per yard. More often than not the tender at 6s. 10d. is accepted without any further examination or analysis, but has the architect by so doing made sure that he is obtaining for his client the best value for money?

First, as fire-resistance is presumably one of the main objects for the intended existence of the floor, are the one at 6s. 10d. and the one at 7s. 6d. equal in this respect? Have they both been subjected to test by some impartial and competent authority? If so comparison should be made not only of the results of the tests but of the conditions of each. The amount of resistance actually desired for the floor in its intended application, as well as the conditions under which it will possibly be called upon for that resistance, must be also compared with those of the tests. To make these comparisons fairly and justly the architect must know how varying conditions affect fire-resisting construction—such as the effect of load on a heated floor, differing according as the load is a greater or less proportion of the ultimate breaking stress; the effect of span, of the impact of flame, of the varying or equable distribution of heat. It is from disregard of these conditions that there results the utter futility of the testimony of actual experience in fires so much vaunted by some makers of "fireproof" floors, partitions and safes. Many a safe has "preserved uninjured its valuable contents, &c." in a conflagration simply because it has happened to experience scarcely enough heat to scorch the paint, whilst if it had been exposed to what the Germans call a *schicht-flamme*, "its valuable contents" would have been reduced to tinder.

Because a floor or partition has stood unharmed in a building damaged by fire, it does not follow that it will be equally fortunate on the next occasion. It is one of the characteristics of actual conflagrations, as distinguished from careful tests by competent experts, that in the former actualities and heat move in swirls, eddies and strata, alternated with comparatively cool currents of air, so that in the same burning building, and even in the same room, there may be a difference of 1,000 deg. Fahr. or more. Hence the inconclusive value of the evidence of actual experience in fires as proof of the ability of any special form of construction to furnish adequate fire-resistance. Failing tests by competent and impartial authorities, the architect must use his own judgment in estimating for himself the fire-resistance of the construction proposed, and in doing so must accept the responsibility of a right or wrong conclusion. Relative ability in fire-resistance does not

terminate the investigation of the architect who would obtain for his client the best value for money.

The next point, perhaps, is the probable condition of the 6s. 10d. and the 7s. 6d. floors after exposure to fire and water. There are in the present Building Trades Exhibition, for instance, some forms of fire-resisting floors which after a conflagration would need no more than a coat of plaster to render them still serviceable and sightly, whilst others, although capable of fire-resistance, would need entire reconstruction before the building could be regarded as once again reasonably safe and useable.

Then there must be taken into account the attitude of the insurance companies. A lower rate of premium which may be negotiable with a higher-priced floor may turn the scale of relative value. The respective weight-carrying potentialities of the floors under consideration should receive careful investigation. A low-priced floor whose safe load is $2\frac{1}{2}$ cwt. per foot may be a much dearer article than one for which the calculations have been based on a working load of 3 cwt. per foot.

As we have noted above, it is not an unusual practice for architects to specify the load which the floor that is the subject of tender must be capable of carrying. But if you do this you must, to use the hackneyed expression, "see that you get it." The sizes of joists and girders suggested by the contractor must be checked for their weight-carrying capacity. Not merely must the sections be of the right size, but the quality of the metal to be supplied must bear investigation and test. Our best English ironmasters, for instance, are in the habit of supplying mild steel joists with an ultimate fibre breaking stress of 30 tons per square inch, but stuff which comes from Belgium is usually very much below this figure. Some architects of a rather mechanical and mathematical turn of mind than others, their colleagues make a practice of sending drawings to engineers with the exact sizes and weights of joists, carefully determined and figured, but this may always result in obtaining for their client the best value for money. The sizes specified may not be those which the engineer in question has in stock or which he may be able to purchase at the lowest price, whilst if the settlement of the actual scantlings were left to him he might be able to supply something equally effective at a lower cost to the client, and possibly at the same time with a better profit to himself. It seems therefore advisable as a matter of business to allow the engineer who is to supply the goods to select the exact section which should afterwards be examined and criticised by the architect. When this method, however, is followed it is more than ever important to test the quality of the material, for it is obvious that the opportunities which will be grasped by an iron merchant for buying joists at low prices are often the result of the "dumping" of surplus products of continental manufacturers, and probably of low grade.

Another point that must be carefully examined by the architect is the effect of the various proposals by contractors tendering for fire-resisting floors on the elements of his building. A low-priced floor may be cheap if by its disposition of girders and their load it increases the support required from his walls, necessitating perhaps extra piers with expensive temporary or even stanchions. A thin floor at a higher price may be cheaper in the long run than one of greater thickness that results in an increased height of walls in order to maintain the internal cubical extent desired. Then again, the amount of attendance upon the engineer and contractor required from the builder, and the relative extent of cutting away, scaffolding and centring during the interference these occasion with the remainder of the buildingwork and other trades, are all matters that require investigation and are factors that influence the ultimate cost of the building and make all the difference between an economical and an expensive floor.

A point that is very often overlooked by architects is the great effect in lessening the necessary sizes

orders resulting from the introduction of intermediate supports. Our engineers of to-day can supply us with orders capable of bridging enormous spans, but it is questionable whether in many cases the use of such orders would give the best value for money.

It is very nice to be able to span, say, a hospital and 28 feet wide without any intermediate supports, but would the efficiency or the healthiness of such a span be sensibly diminished by a single column or anchion under a girder, and would not the saving of something like two-thirds of the weight of the girder result in better value for money? We thus see that even such a comparatively simple matter as the selection or acceptance of a tender for a fire-resisting floor is one that entails considerable thought and skill on the part of an architect who conscientiously endeavours to obtain for his client the best value for money.

PUBLIC WORKS IN EGYPT.

THE report on the finances, administration and condition of Egypt and the Soudan in 1906 has peculiar interest, for it is an explanation, if not a defence, of Lord CROMER's policy as the representative of Great Britain during a quarter of a century. So long a period of anxiety could not fail to be exhausting, and Lordship has to acknowledge he is "worn out," and in consequence has resigned the office of "His Majesty's Agent and Consul-General." The report is a remarkable document, and almost unique in character. Roman governors may have held positions as difficult, but they have left no record, for the renowned "Commentaries" of CÆSAR are devoted to battles and sieges.

There is a temptation in Egypt for an authority to set up costly memorials of its power. When BONAPARTE told his soldiers that forty centuries looked down on them from the Pyramids, he was shrewdly turning local conditions to his own account. As conquerors the troops would so be remembered. Egypt possesses colossal examples of architecture which were inspired by vanity, reverence or fear, but which are of little use to the modern inhabitants. Indeed, Egyptian structures, although they excite wonder, have made people imagine that the best architecture is without utility. If our French friends could attain their ambition and exercise control in Egypt there is no doubt they would make an effort to imitate the PHARAOHS and erect triumphal arches, columns and other works simply for the astonishment of posterity.

The memorials of Lord CROMER's rule are of a different class. They were not suggested by examples from the dynasties. The Assouan reservoir may not be so impressive as the pyramids or the temples, but so long as the physical conditions of Egypt remain as they are at present it will confer benefits on multitudes, unlike the earlier works, which could never serve at any time. Its importance has been demonstrated by experience. To increase the river supply the stored water had to be used after May 1906. The daily amount varied from 6,000,000 to 20,000,000 cubic metres. With such a variation it is no wonder "the regulation of the dam sluices is a most intricate piece of work," for the state of the river has to be studied to avoid excess or insufficiency of supply, but the resident engineers have reduced the regulation to a science. The belief in the stability of the dam is also confirmed. It suggests the character of the natives and the difficulty of providing for them, when we learn that they showed curious disregard of existing laws and regulations in using the water. The conversion or reclamation of lands in Middle Egypt are likely to cost between four and five millions sterling. The value of the land consequently is increased to an enormous extent, and the Government has had to purchase any areas required not at their present but at their prospective value. Another great dam is in course of construction at Esneh by Messrs. AIRD.

Railways have been constructed which carried last

year over twenty-two millions of passengers and nearly seven millions of tons of goods. There are also light railways, and Lord CROMER remarks that the number of school children using them is rapidly increasing. In 1906 the total expenditure on Cairo was 249,680E£, while in 1905 the amount was 158,585E£. All the inhabitants of Cairo have to pay towards the improvements of the city in direct taxation is only about 8 per cent. on their rental value. It is no wonder that wealth has greatly increased of late years under such economical conditions. An important work is the improvement of the port of Alexandria. The proportion of berthing is 1 metre to 604 tons of goods. It has been ascertained that the proportion of berthing to tonnage was, at Trieste, 1 metre to 281 tons; at Hamburg, 1 metre to 368 tons; at Marseilles, 1 metre to 380 tons; at Havre, 1 metre to 233 tons; at Liverpool, 1 metre to 274 tons; at Manchester, 1 metre to 402 tons; and at Glasgow, 1 metre to 581 tons. At Antwerp the proportion is 1 metre to 719 tons, and hence 45,000 metres of quay room must be added along the Scheldt to meet the necessities of commerce.

A large bridge is in course of construction at Rodah. Part of the work was executed by local labour, but some of the rivetting had to be done twice over owing to the demand for rivetters on other works in Egypt. Messrs. ARROL, the contractors, had to train not only their own men but also men for other works. It was a hardship for them but an advantage for Egypt. Here it may be mentioned that at Halfa, in the Soudan, natives were obtained who could rivet, but of their ability Captain MORANT writes:—"Under certain conditions five natives will knock in 500 half-inch rivets in the day, whereas in England the same amount of work would be done by two men and a boy. But, whilst the total pay of both gangs would be approximately the same, the rivetting here is much less efficiently done." It is, however, a sign of progress when we find that rivetting is possible in so remote a place at even double the expense of English work. Another sign of progress is to be found by the demand from many parts of Egypt for hospitals, schools, post offices, police barracks, &c.

The Public Works Department expended last year 2,422,000E£. It is considered a wise policy to employ as many natives as possible, and last year 540 Egyptians were employed to 99 Europeans, but it is difficult to obtain Egyptians who have sufficient technical knowledge for such posts. There has had to be a slight increase in the English staff, and the result was a proportionate increase in efficiency. In the Survey Department there is a staff of 28 Europeans and 42 Egyptians, but the temporary employés, numbering 600, are all Egyptians. Surveying was in demand among the ancient Egyptians, and their descendants ought to inherit some aptitude for it. Captain LYONS explains his position by saying:—"It should be remembered that I have been required to produce a survey up to European standards at a more rapid rate than any European survey, so it has been impossible to do more than teach each man his piece of work. Now that pressure is relaxed I am training on more general lines those that are promising, and these will go to fill higher posts." There is no question that natives who are careful can find many opportunities for advancement under English administration. Indeed, the success is often enough to fill Englishmen with envy. Lord CROMER in a feeling way alludes to the difference. While Egyptians are gaining wealth the modest incomes of English officials have remained stationary, and the cost of living has increased in every direction. His Lordship points out that it is their duty to resist the temptation to speculation, either in land or in other directions, as practised by native officials.

It cannot be said that his efforts to promote the prosperity of Egypt have made Lord CROMER forgetful of antiquity. The repairs to temples are continued. All the columns at Karnak which fell in 1899 have been

re-erected. The next work to be undertaken will be the restoration of the fallen pylon at the west end of the great hall. The repairs to the temple at Edfou have been completed. Excavations are in progress at Sak-kara. Fragments of a manuscript play of MENANDER and a collection of exquisite silverwork have been found. Of the twenty statuettes stolen from the Cairo Museum only six have been recovered. The Arab monuments are not neglected, and a sum of 11,000*£*. has been expended on the Sultan Hassan Mosque.

A problem of a different kind is offered in the Soudan, which in area is twice as big as France and Germany combined. Out of the 950,000 square miles only about 1,576 were cultivated. During 1905 and 1906 no less than 303,770 were brought under culture, owing mainly to the heavy rains. But even the most advanced part of the Soudan can scarcely be said to have emerged from barbarism. There are enemies within and without, but progress is extending, especially if, as elsewhere, the test of taxation is applied. In 1903 the gross revenue was 24,416*£*., in 1906 the amount was increased to 235,669*£*..

During the year 1,600 miles of road were cleared. They are of a simple kind, for there is no metalling, and the watercourses are rarely bridged. There are over 1,000 miles of railway in the Soudan. The post office and telegraphs are developing, and it is suggestive of the desire to aid the people that quinine is now kept on sale at all the post offices in those districts of the Soudan which are most liable to fever. The most expensive works at present in hand are at Port Soudan, where, in addition to the usual accessories of a harbour, barracks, post offices, quarters for officials, schools, &c., are in progress.

In the report much is said about the treatment of British manufacturers in respect of the Soudan works. Captain KENNEDY, who is in charge, says that all reasonable preference should be given to the British manufacturer, but he is not in touch with local requirements like his continental rivals. The British representatives are generally mere selling agents, while continental firms employ both business men and technical men. Captain KENNEDY said he lately applied for quotations for steel towers for the storage of water for a town supply. He received two British quotations. One showed an antiquated tower evidently taken from an old catalogue, and quite unsuited; the other was a design which was structurally faulty, and could not be accepted. Some Belgian firms having agents in Egypt sent designs which were up-to-date in all respects, and suited to the requirements.

On another occasion Captain KENNEDY wanted to arrange several contracts for structural steelwork, laying water mains, &c. One British firm was represented by an agent who was without authority to state prices or to furnish details. Another British firm was represented by an engineer whose knowledge was insufficient to enable him to tender. The representative of a German firm was a first-rate engineer, and without any consultation with headquarters in Germany he furnished a complete tender, specification and full technical details and calculations. A Belgian firm sent a business agent and their chief engineer. In a few days satisfactory plans, specifications and tenders were produced by them. Captain KENNEDY says he pointed out to a British agent that his price for carrying out certain work was inaccurate. Although he represented the engineering and business sides of the undertaking, the agent had to refer to the firm at home; a reply was received stating that the price given was correct, although it was based on home practice and not on the condition of the Soudan. Captain KENNEDY declares emphatically that the higher class of continental firms trading in Egypt are better represented than their English rivals, and it is no wonder if a great deal of trade is snapped up by continental competitors. He testifies that the machinery and plant from England have been excellent, and the British Portland cement is

of such a high standard that no further supplies natural or artificial cement are obtained from Belgium although their prices are considerably lower. He regrets to say that building stores generally sent from England are of an inferior character. Material which would not be used at home is supposed to be good enough for export. The result is that many "repeat orders" are not repeated owing to bad materials having been received in the first instance. A considerable quantity of structural steelwork has been received from Belgium, and was found to be satisfactory in quality and workmanship. "It is a pity to happen to know," says Captain KENNEDY, "that some of the orders placed by me in England were sub-contracted for in Belgium and shipped direct from Belgium to the Soudan." American plant, although excellent in design, has been found to be of inferior quality structurally. Well-boring plant and steam road-rollers were examples. It has been deemed advisable to obtain detailed designs from America, and have them carried out in England. It is also mentioned that the German firms are more disposed to give credit to native traders in the Soudan than the British. The Germans, from their more exact knowledge of the people, know the extent of the risk, and it is feared that in consequence those competitors will gain so tight a hold on the import trade that it will be difficult for British merchants to shake them off.

Archæology is not neglected in the Soudan although funds are limited. The temple at Wady Halfa is enclosed and roofed. The temple of Kumma is clear of occupants. The few columns remaining of the temple near Gebel Barkel are saved by timely repairs. Arrangements are made for the temporary protection of the church at Old Dongola, which is closely connected with the Mediæval history of Nubia. During the past year several Christian antiquities were discovered. It is also stated that a series of old Nubian papyri, partly in Meroitic and partly in other characters, are in the hands of Berlin savants. In archæology as well as in commercial affairs it appears to be necessary to invoke German aid. Their conclusions are expected to throw light on inscriptions in the Soudan which hitherto have been undecipherable.

It is doubtful whether any other official documents receive so much attention as Lord CROMER's reports. No less than 11,500 copies of the report for 1905 were printed. The desire for information is partly owing to the interest of the subject, but much is due to the way in which the details are treated. The reports are characteristically British. There is no attempt to conceal weak points by fine writing; facts are stated, and the methods proposed for dealing with them are described as definitely as is possible. The series of reports on Egypt must therefore be considered as State papers which are deserving of imitation by those who hold high office as representatives of Great Britain.

DANISH PICTURES.

"DENMARK'S a prison," and "one o' the worst," says HAMLET. The words are not inapplicable to the peculiar restraint which seems to be imposed on Danish painters, or is accepted by them. The impression which the collection of works now to be seen in the Art Gallery of the Corporation of London is likely to make on visitors who are accustomed to seeing pictures, is not unlike that which a French audience endures on seeing a performance of "Hamlet." There are a few scenes which have colour and action, but the tragedy seems to be entirely enveloped in "the trappings and the suits of woe." The Danish pictures are more suggestive of a country where fogs prevail and brilliant colour is unknown, than the majority of those which are produced in London, which is supposed to be notorious for its fogs. Black is a dominant colour in the Guildhall Gallery.

The painting called *The Asiatic Company in Copenhagen*, by WILHELM HAMMERSHØI, which is a view of a building in black, tempered with a little indigo, should have been given the first place in the gallery and the catalogue, for it would serve as a key to the collection. Architectural paintings are often doleful, but this example is a nightmare. The building is as good an example of Classic as the majority of those we have in London, and the details are honestly rendered, but the influence of local colour has made of it an embodiment of dreariness. We doubt if in reality the building was as black as it is painted. The picture that comes next is not quite as black, for it is an *Adam and Eve*, by JULIUS PAULSEN, but it is more oppressive. The first man is supposed to be awakening from slumber and gazing on the first woman, who is standing before him. The local fogs must in some way have mingled themselves with the flesh tints as well as with the green used for the grass. The shadowing of the figures is almost black. One cannot help wishing that a smart shower of rain descended to wash both the figures and the grass. EVE is moreover, rather weighty, for she has sunk to such an extent in the turf that we cannot see her toes. Probably the artist wished to suggest that she had ascended from the earth and was not quite free. We should like to know the opinion of the Smoke Abatement Society about M. NIELS LUND's *A View of London Looking from the West Tower of the Royal Exchange: Time, the Accession of the King Edward VII.* On such an occasion an ultra-realist would allow that a little sunshine and brilliancy of colour would not be out of place, and if we remember rightly the day was rather bright; but Mr. LUND, as a Dane, does not believe in brightness. He takes remarkable pains in representing the buildings, but we doubt if any Londoner would recognise such general gloom as a characteristic of the centre of the City.

Indeed, it is only when artificial light is introduced that the Danish artist is tempted to present colour and light as well as shade. ERIK HENNINGSEN's *Evening in Street, Petergade, Copenhagen*, is a welcome novelty, for we can see the colour of dresses and life abounds. The snow on the ground approaches white and we are gratified to learn that white is tolerated for pastry-cooks' aprons. Another work which is in the upper gallery, and which many consider to be the best picture in the collection, is *The Committee of French Artists for the Exhibition in Copenhagen in 1888*, by P. S. KRÖYER. The illumination is supposed to come from a lamp on a table, where a plan of the building is under discussion by M. BONNAT and the late PUVIS DE CHAVANNES, while MM. GERÔME, J. P. LAURENS and others are listening. On such an occasion an architect was likely to take principal part, but painters have a peculiar equity, and the late CHARLES GARNIER is placed at the most remote point and appears to be craning his head to get a glimpse of the plan. Like many another painting, its use as a record is of no account, but because of the lamp-light and the absence of atmosphere we must recognise that M. KRÖYER can paint heads in excellent style.

The more we know of waves the more difficult they are to paint. Danish artists should be able to show them under new aspects. Professor TUXEN's *Appassionata* is one of the modern attempts to depict a single wave. The crest in the centre is curled into countless whorls, and evidently is an exact representation of a curl. But the point of view is above the water, and it is only when lying on the shore that one can fully judge of the commotion, which is owing to several causes, some of them being unknown, which act along the line of the wave as well as behind it. *The Wake of the Ship, Mediterranean*, by THORWOLD NISS, recalls the late HENRY MOORE's seascapes. The painter has aside inherited notions and has painted the Mediterranean as it appears to most travellers. ANTON LILJE's *Sea Piece* is also worth notice, for we seem

to have the prelude of a storm in which water and sky combine for effect. *The Vikings*, by THOROLF PEDERSEN, has many of the qualities for popularity. The vessel might be described in MILTON's words as "built in the eclipse and rigged with curses dark," for the baleful form of the ship, its immense sail and the armed rowers express the general idea of the sea-rovers when they approached a coast where there was plunder. *The Winter Evening in a Danish Bay*, by WILHELM KYHN, is a more desolate scene than is ever presented in England or Scotland, and the absence of animation increases the effect, but the red light in the sky and the expanse of snow, of which the monotony is broken by an occasional black post, form a contrast with other pictures. *Cape North, Iceland*, by C. BLACHE, belongs to the Corporation of Nottingham. The grey land and the green waves are a pleasing contrast. LAURITZ HOLST's *White Gale* shows some great waves, but we wonder that CARL RASMUSSEN's *A Whaler Leaving Greenland in a Dispersing Sea Fog* was ever allowed to go from Denmark, for it has qualities which would be more appreciated by natives than by foreigners. Taken as a whole, the Danish painters do not appear to have taken advantage of their opportunities. There is not one work which suggests the tumultuousness of the sea, such as we see it in TURNER's pictures. It is only by liberal interpretation that we could imagine the Danish waves swallowing a large vessel as if it were a pebble. But this may arise from the absence of any fear of the ocean. The people have been so familiar with its moods during many generations, they may now look on all the phenomena as commonplace.

OTTO BACHÉ's *The Conspirators Riding from Finnerup after the Murder of King Eric Glipping* is the biggest picture in the collection, for it measures 99 inches by 148 inches. The group of equestrians are in the foreground, and as the event took place in the evening and they are disguised as monks they appear as a dark mass, in which individuality is confounded. In the background are the buildings which they have fired. The old legends do not appear to be much utilised by Danish painters. *The Death of Childe Olaf* is curious from its arrangement, for, like a scene on the stage, we see the interior of a cabin and a part of the deck with another boat outside. *Venus Triumphant*, by Professor L. TUXEN, resembles a copy of a French ceiling painting; works of the kind are outside the province of the northern artists. Far preferable is *A Sardinière, Finisterre*, by P. S. KRÖYER, in which apathetic women are seen engaged in dressing the myriads of silver fish as if it were the most joyless of tasks. *A Pierrot and His Family*, by W. ROSENSTRAND, is a favourite subject with painters of all countries. Here the man is seen rocking a cradle while studying a part, and his wife is engaged in dressing. It must have been painted outside Denmark, for otherwise there would be less colour. In *The Churchyard*, by HANS HANSEN, we see a lonely peasant woman contemplating graves. In *Summer Evening at the Skaw*, by P. S. KRÖYER, the artist has had the courage to represent a man and woman in light summer clothes admiring the moonlight on the water.

There are a few religious paintings in the collection. *Christ and the Pharisees*, by AXEL HELSTED, is suggestive of a scene in modern Jerusalem, while the *Ecce Agnus Dei*, by the Baron ARILD ROSENKRANTZ, differs from the ordinary paintings inspired by the words, for it depicts the Entombment, and it is reverential and pathetic. *The Christian Martyr in the Roman Arena* is merely a nude figure against a wall. It is by V. IRMINGER, whose *Wounded Lioness in the Roman Arena* might be a copy in oils of the Assyrian relief in the British Museum, which received so much attention from French artists after 1870, as if it were adapted to serve as a monument of the last war.

The two paintings by Professor TUXEN, *The Anointing of Queen Alexandra at the Coronation of*

King Edward VII. and The Coronation of His Majesty the Czar Nicholas II. of Russia, are remarkable as contrasts with the other paintings. They are most brilliant: the Russian scene is the more crowded, and the uniforms, stars, gilded railings seem to demand the immense diamond crown which the Czar wears as a necessity. Without that object the picture would seem to be imperfect and deprived of a central point. Apart from the colours the subjects are unlike those of the other pictures, which are mainly records of humble life. There is a ghastly scene, *The Death of Queen Sophia Amelia*, by CHRISTIAN ZAARTMANN, an old lady wearing all her finery. Another work by the same artist, *Charlotte Biehl, the Writer of Scandals*, represents a usual accompaniment of a court, who is seen peering behind a curtain with a quill pen in her mouth, as if in order to leave no time for reflection before writing.

There is a fine view of *The Interior of Ribe Cathedral*, by JORGEN ROED. The building dates from 1117, and the treatment resembles our Norman. There are views of some other Danish buildings, but the castle designed by INIGO JONES, which would have been especially interesting to Englishmen, is not to be seen among them. Foreign buildings appear more in favour with the artists. There is a view of *The Erechtheion at the Acropolis*, by JOAKIM SKOVGAARD, which, if pictures could speak, would have much to say about the influence of pure air, which can bring out all the details of a figure or a landscape, upon the artistic temperament. The Athenians believed that the air of the neighbouring Boeotia caused the people to differ from themselves, and it is to be feared that Denmark has an atmosphere which is an obstacle to the perfecting of art. Yet when we see such a work as *The Fallen Tree*, by THORWOLD NISS, which might have been inspired by one of MILLAIS'S late landscapes, owing to the elaboration of the foreground, one is disposed to doubt whether many of the peculiarities of Danish painting are not derived partly from a traditional method of treatment and partly from the influence of some French painters who had a fear of all but very dull colours.

London is the recognised capital of the world, and the Corporation are therefore bound to exercise their hospitality towards many schools. It is well to have contrasts, and, as a balance to the Danish system, the committee would be wise to exemplify next year a school in which colour is predominant. Hitherto the art of the Austrian, Hungarian and allied races has not been represented, and there could be no better time for the display than next year. It cannot be said that much is to be gained either by the ordinary sightseer or the student of art from the present exhibition beyond admiration for artists who seem to be struggling amidst difficulties imposed by nature. It is now generally admitted that colour is the first quality in painting, and if we see little of it this year in the Guildhall galleries, the law of compensation will compel us to expect an abundance of it at another time, and there is no richer source than among the artists who are officially described as belonging to the Austrian school, although to the best men among the painters that designation is not acceptable.

UNIVERSITY COLLEGE, LONDON.

THE accommodation provided at University of London, University College, for the schools of engineering and of architecture will be considerably extended before the beginning of the next session in October by the additional space which becomes available through the removal of University College school to Hampstead. Full courses for University of London degrees in engineering and in architecture are given at University College and occupy three years. Students intending to enter the college in October should pass the matriculation examination in June or in September. The Andrews scholarships are offered for competition in May next; one of these scholarships, value 30*l.*, in science and mathematics is tenable in the school of engineering. Full particulars of the courses and of the scholarships can be obtained on application to the secretary.

SHEFFIELD SOCIETY OF ARCHITECTS.

THE annual general meeting was held on the 11th. Mr. E. Holmes presided. Mr. T. H. Robinson elected an associate member.

The hon. treasurer's statement of accounts and report of the Council were read. These showed that financial position of the Society was satisfactory, and there had been a slight increase in the membership. report drew attention to numerous matters of interest to members of the profession, amongst which may be mentioned the Model Cottage Exhibition to be held this year at High Wincobank, and the laying out of Fitzalan Square scheme for the architectural treatment of which was proposed by the Council of the Society and for which the Council had expressed its thanks.

Mr. J. R. Truelove was awarded the prize of 5*l.* 5*s.* for the best measured drawings, subject to the usual conditions.

The ballot for officers resulted as follows:—President, Mr. W. C. Fenton; vice-president, Mr. W. J. H. Fowler; hon. treasurer, Mr. F. Fowler; hon. secretary, Mr. J. W. Wigfull; Council, Messrs. C. B. Flockton, C. Gibson, Mitchell-Withers, H. L. Paterson, A. E. Turnell, A. Watson, W. G. Buck, C. F. Innocent and H. J. Potter.

At the conclusion of the business meeting Mr. A. W. S. Cross and G. Hubbard, of London, read papers dealing with "The Revision of the Charter of the Royal Institute of British Architects." Their address threw much light upon the proposals of the Institute, which may have far-reaching effects on the profession in the future. The papers were followed by a discussion in which the feeling was expressed that these proposals, the result of compromise, left the main subject—i.e. compulsory registration of architects—much in the same position before, and that the supporters of this measure should relax their efforts until their object was attained.

MR. H. GOODYEAR.

THE Royal Academy of Fine Arts of Milan have recently elected Mr. William H. Goodyear, of the Brooklyn Museum, to honorary membership. The reason for this distinction is found in contributions to Mediaeval architectural research in Italy which have been made by the Brooklyn Museum through Mr. Goodyear's activity. There are many Brooklynites appreciative of the admirable manner in which Mr. Goodyear has arranged for exhibiting the art treasures of the Museum and fulfilled the duties of his office, who will be much interested in a specific relation of the value and extent of his research.

Mr. Goodyear is now sixty-one years of age, having been born in New Haven, Conn., in 1846. He was the youngest son of Charles Goodyear, who discovered the process for vulcanising india-rubber. Six years of his boyhood were passed in England and France, whither his father had taken his family to introduce his invention into the india-rubber industry. Subsequently the boy was prepared for college at Dr. Russell's school in New Haven and was graduated from Yale College in 1867. In that year he went to Germany to study Roman law in the universities of Berlin and Heidelberg, but soon transferred his interest and his German university studies to general history, as illustrated and related to the monuments of historic art. The study of the history of art as a part of the general history of civilisation was first developed in Germany, and in 1870 this study was scarcely known at all in England or the United States.

Thus, on his return in 1870, Mr. Goodyear became one of the earliest pioneers in introducing the study of the history of art into the United States, and was thus prepared to fill the position of curator of fine arts, which he originally held in the Metropolitan Museum of New York between 1881 and 1888, and which he has held in Brooklyn since 1899.

One of his books on the history of art was published in 1888, especially as a text-book for schools and colleges, and is now in its seventeenth edition. Two other popular books of similar character were prepared for the Chautauque Reading Circle, and were subsequently purchased by the American branch of the Macmillan Publishing Company. Mr. Goodyear is also the author of a work of research on the origin and subsequent diffusion of Greek architectural pattern ornament.

This work, published in 1891, is entitled "Grammar of the Lotus." It is a royal quarto of 400 pages, and more than 1,100 illustrations. It was published in London by English support and assistance which was provided by the efforts

the Egyptologist, Miss Amelia B. Edwards, who made Mr. Goodyear's acquaintance during her lecture tour in this country, and became a staunch supporter of his researches. The thesis of the "Grammar of the Lotus" is that the Greek pattern ornament is almost wholly derived from Egyptian lotus ornaments. This thesis was developed from demonstration, based upon Cypriote pottery lotuses in the Metropolitan Museum, that the apparently schematic volutes of the Greek Ionic capital are derived from curling lotus petals.

In recent years, aside from his constant activity in the everyday routine of a museum curator, Mr. Goodyear has come widely known for his researches in Mediaeval architecture, which have been made in the interest of the Brooklyn Museum, where the results of those researches are to be seen in the shape of numerous large and splendid original photographs. For these researches not only has he received honorary distinction from the Royal Academy of Fine Arts in Milan, but he had previously received a similar distinction from the Society of Architects of Rome and of Edinburgh.

It is of peculiar interest to mention that the Roman Society has only six honorary members, and that Mr. Goodyear is the only English-speaking member. Among the remaining five members may be mentioned the Marquis de Vogué, the famous explorer of Northern Syria, Rohault Fleury (recently deceased), a celebrated French Mediaevalist, and Paul Wallot, architect of the Parliament House in Berlin.

ITALIAN GARDENS.

A PAPER on "The Art of Garden Design in Italy" was read by Mr. H. Inigo Triggs at a meeting of the Manchester Society of Architects. Mr. Isaac Taylor presided. Mr. Triggs pointed out that for centuries the architect was the designer of the big gardens, and not the gardener. It is only, he said, within the last three-quarters of a century so that the gardeners had taken to garden designing and ousted the architect. This, in the lecturer's opinion, is rather to be regretted, for the garden should be in harmony with the design of the house to which it was attached. Italian gardens were designed by men of eminence in the architect's profession. These men knew the value of an enchanting prospect. The Italians meant by gardens something quite different from what English people meant by them. The cultivation of flowers and trees was the primary object with us; with them the garden was an open-air continuation of the house itself, quite independent of floriculture. All the same, as all foreigners admitted, English gardens were the finest gardens in the world. For the thing the Italians could not produce a grassy lawn. Mr. Triggs deprecated any attempt to combine the Italian and the English styles of gardens. He had also a word to say in praise of the Italian habit of keeping to one kind of effect or shade, and in dispraise of the Englishman's desire for "a variety of foliage" obtained by planting all sorts of trees near to one another.

PRIZES FOR ART STUDENTS.

THE Council of the Society of Arts are prepared to offer, under the terms of the Mulready Trust, a gold medal or a prize of 20*l.* for competition amongst students of the schools of art of the United Kingdom at the annual competition to be held in 1908.

The prize is offered to the student who obtains the highest awards in the following subjects:—(a) A finished drawing of imperial size from the nude living model; (b) a set of time studies on a small scale from the nude living model, executed in a short time, of varied shortly sustained poses (mounted on not more than two imperial size mounts); (c) a set of studies of hands and feet from the living model (mounted on not more than two imperial size mounts); (d) drawing from the life, including memory drawing done at the exhibition in May 1908.

No student will be eligible for the award who does not pass in the examination (d) in drawing from the life, and who does not obtain an award for (a) the finished drawing of imperial size from the nude living model. The other subjects are optional. The works must have been executed between April 1, 1907, and March 31, 1908.

The recipient of a prize awarded under this trust in 1892, 1893, 1896 or 1903 cannot compete again.

The drawings, &c., are to be submitted, with other school works, in the usual manner to the Board of Education, South

Kensington, in April 1908. Each competing drawing must be marked "In competition for the Mulready Prize," in addition to being labelled according to the regulations of the Board of Education.

The Council of the Society of Arts are also prepared to offer, under the terms of the Stock Trust, a gold medal or a prize of 20*l.* for competition amongst the students of the schools of art of the United Kingdom, at the annual competition to be held in 1908.

The prize is offered for the best original designs for an architectural decoration, to be carried out in painting, stucco, carving, mosaic or any other process.

This architectural decoration is to be for the side of a room or a hall, a ceiling, the apse or side of the chancel of a church or any suitable part of the interior of a building.

The designs must be on imperial sheets. Each set must consist at least of a coloured drawing to scale of the whole design of decoration, and two coloured drawings of details on separate imperial sheets. Mere patterns or sketches of details, without the mouldings or borders necessary to make up a complete decorative scheme, will not be taken into consideration. The designs must have been made between April 1, 1907, and March 31, 1908.

The recipient of a prize awarded under this trust in 1893 or 1897 cannot compete again.

The designs are to be submitted, with other schoolwork, in the usual manner to the Board of Education, South Kensington, in April 1908. Each of the imperial sheets, forming a set of competing designs, must be marked "In competition for the Stock Prize," in addition to being labelled or staged according to the regulations of the Board of Education.

BUILDINGS AND FRESCOES.

A LECTURE was delivered on Friday at the Royal Institution by Professor A. H. Church on the "Conservation of Historic Buildings and Frescoes." One of the agents which brought about the destruction of stonework in towns was sulphuric acid, though water, which acted as a carrier for the sulphuric acid and as a solvent for the sulphates formed, and also did damage by condensing on frescoes, could not be neglected. It had been calculated that the amount of sulphuric acid poured out into the air of London amounted to between half a million and one million tons annually. Most of the sulphur in coal escaped as the coal was burnt in the form of sulphuric and sulphurous acids. Illuminating gas was a minor source of sulphur, but the amount it contained had trebled since October 1905, when the regulations restricting the amount of sulphur allowable in London gas had been relaxed. There was also sulphur in paraffin oil. The effect of the sulphuric acid in the atmosphere was that the carbonate of lime of the stone was converted into sulphate, the carbonic acid escaping. To treat stone which had decayed through action of this kind with limewash, as was sometimes done, was unsound in theory and ineffective in practice. It was preferable to employ repeated coats of a 3 per cent. solution of baryta, applied as a fine spray, in cases where the surface of the stone was very tender, and with a rose syringe or a brush as it got stronger. The baryta water was absorbed by the stone and converted the sulphate of lime formed by the action of the sulphuric acid into calcium hydrate; this by absorbing carbonic acid from the atmosphere gradually became carbonate, and thus the stone was hardened and reconsolidated. The baryta permeated through the stone, and its effect was not to form merely an outside scab on the surface, as had been suggested. This treatment was not suited to stone which had been simply weathered by water and carbonic acid, but the presence of sulphate of lime in the decayed stone to the extent of 2 per cent. was sufficient to render it applicable. There were advantages in associating with the baryta a treatment with ceresin wax, which had also been used alone, with apparent success so far, in the case of some modern buildings. Ceresin wax was also useful for mural paintings; besides waterproofing the surface, it had the property of reconstituting the ground and thus of enabling repairing touches of colour to be put on.

Mr. Wade, the sculptor, has been commissioned to execute the first statue of the Princess of Wales as a pendant to his statue of the Prince of Wales, already unveiled at Hong Kong. The same sculptor is completing two statues of the Queen, one of which is for the London Hospital, and another statue of the Prince of Wales for Bombay.

NOTES AND COMMENTS.

THE new music hall in the Rue de Clichy, Paris, of which M. AUBURTIN is architect, is entitled "The Apollo," and presents at least one novelty in its arrangements. After the spectacles the floor used for stalls and pit will be utilised for dancing, a mode of enjoyment which finds favour with the inhabitants of the Clichy quartier. The change will be accomplished without the delay which at one time was necessary when the ring of an English circus was transformed in order to accommodate spectators of a theatrical performance. By the aid of an electric motor the floor of the Apollo will descend about 40 feet into a basement, the chairs will be quickly removed, and a waxed horizontal floor will be introduced instead of the inclined floor. The floor will then be elevated. For a time the movable floor will be an attraction, and it may suggest changes in other places of amusement, for apparently it is now impossible to have an excess of variety.

THERE will be a visit to-morrow by members of the Edinburgh Architectural Association to Bangour village asylum. In arrangement it differs from existing asylums on the "pavilion or block and corridor system." The suggestions offered by that of Altscherbitz, in Saxony, which is composed of a series of detached buildings distributed without formality or attempt at regularity, have been adopted. A chief feature in the "villa or segregate system" is the avoidance of everything suggestive of restraint, such as enclosing yards. The buildings are of comparatively small accommodation, and with their surroundings are treated with such variety of form and environment as to destroy all appearance of official residence. The main divisions of the group are the "medical section," on the east side of the estate, and the "industrial section," on the west. Between the two sections are (in separate buildings) the washing-house, laundry, kitchen and stores and bakery, and near to these are a series of workshops for the male patients, with boiler-house, coal stores, engine, dynamo and accumulator-rooms. At the approach of the eastern side of the estate are the administration house and, connected with it, admission wards for male and female patients respectively. Around the administration house are villas for the accommodation and observation of recent and acute cases. A large hospital is on the northern slope of the ground, and near by a nurses' home. On the western side of the estate are the industrial homes, those for male patients being grouped on the northern slope and those for female patients on the southern slope, the latter being near the washing-houses and laundry, where they may be employed. An extensive and completely equipped farmstead, with piggeries, byres, &c., situated at the north-west corner, has been modernised out of existing buildings and slightly added to. A recreation hall is in course of erection, and is conveniently placed near the middle of the grounds. The village is self-contained, having its own reservoir and water supply, a complete and independent system of drainage in duplicate with terminal septic tanks, an electric-light installation with generating plant, telephonic connection between the buildings and a system of electric clocks. Of roads constructed there are about 6,850 yards, or nearly four miles, and the aggregate length of drains, water mains, cables, telephone wires, &c., reaches 28,180 yards, or over sixteen miles.

ILLUSTRATIONS.

NEW PREMISES, CORNER OF LOTHBURY AND PRINCE'S STREET, BANK, E.C.

NEW POST OFFICE, ABERDEEN.

THIS important public building is now completed, and was opened for public use on April 6. The building, which rises three storeys high above the

street level, covers an area of 2,582 superficial yards and has a frontage to both Crown and Dee Street. The public entrance porch is placed in the centre of the Crown Street front and gives access to the public office which has a floor area of 2,000 superficial feet and ceiling 20 feet high. This apartment is the architectural feature of the interior; the walls are lined with marble to a height of 9 feet, the floor is of mosaic, the woodwork of wainscot and the ceiling panelled. The public counting-room forms three sides of a square, and has a total length of 84 feet. An inside posting-box is provided in the public office, and public telephone call-boxes are also conveniently placed. The public outside posting-boxes face down Crown Street towards Union Street. Other two entrances in Crown Street conduct respectively to the Public Inquiry Office on the street floor and the surveyor's and postmaster's rooms on the first floor. The top floor of the Crown Street block contains a telegraph school, telephone-room, mechanics' room, &c. The whole area of the street floor between the Crown Street and Dee Street blocks is taken up by the letter and parcel sorting office, with a floor area of over 11,400 superficial feet. The mail-loading platforms are on its south side, with gateways to both streets, while on the north side additional loading accommodation for Christmas and other exceptional traffic is provided under a covered annexe. The Sunday letter-callers will enter this annexe through a door in Crown Street, receive their letters and pass out on to Dee Street. Upon the first floor of the centre connecting block the medical officers, pay officers, telegraph engineers, &c., are accommodated, whilst the top floor is entirely occupied by the telegraph instrument room, which has a floor area of 4,520 superficial feet and an open ceiling averaging 20 feet high. The street floor of the Dee Street block contains the telegraph delivery-room and bicycle-room, also a retiring-room for postmen. Two staircases, with entrance from Dee Street, give access to the first and second floors, on the former of which are placed the station dining and serving-rooms and large sorters' retiring room, whilst the latter is almost exclusively given over to the Great Northern Telegraph Company. A well lighted and ventilated basement extends under the whole area of buildings, providing ample accommodation for basket storage, heating chambers, battery-room, &c. The whole structure is of modern fire-resisting and hygienic principles, and both street fronts are faced with Kemnay granite. The buildings, though only three storeys high, attain a general height to the top of the parapet of 58 feet above the street level, while gables and turrets rise still higher and show a well-broken sky-line. Architecturally, the design is in the spirit of the Scottish Baronial, but necessarily adapted to meet the requirements of a public building. The curved line of Crown Street lent itself admirably to this treatment, and permitted the introduction of some characteristic features of the style. The Dee Street elevation, having a straight frontage, is naturally treated in a much simpler manner. The granite carvings, although notable in their way, are kept secondary to the architectural lines, and the effect depends chiefly on the grouping and the light and shade of the masses, the variety of the sky-line and the treatment of detail. The building was designed by H.M. Office of Works, Edinburgh, under the direction of Mr. W. W. ROBERTSON, late H.M. principal architect for Scotland, but was carried out by Mr. W. OLDRIEVE, F.R.I.B.A., H.M. principal architect for Scotland, the cost being over 50,000*l.* The clerk of works is Mr. J. REID, and the general contractors Messrs. PETER BISSET & SONS, of Aberdeen.

MANOR HOUSE SCHOOL, CLAPHAM COMMON, S.W.—THE ENTRANCE

LEGAL HINDRANCES TO MODERN METHODS OF BUILDING CONSTRUCTION.

EGISLATION with reference to the construction of buildings in this country has been mainly directed to questions of stability, sanitation and fire risks. The present paper is intended to direct attention to some points upon which the law has hindered progress and unnecessarily restricted freedom of design and economical construction.

It may be assumed that the intention of existing Acts is the benefit of those who occupy buildings and their neighbours, but the difficulty of carrying out good intentions without doing unintentional harm is perhaps greater in the case of legal enactments than in the case of individual operations.

The reduction of general principles to specifications of materials and dimensions is no easy matter if the results are to be sufficiently precise to be generally understood, and it is not surprising that there is too much in existing building regulations about old-fashioned methods of construction, and not enough latitude for the introduction of new methods.

The main idea of stability from the official point of view is conveyed by specifying the thicknesses of outside brick walls and party walls.

The inside is left to be dealt with by the architect practically as he pleases, but the cross walls and floors, and the methods by which they may be bonded or tied into the outside walls, are not properly taken into consideration as regards their influence on the stability of the outer walls. A cross wall may or may not be a real stiffener to an outer wall, according to the nature of the bond, position of doorways and other matters. A floor also may be of very little value as a stiffener to an outer wall, as, for instance, when the joists run parallel to the outer wall, and also when the joists rest on a wall-plate and carry little or no load. Frictional resistance (*i.e.* statical friction) plays an important part in the stability of ordinary brick or masonry buildings, the "tie" obtained by girders, joists and roof trusses being mainly or solely dependent upon their own weights and their loads. Recognising this fact, it may be admitted broadly that the existing regulations as to thicknesses of brick walls represent reasonable "average" requirements for safe work, but the averaging is done over a wide range of conditions that it does not represent the same margin of safety always. In some cases the margin, as interpreted by surveyors, shows a very small margin of safety, whilst in others the margin is extravalently large.

Thickness of Walls.

Brick buildings, if well designed to get the best stiffening from cross walls, chimneys, girders, &c., might often be made with thinner outside walls than the regulations require, and yet be stronger than others which comply with the present rules.

The matter becomes much more obvious in the case of modern structures where steel frames and ferro-concrete are adopted. In such cases the existing London rules as to thickness of walls are simply absurd, and yet they are forced and large extra expense is incurred. Sometimes the design is modified in the direction of confining the steel to interior work and using it in conjunction with heavy outside walls, but this does not secure the full advantage of steel-frame construction, either in economy or safety.

The thickness of outside construction now recognised as efficient protection from the weather consists of slates or tiles laid on laths and a single lath-and-plaster ceiling or partition. It cannot be denied that this is practically satisfactory, although in high-class buildings roof boarding and felt sheeting are added.

Slates and plaster do not form so good a non-conductor of heat as a 9-inch brick wall with plaster inside, which is the minimum allowed for outside walls, and it must therefore be admitted that the 9-inch brick wall was not adopted as a minimum by reason of its warmth, but only on the question of stability.

Roofs and Top Storeys.

The official mind seems to have had a difficulty in drawing the line between a roof and a top-storey wall, and it is at the ludicrous rule that a slope of 3 inches in 12 constituted the difference. The Act of 1894 altered this to a slope of 75 degs., but the absurdity remains. The result was that Mansard roofs constructed of wood and

including two storeys might be built in place of brick walls. How the official mind reconciled this with the old rule prohibiting the wood frames of windows from being flush with the outside of the walls, for fear of spreading fire to other buildings, will probably never be known, but the result has been a large crop of unsightly attics in London buildings, which might have been built stronger and made more convenient and valuable without any extra expense if a light steel frame structure with vertical walls less than 9 inches thick had been adopted, and perhaps finished with a flat roof.

The two-roof storeys must now be built in fire-resisting materials throughout if the top floor is over 60 feet above the street. This rule is met by ferro-concrete construction 4 inches thick on a slope of 75 degs., but the buildings would be superior in strength if the concretework were to be built vertical.

Instead of insisting in all cases upon fire-resisting materials for roofs of these tall buildings, a more effectual provision for safety in case of fire would be that two staircases should be constructed from the top storey down to the second or third floor, where fire-escapes could be used. In hotels and large blocks of flats and offices this method would involve little or no inconvenience in planning.

The London Building Acts.

The London Building Acts (Amendment) Act, 1905, has added weight to the arguments for amending the law as to thicknesses of walls in steel-frame structures, without bringing any relief. The Act was promoted by the late County Council after the scare produced by some serious fires. The main object is to enforce the provision of easy access to the roofs of buildings, or other means of escape for use in case of fire. The promoters' benevolence does not extend to single families or even to two families who happen to be wealthy enough to occupy houses of four or more storeys—such people may still be allowed to roast; but if twenty persons who are not related to one another are to occupy a building they must have a dormer window opening on to the roof, and something to prevent them slipping off the roof when they get out of the window, or else a "Jack-in-the-box" trap door opening on to the top of the roof.

A little consideration will show that this law is very much in favour of flat roofs or roofs with parapets, and very much against the Mansard type with a slope of 75 degs., which has enabled architects to economise considerably in the construction of many buildings. The effect of the operation of this Act will probably be to materially increase the cost of buildings of the class affected, unless some alteration is made in the law as to thickness of walls, and the extra burden of this cost will come upon the occupiers to some extent.

The top floors of business buildings are naturally the least remunerative, and it is a serious matter if their cost is to be increased. The cost of an extra storey has at present to be reckoned practically as the cost of a new lowest storey with walls thick enough to carry the remainder of the building, and not as the cost of a 9-inch wall storey.

With steel-frame construction the difference between a top storey and a lowest storey is practically the cost of a few extra square inches of metal in the stanchions. The difference between ordinary and steel-frame construction is from two-thirds of a penny per cubic foot of building in favour of the steel frame in four-storey buildings, and may be considerably more than a penny per cubic foot according to the nature of the building. These figures do not take into account any allowance for the value of extra floor space obtained in the steel-frame structure, or for the saving in ground rent during the time saved in erection.

Dwellings for the Poor.

One of the most difficult problems of the day is that of providing dwellings for the poorer classes, and yet when any alteration of the Building Acts is discussed the idea of making building operations cheaper by scientific attention to details is usually overlooked, and the whole trend of proposed alterations is towards increase of cost, following on more stringent, or rather more dictatorial regulations.

The attempts of the London County Council to provide dwellings for the poor upon a self-supporting basis have been a conspicuous failure on the whole. Their tenements are either let to a class of tenants superior to those for whom they were intended or they are not let at all, and the financial return is perhaps too delicate a question to touch upon. Why are these things so?

Every architect knows that it is much more difficult to

plan, convenient dwellings, fitted with modern conveniences and sanitary arrangements, upon a very small scale, than upon one where the size of the rooms is not severely limited, but is it generally recognised that these pinched plans applied to large blocks of buildings under existing laws result in structures which have an excessively large factor of stability, an excessively large waste of space by thick walls, and consequently are unnecessarily costly?

Building Laws and Private Enterprise.

It is the building laws that constitute one of the chief hindrances to the investment of private capital in dwellings for the poor. The building trades' unions might do much to solve the problem by using their own funds and their own unemployed labour to create house property of the kind needed, a portion of which they might perhaps hold permanently.

It is not improbable that financial help could be found from outside if these unions would consent to work on a profit-sharing basis when general business is slack, and, bearing this in mind, it would be worth their while to lend their influence towards amendments of the law to render more economical construction possible. The type of buildings to which these observations chiefly apply are those having two or more tenants and two or more storeys.

One of the most promising efforts to solve the question has been made by the Camberwell Council, who have bought up old houses and rearranged them for letting in tenements.

There are thousands of privately owned small houses in London, originally built for single tenants, which are similarly treated, but it is only a makeshift, and there is not very much room for economy in construction in double tenement houses, but there is plenty of evidence of a demand for specially constructed double tenement houses in several London districts.

In the author's opinion there is room for a very large economy in construction of three-storey houses containing from four to six tenements with perfectly sound building construction, under new regulations, and that these might be designed either as detached blocks or in terraces. Such buildings should be arranged to utilise every cubic foot of available space in the roofs as bedrooms, cupboards, &c.

At present the waste of roof space in suburban buildings is simply absurd, and having regard to the importance of providing at least three bedrooms in a tenement occupied by a workman's family, it is preposterous that any petty obstacle in the way of unnecessary building regulations should prevent this being done, at the trifling expense involved in adapting the roofs as attic bedrooms.

Under Part I. of the first schedule to the London Act of 1894 it is laid down that $8\frac{1}{2}$ -inch walls are limited to 25 feet in height and 30 feet in length to serve not more than two storeys. It is also stipulated that no storey shall be more than 10 feet high with walls of this thickness. Presumably, therefore, it is recognised that upper floors do or may add to the stability of the wall, but there is no obligation to tie these walls to the floors when they run parallel to the joists, and as a matter of fact, they are usually quite independent, and consequently there is abundant evidence in existence of $8\frac{1}{2}$ -inch walls standing safely without horizontal staying for a height of two storeys, or 18 feet to 20 feet, but they would have a larger margin of safety if they were stayed by a floor, and a still larger margin if stayed by two floors. The definition of a cross wall in clause 11 practically excludes all the internal walls from recognition as having any influence upon the stability of the outside walls, and no notice is taken of the buttress effect of chimney-breasts, or as to whether the area of openings is half the area of the wall or only one-fourth of the area, and whether these openings cut into more or less than half the length of the wall. This is all very loose and unscientific treatment of a serious question.

Suburban Buildings.

A large number of buildings are erected in the suburbs in which the 30 feet depth is adopted to keep within the single brick wall limit, but the back main wall is cut through by a door to give access to "back addition," and also for a wide bay window to the chief back room, the two openings together extending over two-thirds of the length of the wall. Bay windows alone are permitted to cut out three-fifths of the length of a wall. A much better plan could often be designed with a depth of more than 30 feet, dispensing with the back addition and bay window, and cutting away a smaller proportion of the length of the main back wall.

Now, as to limiting the number of storeys of a single brick wall house to two, it will be clear that when the openings are limited to half the length of the wall it will be stronger than with openings of two-thirds of its length. Also that if it is properly tied to the floors it will have greater stability than if not tied. With regard to the ability of $8\frac{1}{2}$ -inch walls to support two upper floors, it may be noted that in interior work they are frequently used to support three or four floors, and $4\frac{1}{2}$ -inch walls are used to support two or three floors. The chief difference between these and outside walls is the possible thrust of roof members and wind pressure, both of which concern the lateral stability of the external walls.

It is not possible within the limits of this paper to enter into detailed calculations on these points, but it will be obvious that the horizontal thrusts of rafters can be completely taken up by proper ties, for instance, by using a wall-plate to serve the attic floor joists and as pole-plate for the roof rafters, and by inserting special ties on the sides where the joists are parallel to the wall.

Ferro-Concrete Construction.

No special effort is made in ordinary practice to tie floors to walls, but much improvement is possible in this respect, and also in the adoption of suitable lintels in place of arches over openings.

The author suggests the use of ferro-concrete lintels faced with stucco or artificial stone, and ferro-concrete bars for wall-plates and bonding purposes in a manner which has not (so far as he is aware) been hitherto adopted. Old-fashioned bond timbers were intended to serve a good purpose, but their liability to rot and to be damaged by fire has put them out of use. Their purposes, however, can be far better served by ferro-concrete bars, moulded in rectangular boxes and allowed to set for a month before erection. These bars could be conveniently handled in straight lengths of 10 feet or more. They can be made in L shape for use at corners of buildings and T shape for bonding outside and cross walls together. The bonds must extend to the full thickness of the wall and be finished with artificial stone string-courses on the outside. In cases where the floor joists run parallel to the wall the ferro-concrete bond can be bolted to one or two joists at the middle of their span and enable the stiffening power of the floor boarding to be adequately communicated to the wall. Where fire-resisting floors are used the bond will form a good abutment on the wall, and can be properly bolted to the two nearest parallel steel joists or ferro-concrete beams.

Prior to 1894 a floor up to 25 feet span between external walls was admitted as a stay, and the restriction as to length of wall of a given thickness was inoperative. This provision would rarely have effect because buildings usually have some internal partition wall between. The concession is now withdrawn, although it would have been wiser to extend its scope to include cases where floors are well tied together right through the building either in one span or more.

Arches a Source of Trouble.

A fruitful source of trouble in brick buildings is the use of arches over windows and doors. It is equivalent to the insertion of a number of wedges into a material which is not remarkable for its cohesive strength.

Arches are built frequently with totally inadequate abutments, and there is nothing in the Building Act to indicate the proper proportions of abutments. The insufficient provision to take up the thrust of arches and of rafters leads to the development of cracks in thousands of instances, and if these disintegrating forces were to be effectually eliminated, as they can be, the strength of the average suburban house would be very largely increased, and thinner walls would suffice for buildings of more than two storeys. The solution as regards arches is to use lintels of wood, stone or concrete in short lengths, or ferro-concrete or steel in longer lengths.

Hip roofs are peculiarly liable to weaken a building, because the attic floor or ceiling joists cannot act as ties in two directions. Text books explain how to put in angle braces and dragon ties, but they are rarely adopted, and indeed they are not sufficient to deal with the strains which occur at the corners of buildings with a proper factor of safety. Ties of a more extended nature are required, but the internal arrangement of buildings varies too much to lay down a simple rule for general adoption. The factor of safety at the corners of hip roofs is often so small that cracks are certain to occur sooner or later in 9-inch walls.

as the strained materials grow "fatigued." Scientific planning of ties will effectually prevent such troubles.

If high-pitched roofs are adopted and utilised to the fullest extent for attic rooms the use of hip roofs will be more rare and gable ends will be more generally adopted for semi-detached houses and blocks of tenements.

No building in London over 50 feet high is allowed to have 8½-inch walls enclosing the top storey, and in view of the risks of ordinary brick walls falling in case of serious fire it is no doubt wise to insist on some extra stability at great heights to compensate for the flexibility of the lower 50 feet of wall.

In a steel-frame structure the frame will do all that is necessary in this direction, but in other cases the judicious use of ferro-concrete bond courses and lintels will make an 8½-inch wall safer than a 13-inch wall without them.

Steel-Frame Construction.

The principle of the brick-wall rules has been given way in favour of steel frames or cast-iron columns to suit the requirements of shop fronts, and this loophole completely disposes of any possible sound or plausible argument against the extended use of steel-frame construction and thinner outer walls for buildings for other purposes than shops. The margin of stability of some shop buildings, particularly at corners, is remarkably small in many cases, and it gains nothing by the insistence upon thick walls over and over again. A continuance of the steel-frame structure upwards with thinner walls would secure greater stability.

A really scientific Building Act would not contain much detail about dimensions of brickwork, but would lay down limits of loads upon unit areas of materials which must not be exceeded, loads upon unit areas of floors that must be provided for, and minimum factors of safety which must be adhered to in all parts of the structure not particularly specified.

Suggested Amendments to the London Building Acts.

About three years ago the Royal Institute of British Architects prepared a set of suggested amendments to the London Building Acts, dealing with steel-frame structures, and they were drawn up upon a more scientific basis than the bulk of the existing Acts, but they proposed that the closing walls of the top 20 feet of the building should not be less than 8½ inches thick, and the remainder 13 inches thick 8½ inches for the window backs, and that where stone masonry is adopted these thicknesses should be increased by 2 inches. It is not easy to see why any distinction should be made between the top 20 feet and the remainder of the building as regards thickness of walls, as the increase below adds to the weight and the cost without improving the stability. If people liked to adopt 13 inches for the sake of warmth they could do so, but it should not be made compulsory. The Institute did not appear to contemplate any new departure in brickwork except using cement throughout, and they wisely refrained from advocating American skyscrapers.

There is much commendable matter in the existing Acts to guard against excessive heights and to secure adequate light and air, but it is too rigid and not all sound principle. For example: what advantage is it to anyone to insist on the back of a building being cut off by a diagonal line on a slope of 67½ degrees when the building happens to face north, and there is no other building within 50 feet of its back wall? The slope does not bring any sunshine to a neighbour or help him to breathe.

Clinker Concrete Buildings.

A description has been published recently of some blocks of workmen's dwellings erected in Liverpool to the designs of the city engineer, Mr. J. A. Brodie, M.Inst.C.E. These buildings are three storeys high, and are built entirely of clinker concrete slabs, made in sizes up to 16 feet by 11 feet. The outer walls and party walls are 6 inches thick throughout, with steel reinforcement strips in both directions so that no areas equal to a square yard are left without reinforcement. Mr. Brodie wished originally to make these slabs only 7 inches thick, but the authorities failed to support him, and consequently the buildings were far more costly than they need have been. The interior walls were made of similar slabs 6 inches thick and up to 16 feet by 11 feet. Mr. Brodie informs the author that the cost of making these large slabs, 6 inches thick, is under 3s. per square yard, exclusive of subsequent handling. This is under 15s. 6d. per cubic yard. The reinforcement is put in chiefly to facilitate handling without damage, and is not relied upon to support loads, though it does, no doubt, stiffen the structure.

The economy of using these large blocks of concrete (weighing from 4 to 10 tons) depends upon the total amount of work to be done being sufficient to justify the provision of powerful plant to erect them. In large blocks of buildings or long rows of small ones there would be a great saving over brickwork, but for a few small cottages it would not pay, and in such cases 9-inch brickwork with ferro-concrete bond courses will be hard to beat. In tall steel-frame buildings big slabs of concrete could be used without any serious difficulty, and the rapidity of erection would astonish most people.

Time and Labour Saved.

City building operations in the future will probably be conspicuous by the smaller proportion of manual labour upon the scaffolding as compared with present methods. A further saving of time will be secured by the more rapid drying of thin walls ready for plastering and decorating. In some provincial towns in England and Scotland large blocks of shops and offices have been built with ferro-concrete walls only 4 inches and 6 inches thick, and the cost of such walls is found to be equivalent to 13-inch brickwork, and therefore the economy only comes in where they replace brick walls 18 inches thick or more. London is at present prevented from realising any such economy.

In advocating the use of concrete for outside walls to a body of architects, the author is well aware that the question of its appearance will be prominent in their minds. Plain concrete either in slabs or cast *in situ* will never give general satisfaction. A finish of reasonably uniform texture is necessary. Plain stucco has been accepted very largely in the past, and may be adopted again more largely than at present. Rough-cast stucco is a very suitable finish for concrete walls, and is cheap and pleasing in appearance when not used over too large an area. A face of terra-cotta, glazed tiles or artificial stone can be adopted for thin concrete walls without any difficulty by making the facings with dovetailed projections to tie into the concrete.

This kind of construction need not be entirely put together on the building. It is quite feasible to construct large slabs of concrete with ornamental facings properly set in the builders' yard, and to bring them to the building as required with the faces protected by wooden shutters. For rapid building this course seems very desirable. The size of the slabs will be determined by the facilities for handling by cranes. All these methods of treatment are suitable for walls 6 inches thick and upwards. Steel-rod reinforcement will be usually desirable, but not always necessary.

The Use of Masonry.

For the highest class of buildings the architect will never be persuaded to entirely abandon masonry, and there is no reason why he should, but its use will naturally involve walls more than 6 inches thick. A wall 9 inches thick can obviously be built in solid ashlar, but it is not actually necessary to have more than a facing of ashlar with stretchers 3 inches and headers 4½ inches thick, grooved to form a slight dovetail key to a cement concrete backing with steel bar reinforcements. This can be carried out on the slab system, and will be less liable to the penetration of damp through the wall than plain ashlar.

It is not a new thing to make concrete blocks with stone facings. The system has been adopted for important engineering works, notably at Dover harbour, where small granite facings have been put on large concrete blocks and kept to set hard before depositing in the work. The same thing has been done in other places where the severest battering by waves occurs, and that fact should be remembered, if the use in architectural work is criticised as a weak "vener" of masonry.

Hollow walls should be permitted under conditions such as are recognised in America and Germany, to secure greater stability and warmth with a reduced weight of material if it is properly designed.

Party Walls.

The rights of adjoining owners as to party walls might with advantage be made to include provisions that when a building owner gives notice to an adjoining owner of his intention to pull down a party wall, either owner should be entitled to require that the wall shall be rebuilt as two thin external walls in steel frames or ferro-concrete, and thus dispose of the possibility of a repetition of the trouble, and also enable the adjoining owner's building to be restored to its normal habitable condition far more rapidly than is possible under present methods. In this connection the use of rolled steel joist grills in the foundations is desirable as

a base to carry either wall, with joists projecting under the other, and is preferable to the lop-sided brick footings which are now permitted.

One way of providing for the approval of new methods of construction would be by authorising the Local Government Board to accept new designs upon the written advice of architects and engineers, to the effect that such designs are equivalent in quality of materials and stability to designs made in accordance with existing regulations. The Local Government Board could refer any case to a Tribunal of Appeal. When the new designs or specifications of new materials have been accepted copies should be deposited in an office, accessible to the public, under registered numbers. Applications to any local authority for the approval of plans of new buildings which contain features based upon registered designs should be accompanied by a certificate from an architect or engineer, stating the numbers of those registered designs and the nature of the features adopted. The district surveyors could be authorised to pass plans coming to them with such certificates, or to require them to go before the Tribunal of Appeal and be registered if approved. The gradual accumulation of registered designs would afford valuable records of matters which have been thoroughly discussed by competent persons, and save a large amount of time which might be wasted in the preparation of unpassable plans. It would also afford the best possible data for the periodical revision of the standard regulations, which ought to take place every five years.

The editors of technical journals and others could be relied upon to publish copies of important registered plans and digests or reference indexes to these plans, and thus render valuable services to professional men by keeping them posted up in "Registered Building Precedents." Procedure on these lines should act in favour of steady, sound progress, and keep in check the jerry-builder.

A good deal is heard nowadays about standardisation in industrial matters, but standardisation may lead to stagnation and act as a hindrance to scientific progress, and it certainly has done so in the building trade, both by preventing the adoption of new methods and by preventing persons from deriving the full advantage of scientific attention to details.

General Recommendations.

To summarise the foregoing remarks in the shape of general recommendations the author advocates:—

- (1) The adoption of the suggestions of the Institute as to steel-frame structures, subject to thinner walls being permitted as stated and some minor modifications.
- (2) The admission of complete ferro-concrete thin wall structures of equal strength to approved brick wall rules.
- (3) The admission of an extra 10 feet storey in 8½-inch brickwork on top of walls of the dimensions stated in the present Acts for walls of restricted length, but applied to unlimited lengths, provided that due regard is paid to ties in floors, cross walls and roofs, and the use of ferro-concrete bond courses, wall-plates and lintels.
- (4) Facilities for abolishing party walls and substituting two thinner walls in steel frames or ferro-concrete construction.
- (5) Facilities for getting new designs and methods of construction approved from time to time by a competent tribunal and placed on record for public information.

This summary does not complete the whole subject, but the author hopes it will serve as a satisfactory basis for discussion.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. Walter Cave, vice-president, in the chair.

On the motion of the Chairman, votes of thanks were passed to Mr. Andrew Oliver, who had completed the rearrangement of the large collection of seals belonging to the Association, and to Mr. Maurice B. Adams for the presentation of a collection of foreign architectural publications.

The CHAIRMAN announced that the annual dinner would be held on Friday, May 3, at the Georgian Hall, Gaiety Restaurant.

The following gentlemen were elected as members:—Messrs. P. J. Adams, P. M. Andrews, H. M. Archibald, F. E. Cannon, W. G. L. Cheriton, D. H. Fish, W. S. Grice, F. B. Last, H. T. Lubbock, A. H. Moberly, H. E. Moss, E. W. Mountford, H. R. Peerless, A. T. Phillips, R. Phillips, C. B. Reid, A. W. Robertson, A. L. N. Russell, R. Walker, H. Skyrme, D. Colville, T. Swales.

Mr. JOHN A. MARSHALL read a paper on

Westminster Cathedral.

He said:—Twenty-eight years ago, in a house once occupied by Edmund Burke, who wrote an essay on "The Sublime and the Beautiful," a number of assistants were engaged in working out the designs of a well-known architect. These designs were for important buildings in all styles, ranging from the Romanesque to the Renaissance, and they showed a power and a knowledge of detail unsurpassed, we believe, at that time. Before entering on his duties the assistant was told that he would not be expected to design, but merely to exercise care and judgment and to take an interest in his work. From the time when he entered this realm of art in the morning until his departure in the evening he was virtually a prisoner, and the annual holiday was a reprehensible undertaking rather than a recognised institution. Smoking, whistling and gossiping were strictly prohibited, and to take off one's coat for greater freedom or coolness was pre-eminently disrespectful, not to say vulgar. But undue restraint—if such it was—engenders reaction, so whenever a suitable opportunity occurred—it may seem strange to you—conventional was cast aside for uncontrollable outbursts of boyhood; the sublime and the beautiful were then forgotten, and no thought was given to the occupant of the room below until we received this charming admonition from our respected master:—

13 John Street, Adelphi, W.C.: April 3, 1879.

Gentlemen,—Mr. G. writes complaining of the unnecessary disturbance you indulge in, and requests me to ask you to refrain from making more noise than is essential to the performance of your duties. I feel sure, after this, neither of you will give cause for further complaint, inasmuch as it is unbecoming to engage in acts that affect the dignity of an office and the peace of a neighbour.—Yours faithfully, JOHN F. BENTLEY.

And now, gentlemen, in the face of this somewhat humiliating confession, you will understand that we scarcely dared to presume to accept the invitation of your Council to read a paper on the Westminster Cathedral, and in view of what has already been written on this great work of Mr. Bentley's by men of "light and leading," we have also confessed to a feeling of surprise that the subject should be considered to possess some latent interest that has not yet been revealed. Perhaps it was hoped we might be able to explain the apparent incongruity or contradiction in the last phase of Mr. Bentley's artistic development, how—the Athenæ from the brain of Zeus—this strange design, of noble proportions, could be produced in so sudden and complete a manner, by one of the latest exponents of the Gothic Revival. Or was it expected that some light could be thrown on Mr. Bentley's intentions respecting the completion of a building that may be said to rank with those of national importance?

As the effacement of man's work—by the hand of time—increases our curiosity to look into the past, so does the unfinished production impel us, with equal and perhaps pardonable curiosity, to look into the future; not merely to speculate as to what might have been had the master lived to finish his work, but to wonder what may happen in the absence of his guiding influence. You remember the touching incident related by Vasari, how the pupils of the immortal Raphael placed at the head of the bed on which their dead master lay his unfinished picture of the *Transfiguration*, while they stood around like helpless orphans. You will, I am sure, agree that that picture should have been allowed to remain just as it left the master's hand, without the profaning touch of any pupil. The simile need not detain us, yet we cannot forget that an unfinished building in occupation is not quite the same thing as an unfinished picture or piece of sculpture. Existing contracts have to be carried out, and the varied requirements of the occupants have in some way to be met; yet we all fully realise that the peculiar impress of the work carried out under the personal supervision of the original architect can never be revived, nor can it in this instance be emulated.

Reverting for a moment to the supposed inconsistency of style, it is not necessary to remind the members of the Association that the training of an architect is now very different from what it was ages ago, when the builders of each country worked in only one traditional style, but could easily be adapted to the simple requirements of the community. Then, the young architect, we are told, learned the principles of his art, profession or craft in the building, in the workshop and at the guild. His style

environment was redolent of lime, timber, stone; he was not afraid of soiling his gloves, nor of crushing his silk hat against the scaffolding; paper and rubber were not part of his outfit, and drawing, as we understand it, not one of his qualifications.

If one of these obscure cathedral builders could enter his room to-night we would ask him to tell us more about his life, and in return initiate him into the mysteries of modern architecture; he would then realise that the times had indeed changed, that vast storehouses of knowledge are open to him that were quite unknown to him, that the demands on the skill of our architects are so bewilderingly varied and complex as to prevent the universal application of any particular style, old or new, and that the lifework of a modern architect has not infrequently presented an epitome of the styles of all ages. He would learn that we spend most of our time in the "office," and some of it on the building. And, lastly, the perspicuity of our building regulations and the simplicity of our sanitary requirements would equally astonish him were it at all possible for us to explain them. If our visitor happened to be an English or French architect of the Mediæval period, he would, of course, not quite understand the style of the Westminster Cathedral. He might possibly detect in the plan the Christian symbol of the Cross, and he would recognise as his friends the gaunt Norman-looking transepts and the ill-buttressed choir; the sheer unbroken height of the campanile might win his admiration, but the inconsistent treatment of the roofing and the peculiarities of the west front would certainly puzzle him, and provoke the question as to whether these were the outcome of necessity or of design. If the exterior betrayed, to his mind, some slight acquaintance with the work of his own period, the interior would bear no such trace; for a moment the unconcealed sterility of its structure might remind him of some early Saxon or conventual church, but he would soon find that the resemblance was more visionary than real, and that for all it was not a Gothic building that had served as the prototype. He would rightly infer that it was not intended to show the brickwork into clustered shafts and mouldings, but until he detected the proposed scheme of marble and mosaic decoration his only conclusion would be that it was intended to plaster the whole surface with a view to painted decoration—or, possibly, whitewash.

Development of the Plan.

But let us assume that our visitor is one of those Greek architects who, we are told, crossed the Adriatic to build St. Mark's, Venice. On approaching the western façade he would be disappointed not to find a spacious and well-lighted outer narthex, forming an ambulatory or vestibule, comprising all the main entrances, but this feeling of disappointment would soon give way to one of satisfaction when he entered the nave and realised the striking influence of his own work after ten centuries of time. The main structural ideas, necessitated by the statical requirements, would be familiar, and so would the proposed method or scheme of applied decoration. He would note, however, with regret that the cruciform symbol on the plan appeared to be tolerated rather than emphasised, and we should hasten to explain that though the architect's starting-point was the basilica, his ultimate idea was an unbroken nave or hall some feet wider than St. Mark's, and that the transepts should be regarded as part of this space, but rather as extensions of the eastern chapels. "I see that is so," he would respond, "but in our basilica at Venice we made the transepts as important as the nave, and covered them with vaults in the same way, and I cannot help feeling that this arrangement—apart from any religious sentiment—is a perfect ideal, and gives additional charm or variety to the interior." "Possibly," we should cautiously observe. "And it may interest you, sir, to know that your church at Venice has been so much admired, since your retirement, that its predominant idea has been copied elsewhere almost line for line. And it may still further surprise you to learn that the architect's first conception for the Westminster Cathedral was a bold attempt to realise these very qualities which appeal to you so strongly."

regarded as the tentative scheme of a great architect for an important work, the first sketch plan made twelve years ago is interesting, though it doubtless lacks the homogeneity and the statical completeness of the final plan. And our friend being curious to know why this first conception was abandoned, we should have to explain that the architect considered the matter, the less satisfied with the transeptal arrangements and the "crossing" the abutment for these parts in the east was insuffi-

cient, and the complications connected with the exterior were not encouraging; then it was decided that the eastern termination of the church should not be used as a sanctuary but as a choir; it was also decided to limit the sacristies to one side of the building, and to rely on the aspiration of a single campanile, rather than on the conflicting efforts of two. In the revised plan the sanctuary and the choir have changed places; aisles have been introduced between the sanctuary and the eastern chapels, thus improving the abutment, but necessitating the abandonment of the apsidal terminations of the transepts in order to provide suitable approaches to the eastern chapels. The transepts having now lost their peculiar form, we find the architect resorting for internal effect to another ideal, which in the course of his practice had become so indelibly stamped on his artistic temperament that it invariably appeared in the churches designed by him. We refer to the unbroken continuity of the nave arcades and vaulting across the transept openings, without entirely sacrificing the cruciform plan. This unbroken rhythm or repetition of parts produces an impression of length and height—a vista, if you will—that was most attractive to the English architect. And we should ask our visitor whether a similar effect was not produced by filling in the side arches of the great prototype at Constantinople. "Quite so," he would reply, "but in that case the artistic effect of the expedient was not the primary object, and the buoyancy of the culminating dome has scarcely been impaired. Permit me, further, to say that I think I now realise what I may term the vital difference between your cathedral and our great churches of the East. At Constantinople and at Venice the supports are concentrated or limited to a few positions, whereas at Westminster, in addition to the main supports, auxiliary piers and arches are introduced that give a distinctive character to the design, suggestive, if I may say so, of a commingling of our Eastern with your Western methods; it is only in the sanctuary of your cathedral that I can detect the structural lines of the Greek type reproduced in their integrity."

Again, it would be still more interesting to some of us to know the views of yet another architect, of a period still more remote, one of those builders of Imperial Rome whose colossal works are still the wonder and admiration of the world. We should prefer to conduct this gentleman, blindfold, into the cathedral, and suddenly reveal to him the vast expanse of its interior; then, if he did not think that he was in the tepidarium of a large bathing establishment, we should say that he had never seen one. The length of the nave agrees with that of the central hall of the Thermæ of Diocletian, but the width, instead of being merely 60 feet, as it is, should be increased to 80 feet; then, if the secondary piers and arches are obliterated—thus reducing the supports to eight in number—and the pendentive system of vaulting changed into the groin vaulting of the Romans, the illusion will be well-nigh complete. On leaving the building our Roman visitor would be startled, not only by the determined aspiration of the campanile, but by the ornate qualities of the exterior generally; he would miss the sturdy vigour of his own work, and his limited acquaintance with architectural styles would not enable him to detect the strong influence that Byzantine, Romanesque and Renaissance detail have had on the design.

Having now, by retrogression, drifted to the source of the Renaissance, there is an obvious temptation to overleap the intervening ages at a bound, and so reach that "harbour of refuge," that "sheet anchor," of the modern practitioner. We do not, however, propose to invoke the shade of any past, nor the person of any living votary, of that accommodating and fashionable style; and cordially as we should welcome the apparition of the greatest architect of the English Renaissance, we appreciate the delicacy of the situation and proceed without further delay to take a closer view of our subject.

Support and Abutment.

You will have gathered that the dominating factor of the problem worked out by the architect has been a spacious and uninterrupted nave, covered with domical vaulting, and it will be obvious to you that the exceptional width of the space to be covered called for exceptional height if due proportion of the interior was to be maintained. Thus the difficulties of support and abutment were soon realised, and in selecting the pendentive dome of shallow concavity for the roofing the architect believed that the weight and the pressure would be reduced to a minimum. By showing the domes outside not only was an extraneous roof dispensed with, but full advantage of the height was gained for the interior. In the disposition of the piers and abutments,

with a view not only to the sustentation of the pressure but to reserving as much space as possible for the aisles, chapels and galleries, a system has been adopted not unlike that to be seen in most Gothic cathedrals, where huge yet narrow counterforts are projected at intervals and stiffened by transverse walls, arcading and vaulting; but while in a Gothic cathedral these counterforts are generally most conspicuous features outside the building, at the Westminster Cathedral they are practically limited to the interior, the spaces between being entirely utilised. It may be noted in passing that in the latest instance of cathedral design in this country both these methods have been rejected in favour of one in which all buttresses as such are avoided by deeply recessing the alternate bays as transepts, and should this arrangement involve a sacrifice of that uninterrupted succession of parts that Mr. Bentley so much admired, it will be admitted that this is not the only quality that can be legitimately aimed at, and it is probable that the result at Liverpool may disclose quite opposite qualities that will fully compensate for the loss referred to. At present we can only wish every success to the young architect who is now engaged on this important work.

Confining our attention for a time to the nave of the cathedral, let us more carefully examine the counterforts and the vaulting they sustain. A reference to the plans will show you that only in one instance is a main counterfort permitted to retain what may be termed its simple, unaffected character, all the others being more or less influenced or modified by the exigencies of the plan; thus two of them form the flank walls of the transepts, where, on the east, they are further strengthened by the walls and vaulting of the sanctuary, so as to resist the cumulative pressure of the nave vaulting. At the west end of the nave the corresponding abutment has been very considerably affected—not to say weakened—in the upper part, by the retiring disposition of the western façade, a concession to light and air claimants. Of the secondary counterforts, those dividing the transepts have also a distinct and complicated character, while the others retain their simple form—excepting that next the campanile, but this of course affects only one side of the building. The proportions of each compartment of the nave are those of a cube, up to the springing of the main arches—60 feet from the floor. Another 30 feet 4 inches and we are at the springing of the domes; the total internal height being 111 feet, or about 10 feet higher than the choir of Westminster Abbey. The extreme projection of the counterforts is 48 feet, but just above the chapel vaulting this projection is suddenly reduced to 24 feet, at which it is maintained to a height of nearly 90 feet. The lower projections—forming the divisions between the chapels—are but little more than “flying buttresses,” filled in with thin walls, so as to form recesses for the altars. The enclosing walls, with the brick vaulting over the galleries and transepts, serve, of course, to stiffen the counterforts and to increase the abutment, but the lower concrete vaulting of the aisles and chapels is not so important in this respect, and its construction was deferred until the main parts of the building were finished and the full pressure of the superstructure had been realised. And here the suggestion can scarcely be evaded that this part of the design does not so exactly express the construction as do some of the other parts; for the massive walls of the triforium are not, as might be supposed, supported on the arcades that divide the chapels from the aisles, but on segmental relieving arches, turned over these arcades between the counterforts and concealed in the pockets of the vaulting. The span of each relieving arch is 25 feet, and the skewbacks are not cut into the piers, but are formed on granite springers that project beyond.

This expedient to reduce the span and maintain the piers intact was most essential next the transepts where the triforium wall suddenly stops, and the abutment has been weakened by the formation of a passage in the wall of the transept. In view of this and the complicated section of the relieving arches—due to the difficulty of clearing the vaulting of the chapels—you may perhaps wonder why so favourable an opportunity for the use of steel girders that involve no thrust and occupy but little space should have been neglected, but the architect resolved not to introduce into the cathedral any ironwork as a support, though, as we shall see, he did not feel justified in objecting to its use as a tie. The projections or buttresses between the lower windows of the triforium or gallery have an artistic value, though they serve no structural purpose. They are apparently supported on the flat roofing of the chapels, but they are really dependent on stone corbels that rest on the

relieving arches and bluish unseen. You will now see that the chapel arcades and vaulting are relieved of all extraneous weight, and it has been possible to make the arcades very slender, thus gaining extra space for the chapels, and imparting to these minor parts of the building a suitable relative proportion or scale. You will also now realise the importance of the galleries in disguising or masking the apparent weakness of the construction behind, just as a balcony is often projected along a façade as an antidote against the weak appearance of a ground-floor storey. The archways formed in the lower part of the counterforts, to preserve the continuity of the aisles, galleries and passages, have been kept as small as possible, but in the upper parts hollow spaces have been left to economise material. These spaces were not enclosed until the brickwork had been exposed some time to dry, and small openings for ventilation were left in the upper and lower parts of the cavities to facilitate the drying after the enclosing walls were built. It was also desirable to keep these walls down until the cavities were arched or corbelled over, as the case might be, to prevent the accumulation of rubbish that would have blocked up the ventilators at the bottom. The main counterforts are 10 feet 6 inches wide, and from these, at a height of 60 feet from the floor, spring the large transverse arches, 6 feet 9 inches wide, that support the pendentives and the dome. As the thrust exerted by these arches and the pendentives is at a level much below the springing of the domes, it was not considered necessary to raise the main counterforts higher than the lean-to roof of the passage over the triforium vaulting; but the secondary counterforts, placed opposite the centres of the domes, are raised well above these roofs and weighted with turrets, the supporting arch and wall at this level being comparatively thin.

We have already referred to the exceptional character of the counterforts dividing the transepts. These, you will notice, consist on the ground plan of two piers, one next the nave, the other next the outer wall, the space between being arched over, just above the level of the gangways and galleries that cross the transepts. To dispel the weak appearance of the pier next the nave, and to insure a uniformity of scale on the ground floor, the openings between the piers are filled in with arcades that agree in height with those of the galleries; but these arcades do nothing towards counteracting the thrust of the arches over, and indeed they were not inserted until long after the main parts of the structure were built. In building the pier next the nave the precaution had been taken to make it 9 inches wider than the corresponding piers of the nave, but this was not considered sufficient, so a rolled steel tie was inserted just below the springing of the arches, where it would eventually be concealed by the arcades; and at a higher level, just above the crown of the arches, another similar tie was built in. When it is considered that the turrets of the transept counterforts are directly over the arches, and that the arches sustain nearly half the weight of the vaulting and the roofing, and that one of the domes is partly dependent on the pier, it will be admitted that these precautions are not altogether uncalled for. At the west end of the nave the bewildering ramifications on the ground floor promise well for the abutment at higher stages of the work; but as we ascend, the gradual recession of the western façade soon dispels the illusion, until on the top stage, where the pendentives exert most pressure, we find that counter resistance has been reduced to a minimum. Another effect due to these legal restrictions appears inside the building, where the perimeter of the western dome seems to be too rare for the large west window; a deep barrel vault over the window, as originally intended by the architect, would have afforded better resistance and greatly improved the interior.

Having now considered the main features of the relieving arches regarding support and abutment, we will go back in our imagination to that stage of the work when the main supporting arches had been turned, and the centring or triforium was still in position, there to remain until the full weight had been imposed. On the north and south sides these main arches were not turned until the lower secondary arches and the brick filling over were finished, so that the brickwork served as centring for that portion of the triforium arch that passes through the wall; but for the projecting portion on which the pendentives rest it was, of course, necessary to provide thin centring of wood. At the springing level of all the arches and brick-barrel vaulting, rough stone corbels were built in to support the centring, the projections being afterwards worked off. The spandrels of the main arches are filled in up to the crown level with brickwork set back 13½ inches from the faces of the arches.

reserve a seating for the concrete of the pendentives. The visible junction of the brick arch and the concrete forms merely an angle or line, and if we follow these lines down to the springing where the supporting arches separate we shall find them meet, so that the surface of the pendentive expands or develops from a mere point; but this apparent weakness in the construction is obviated by the very common method of building the lower portion of the arches and the pendentives of brick in horizontal courses; thus a continuous joint is avoided by cutting the brickwork to the required angle, and the top of the brick corbelling forms a seating of considerable area for the solid concrete backing.

The lower portion of the pendentive, just described, rises to a height of 13 feet above the springing; fixed centring for this part was not necessary—the accuracy of the hemispherical curves being insured by the application of movable templets. But for the upper part of the pendentive closely boarded centring was necessary, and to support this at the bottom a projecting stone landing was built in on the top of the brick corbelling, the projection being afterwards worked off. To secure bond for the concrete backing of this upper part, and to distribute the bearing, 6-inch stone landings are built in at intervals in the height, across the angles formed by the enclosing spandrel walls. Projecting courses of brick are also formed on these walls to serve as a key for the concrete. To limit the weight the top part of the pendentive has no solid backing; it is, in fact, built as part of a dome, having a shell 2 feet 6 inches in thickness, but on this shell radiating counterforts or ribs are formed that incline up to the base of the dome, and on these counterforts there are light sleeper walls that support the flat roofing around. To ventilate the cavities $4\frac{1}{2}$ -inch drain-pipes were inserted in the shell and counterforts, communicating with the interior of the building. Constructionally, the pendentives may be regarded as corbels, by which the weight of the domes is not merely sustained, but directed to the piers.

Nave Domes.

The circle developed by the pendentives is 60 feet in diameter; the base of the dome is corbelled over from this, so that the springing is clearly defined, and a salient angle at the junction of the two surfaces is thus avoided, for the convenience of the mosaic workers of a future generation. The thickness of the domes at the springing is 3 feet, which is gradually reduced to 13 inches at the crown; the curve of equilibrium is, therefore, well within the material. The domes were turned on closely boarded centring, in a series of superimposed rings of concrete averaging 4 feet in width. The concrete was not reinforced in any way. The centring consisted of radiating trusses supported from the ground, on uprights 90 feet in height, made of stout planking, bolted together so as to break joint, and cross-braced at intervals. It was, of course, important to have the centring perfectly rigid, to preserve the true curvature of the concrete until it had finally set. Full responsibility for the centring rested with the builder who had contracted to carry out the work; and if his method lacked the daring and skill of a Brunelleschi or a Fontana, he certainly incurred no risk and did not stint the timbering. The eastern dome of the nave was turned first, then the dome of the sanctuary, next the middle dome of the nave, and, lastly, the western dome. Their construction occupied about fourteen months. The independent external covering of the domes is formed in 3-inch artificial stone slabs, cast to the curve. They rest on radiating ribs 5 inches deep, of similar material, fixed on the concrete and rebated to receive the slabs, thus leaving an air-space of 2 inches between the inner shell and the outer covering, the object being to render the temperature of the interior more uniform. The top and bottom joints of the slabs are rebated. At the springing and at the crown the spaces between the ribs are left open for ventilation, and to prevent the wet being driven into the cavities at the top, a circular raised curb is formed, on the top edge of the upper slabs, over which is placed a domical capping that allows the air to circulate freely. To form the outer covering more than 600 slabs were required for each dome; the exposed surface is, therefore, an elaborate network of jointing, and we cannot but feel that an outer coating of homogeneous asphalt would have been more impervious. You will note that by rebating the ribs for the slabs, each radiating section of the covering is kept in position independently of the rest. The concrete flat roofing around the domes is covered with asphalt that rises up the lower portion of the dome, to a height of about 4 feet 6 inches, under the outer covering, where it is keyed into the concrete.

The Sanctuary, &c.

The eastern portion of the cathedral, comprising the sanctuary, the lateral chapels and the choir, presents a system of construction essentially Byzantine, the luminous corona of the sanctuary dome being raised aloft on vaulting that seems to be independent of direct support. This buoyancy is due to the extensions that open out on all sides, equal in span to the dome itself. The enclosing walls of the sanctuary, on the north and south, have very materially affected the design of the eastern chapels. Originally, these chapels were to have been enclosed by slender arcades, on marble columns, corresponding with those of the organ galleries adjoining; but—as in the case of the chapels of the nave—it was soon found that these arcades would not be sufficient to sustain the weight of the walls over, which are the highest in the building; so the columns were changed into brick piers, and the two end bays of the arcades were filled in, leaving only two bays open in the middle and a couple of narrow doorways at each end, for access to the aisles. Over the filled-in bays are built the solid portions of the outer wall, against which the organs may probably be placed, while over the two open bays is built the lighter portion of the wall containing the windows. The weight of this central part does not, however, entirely depend on the arcade below, for above the two lower windows a relieving arch is turned that transmits the weight of the upper part of the wall to the solid portions at the sides, and to still further reduce the weight that portion of the brickwork under the relieving arch and between the windows is built hollow.

The Galleries.

The organ galleries are independent factors of the construction and, like the galleries of the nave, were left down until the main parts were built. The concrete vaulting of these galleries and the western gallery of the nave is not let into the walls at the back, but supported on brick and stone corbelling, so that the walls are not weakened; the concrete was, however, keyed to the wall by projecting courses of brick, and, as an extra precaution, the columns supporting the vaulting of the organ galleries are tied to the back wall by gun-metal ties, while for the west gallery of the nave ties were inserted at the floor level of the gallery, where the wall of the narthex has most resistance. The side galleries of the nave have no supporting wall at the back excepting that next the campanile, but the arcades that carry the vaulting are comparatively short and resistance to any forward tendency is provided by the main piers. It may here be mentioned that the vaulting of the crypt was also delayed until the superstructure was finished.

You now see that in no part of the cathedral does the main structure depend on marble columns, and this arrangement will be appreciated by those who have experienced the uncertainty of getting large marble monoliths delivered by a stipulated time. The Byzantine builders had the advantage in this respect; their quarries were often the dismantled basilicas and temples of the Romans, where they found columns ready to hand. But the primary objects in delaying the subsidiary parts of a building are, as you know, to give the main parts time to find their permanent settlement, and to avoid interference with the scaffolding and exposure to the weather. The accumulation of rain-water in the pockets of the upper vaulting of the cathedral was sometimes a great nuisance, and holes had to be left in the brickwork for temporary shoots or spouting. During the very hot weather, when the domes were being turned, they were sprinkled with water to prevent the concrete setting too quickly.

(To be concluded.)

WEST RIDING SECONDARY SCHOOLS.

IN view of the extraordinary interest which has been aroused in the proposal of the West Riding County Council to levy a rate of 3d. in the pound for higher education, it is interesting to know, says the *Yorkshire Post*, that the authorities are now committed to an expenditure of over a quarter of a million on secondary schools alone. The precise figure is 276,630*l.* Of this huge sum 30,321*l.* is to go in sites, 227,959*l.* in buildings and 18,350*l.* in equipment. To the cost of sites and buildings the County Council make grants of one-third and pay half the cost of equipping the schools, but of course most of the money has to come out of the local rates. Eighteen entirely new

schools are being erected in the West Riding, nine of them being for girls and the remainder for both boys and girls. All told they will provide accommodation for nearly 4,000 children. The largest is the proposed new high school for girls at Barnsley, to accommodate 400. The site is to cost 2,373*l.*, the buildings 14,000*l.* and the equipment 2,000*l.*, or a total of 18,373*l.*

Other new schools, either built or proposed, and their cost may be set out in tabular form:—

Name.	Accommodation.	Site.	Estimated Cost.		
			Buildings.	Equipment.	Total.
		£	£	£	£
Barnsley High (Girls)	400	2,373	14,000	2,000	18,373
Brighouse Secondary (Girls)	150	3,022	6,750	1,200	10,972
Castleford Secondary (Dual)	300	3,033	12,000	1,500	16,533
Doncaster Secondary (Girls)	300	—	12,000	—	12,000
Goole Secondary (Dual)	300	3,350	13,150	1,000	17,500
Guiseley Secondary (Dual)	200	3,900	8,000	1,000	12,900
Hebden Bridge Secondary (Mixed)	150	3,000	6,750	1,200	10,950
Mexborough Secondary (Dual)	300	2,265	10,000	1,500	13,765
Morley Secondary (Dual)	200	2,400	11,160	1,000	14,560
Normanton Secondary (Girls)	100	—	5,000	—	5,000
Pontefract Secondary (Girls)	200	2,000	8,000	1,000	11,000
Pudsey Secondary (Dual)	300	—	12,000	—	12,000
Ripon Secondary (Girls)	80	—	4,000	800	4,800
Selby Secondary (Girls)	80	1,220	5,000	650	6,870
Settle Secondary (Girls)	100	—	5,000	—	5,000
Sheffield District Secondary (Girls)	250	—	10,000	—	10,000
Sowerby Bridge Secondary (Dual)	250	2,750	10,000	1,250	14,000
Handsworth Secondary (Dual)	160	702	7,200	1,200	9,102

Four schools are to be rebuilt—the Barnsley Grammar, the Elland Secondary (dual), the Thorne Secondary (dual) and the Todmorden Secondary schools. The Barnsley school is to cost 8,000*l.*, Elland 6,750*l.*, Thorne 6,000*l.* and Todmorden 8,500*l.*, while for purposes of better equipment grants are being made of 750*l.* to Thorne and 1,000*l.* to Todmorden. Ten other schools, mostly of the grammar school type, are to be extended, and one—the Keighley Trade and Grammar school—acquired. The cost of these alterations may be thus set out:—

Name,	Estimated Cost.		
	Buildings.	Equipment.	Total.
	£	£	£
Batley Grammar	1,000	—	1,000
Bingley Grammar	3,960	—	3,960
Drax Grammar	5,289	—	5,289
Harrogate Secondary (Mixed)	7,000	—	7,000
Hippcrholme Grammar (Dual)	2,000	—	2,000
Holmfirth Secondary (Dual)	650	500	1,150
Mirfield Grammar (Dual)	3,600	—	3,600
Penistone Grammar (Dual)	1,200	—	1,200
Tadcaster Grammar Secondary (Dual)	3,000	—	3,000
Ossett Grammar (Dual)	4,600	800	5,400
Keighley Trade and Grammar	6,400	—	6,400

The above figures, which may be regarded as official, will serve a useful purpose in indicating to the districts concerned the money that is being spent, or is proposed to be spent, on their behalf. At the Local Government Board inquiry, held at Wakefield on Friday, complaint was made by numerous gentlemen, who were opposed to the increased rate, of a complete lack of information on this subject. The details given will no doubt afford them the opportunity of asking some pertinent questions when the inquiry is resumed next week. It may be mentioned that during the past year new secondary schools were opened at Castleford, Morley, Settle and Sheffield, making over twenty with those now in hand. The number of West Riding pupils in attendance at secondary schools upon which County Council grants are payable is said to be approximately 6,600, equivalent to 4½ per thousand of the population.

MELBOURNE TOWN HALL.

THE City Council of Melbourne recently invited competitive designs for the extension of the town hall buildings. Nineteen sets of drawings were received, and a board consisting of professional advisers and members of the Council was appointed to report upon the same. At a meeting of the Council on March 4 the memorandum of the board was received. It was therein stated that after very careful consideration the board had arrived at the unanimous decision to recommend that the first prize of 300*l.* be awarded to the author of design No. 13. The report was unanimously adopted, and the envelopes containing the

competitors' names were then opened. It was announced that the first prize had been awarded to Messrs. Grainger, Kennedy & Little, National Trustee Buildings, 123 Queen Street, Melbourne. It is anticipated that the cost of the work will amount to 60,000*l.*, and that operations will be commenced at an early date. Of the winners of the first prize, Mr. John H. Grainger, well known as the designer of Prince's Bridge, Melbourne, has successfully carried out many large structures in Victoria, and after nearly a ten years' tenure has resigned the position of chief Government architect, West Australia, returning to Victoria to resume his practice. Mr. Grainger is corresponding member of the Société Centrale des Architectes Français of Paris. Messrs. Kennedy and Little are both Fellows of the R.V.I.A. Mr. Philip A. Kennedy is the author of many important buildings in Bendigo, whilst he has just completed St. Vincent's Hospital in Melbourne. Mr. John Little has practised in Melbourne for twenty years. Apart from his reputation as an architect he has been for many years the hon. secretary of the Royal Victorian Institute of Architects, and is lecturer in building construction at the Working Men's College, Melbourne, and editor of the R.V.I.A. "Journal of Proceedings."

GENERAL.

Sir Thomas Drew, P.R.H.A., who has for the past three months had charge of the fine art section of the Irish National Exhibition, has, in consequence of pressure of private engagements, forwarded his resignation as president of the section to the executive committee.

A Party of Members of the Northern Architectural Association visited Sunderland on Saturday and were conducted over the offices of the Wear Commissioners, the police buildings and fire station, &c.

Lord Aldenham proposes to reconstruct the organ in St. Albans Cathedral. At present the organ occupies a position above the St. Cuthbert's screen separating the nave from the choir, and impedes the view from east to west. The instrument is to be enlarged, divided into two parts and inserted in the arches on the north and south about the screen. The work is estimated to cost nearly 3,000*l.*

Messrs. Davidson & Crakney, of Newcastle and Sunderland, have obtained the first and second prizes in the competition for two branch libraries in Sunderland.

The Jury of the Salon consists of the following members:—M. Pascal, president; MM. Daumet and Bernier vice-presidents; MM. Marcel and Louvet, secretaries MM. Blavette, Boeswillwald, Bonnier, Deglane, Nénot Normand, Sortais and Vaudremer.

An Exhibition of Paintings by Adolphe Monticelli was opened on Saturday in Paris. It will be closed on May 4. There are seventy-six examples showing all his different manners of execution.

A Special Committee of the Salford Town Council recommended the erection of a town hall at a cost of 100,000*l.* but there were only twenty-one votes in favour of the project while there were twenty-four opponents.

The Contract for the decoration of the British Museum reading-room has been placed in the hands of the firm of Waring & Gillow, Ltd., and it is hoped that the work will be completed well within the six months contemplated by the authorities of the Museum. The decoration will take 200,000 leaves of beaten gold, the painting 25 tons of white lead and will keep 200 men busy for several months.

The Local Government Board has sanctioned the application of the Ilford Urban Council for permission to erect a public hall at Seven Kings.

Mr. Daniel F. F. Barton, who was known as an amateur at whose cost a grand concert hall was erected in Geneva and presented to the city, has died at his villa on the shore of Lake Lemán.

The Architects in Dundee who signed the agreement not to submit plans for the new technical institute, "in view of the inadequate remuneration offered and other unsatisfactory conditions affecting the competition," are, says the *Dundee Advertiser*:—J. Donald Mills, president of the Institute; John T. Maclaren, vice-president; Thos. M. Capper, W. Fleming Wilkie, David L. Allan, Charles Mann, William Gaudie, Chas. G. Soutar—members of Council; Mil & Shepherd, James Maclaren & Sons, Thoms & Wilkie Blackadder & Allan, Leslie Ower, James Findlay, Johnstone & Baxter, James Foggie & Son, Jas. Sibbald, Richard Murray, McCulloch & Jamieson, R. Hunter, Henry Thomson, Alex. Lickely, Edward Tough, J. & F. Salmond, John Bruce & Sons, Wm. Forrest, James Lowe.

THE WEEK.

THE Council of the Royal Society of Antiquaries of Ireland have had a great number of applications from the Estates Commissioners for information respecting ancient monuments situate on estates about to be sold to the tenants, to which replies have been given. In nearly every case reported on the structure was considered by the Council to be worthy of preservation. They have had no information as to what further action was taken beyond what is to be gained from the Parliamentary report of the Estates Commissioners, from which the following extract is taken:—"Inspectors and surveyors are required to furnish in their reports particulars of any ancient or Mediæval structures or monuments, or the remains thereof, which may be on the holdings inspected, in order that the Commissioners may be in a position to consider the advisability of restoring them, pursuant to section 14, either in the Commissioners of Public Works or in the County Council. During the period from November 1, 1903, to March 31, 1906, the Commissioners were so informed of the existence of sixty-seven monuments or structures. Of these, the Commissioners of Public Works have consented to allow two to be vested in them; the County Council of Kildare, one; the County Council of Westmeath, one; and the County Council of Down, one. In twenty cases investigations as to whether the monuments or structures were worthy of preservation by the Commissioners of Public Works, or by the County Council, were not completed; and in the remaining cases the monuments or structures proved not to be sufficiently important to be reserved under section 14 of the Act." It would appear from the foregoing that a large number of these monuments have not been vested in either the County Council or Board of Public Works, and consequently they have become the property of the tenants. It is to be regretted that there is no provision made for the preservation of such objects, many of them being of the highest local and antiquarian interest, and it is to be feared the tenants will not have the means or inclination to preserve or protect them from injury.

RAILWAY companies having private Acts are supposed to be outside the operation of the London Building Acts. But cases will arise in which the immunity of the companies appears to be doubtful. One is now under consideration. At the Crystal Palace the South-Eastern and other railways possess land of which a portion was last year let for the erection of a local office. The London County Council had notice served for the demolition of the building on the ground that it contravened the general building line. The railway companies asked the Tribunal of Appeal to set aside the notice, claiming that the building was erected for purposes connected with railways. The contention is upheld by the Tribunal. The County Council then went to the High Court, where it was decided that the question was one for the Court and not for the Tribunal, and the case was remitted for rehearing. On Friday last the County Council applied before the Tribunal that the appeal should be dismissed, with costs, although the case is still pending. That course was agreed to and the costs were fixed at 25 guineas. On an application of the Borough Council of Camberwell for their costs was rejected. At first sight it might be supposed that the Council have gained a victory. But the question has yet to be determined, for only at the stage in the operations has been accomplished. Eventually, it need hardly be said, the costs will amount much more than 25 guineas. At the same time, it is remarkable that the High Court should reserve for itself a question on a matter which, from the surveyor's point of view, is entirely technical.

AN inquiry was made in the last session concerning the remuneration of consulting engineers to the Crown Colonies and Protectorates for services in connection with the construction of railways during the last ten years. The object of the inquiry has not been clear to the Colonial Office, for railways may be intended not only for the commercial development of the territory, but also sometimes for a military or political purpose. The consulting engineers do not initiate the construction, and the money expended appears to be mainly out-of-pocket expenses. The colony of Sierra Leone has paid Messrs. BAKER & SHELFORD, in addition to their salary, sums of 2,363*l.* 11*s.* 4*d.*, 865*l.* 19*s.* 9*d.*, 3,194*l.* 19*s.* 11*d.*, 2,913*l.* 10*s.* 11*d.*, 116*l.* 2*s.* 5*d.* and 1,080*l.* 18*s.* 4*d.* From the Gold Coast Colony the expenses paid were 4,835*l.* 19*s.* 5*d.*, 6,135*l.* 16*s.* 2*d.* and 249*l.* 13*s.* 8*d.* From Southern Nigeria sums of 4,952*l.*, 3,265*l.* and 2,514*l.* 15*s.* were paid, and from Cyprus 2,645*l.* 13*s.* 2*d.* Messrs. GREGORY, EYLES & WARING received for office expenses from Ceylon 4,456*l.* 15*s.* 9*d.*, and from the Malay States 4,242*l.*, in addition to salary. The Straits Settlements paid 1,974*l.* 4*s.* 6*d.*, Trinidad 586*l.* 5*s.*, and British Central Africa 5,187*l.* 7*s.* 9*d.* It is stated that the latter sum includes, in addition to office and other expenses in this country, the cost of the consulting engineers' representative in the Protectorate and of his staff and office, travelling and other expenses, including passages, camp equipage, &c. In addition to a salary of 1,000*l.* the firm of Sir JOHN WOLFE BARRY & PARTNERS received last year 623*l.* 2*s.* 9*d.* for office expenses. Messrs. RENDEL & ROBERTSON were paid 3,695*l.* 18*s.* 11*d.* for office expenses by the Protectorate of Uganda. It is not improbable that the subject of consulting engineers will come under discussion at the Colonial Conference which is now sitting.

THE exhibition of the works of the German artists known as the Berlin Secession, which corresponds with one of the French salons, is now open to visitors. It has been decided to close it on August 1, which is earlier than is usual. It is believed that in July people think of the country and there is always a decline in the number of visitors to exhibitions. Berlin, moreover, is not exactly the place on a hot day to attract visitors from a distance. The experiment may not be successful, for the Germans are fond of adhering to old ways, and if they do not care to visit galleries they like to know they are open to receive them. Apparently the exhibition this year is above the average in quality, for among the secessionists are most of the representatives of new theories of art.

GRASSE is famous for its perfumes, and who knows whether the supplies of varied flowers which were necessary to produce them were not without their effect on the mind of the young JEAN FRAGONARD, who was born in the town in 1732? His paintings are at least suggestive of beauty which does not endure, as preferably he painted youth and its weaknesses in many forms. For an artist of his disposition the monumental works he had to study in Rome as a holder of the Prix were hindrances rather than aids. He knew his strength as well as shortcomings when he declined to become an Academician, although he went through the formalities which would be sufficient to qualify any other painter. For several years he suited French taste, but when the Revolution was impending the amateurs professed to believe in severity, and the joyous FRAGONARD was supplanted by DAVID and his mock-heroics. He died in Paris poor and neglected in 1806. Recently a memorial of the artist was unveiled in the Place du Jeu-de-Ballon in Grasse. It is the work of M. AUGUSTE MAILLARD, the sculptor. At the banquet there were orations about the painter who so well interpreted the French spirit in its last joyous days, and who was the rival of WATTEAU, CHARDIN and GREUZE.

UNITY AND VARIETY.

THERE must be a weakness in human nature for formulæ. They may be only a development of proverbs. Just as the essence of prudence is supposed to be expressed in two or three words, it may have been concluded that the results of experience and experiment could be presented by algebraic symbols. Formulæ are now esteemed as if they were charms by some men who consider themselves to be practical. A little multiplication and division and something is ascertained which otherwise could not be discovered without several hours' labour, if at all. The acceptance of "unity and variety" as the principle which underlies all beauty, and therefore all art, could not have gained such universal respect if men were not prone to believe that the briefest expression of wisdom was likely to be the truest in aesthetics.

It is impossible to say where it originated. We believe that at first it was intended to apply only to literary compositions and discourses. In such exercises there is a temptation to be discursive, and the counsel is often repeated of old orators who recommend enthusiastic tyros to omit everything that seems to be particularly grand. The phrase "thread of a discourse" could not have originated if writers and speakers were not apt to forsake the highway for the more pleasant byways. But as it is supposed that the rules which are applicable to rhetoric will also serve for the fine arts, it could not be long before architects and painters, if not sculptors, were induced to believe it was only necessary to combine variety with unity in order to produce satisfactory work.

It is always well when dealing with words to consider their origin. It is possible that the originator of the phrase signified by unity and variety certain ideas which were outside the province of art. The great St. AUGUSTINE is believed to have written a masterpiece on the subject. But it no longer exists, and the only references to it which have survived appear to relate to unity as a characteristic of spiritual beauty, "Omnis porro pulchritudinis forma unitas est." It would, however, be difficult to apply advice concerning mysticism to the creation of forms for giving pleasure to the eyes, which is the aim of most arts.

We all know that the same material things can be arranged in different categories. We can consider stones according to their colour or general appearance, or according to their strength, the difficulty of obtaining them and so on. It would, for example, be possible to erect a wall in courses which differed in colour and in texture. Variety would then be presented before us and there would be unity, for all the stones served one purpose in common. But it would not follow that the variety and unity had produced a beautiful object, for the stones might not be adapted for neighbourhood. Probably a wall more pleasing to the sight would be obtained by a combination of stones of the same formation, and which could not be supposed to display any variety. A similar result would, of course, be attained by using bricks of different colours.

A variety of forms can also be combined in a structure, and the result will not be necessarily either beautiful or a work of art. It must not be supposed that the failure is to be attributed entirely to prejudices on the part of the observer. Freakish combinations have been condemned at least from the time of HORACE. But it sometimes happens that through the power of association over us excuses will be found for those who perpetrated them. As a rule critics would condemn, for example, the employment of Gothic with Classic or Renaissance forms in a building. But we know that at the present time restorers who separated one from the other in churches are condemned as wanting in good taste, reverence and recognition of historic effects. In spite of this there is little doubt that the introduction of many forms for the sake of variety is generally allowed to produce an incongruous result.

It must be admitted that the temptation to introduce variety both in pictures and buildings is difficult to resist. It is only necessary to observe the conduct of children in an exhibition or with illustrated books before them in order to realise their eagerness for novelties. Men in respect of art resemble children. Originally they had to be satisfied with the simple forms. An important place probably for worship was at Carnac in Brittany or Stonehenge, consisting of so many similar avenues, we must suppose that strangers who attended were puzzled unless they were followed by official guides. There may have been decorations with flowers or the remains of victims which served as clues instead of enamelled tablets or sign-posts, looking at the rows of stones we are forced to conclude that unity and monotony are akin. The early temples were simple and the primitive statues of the Greeks were little more than blocks of stone and wood. Variety, in fact, became compulsory, if it were only to help men in distinguishing between objects. A line on a menhir placed at the beginning of a row of stones at Carnac would distinguish one avenue from another. In Greek sculpture a few folds to indicate a robe, or it may be a girdle, helped to suggest a god or goddess. In that way the variety which is essential to a work of art would originate in practical needs.

After a time variety would be adopted simply for the purpose of giving pleasure. A Doric column was not strengthened by fluting; rather by the diminution of material it might be supposed to increase the likelihood of failure. The sculpture of the metopes and pediments were novel varieties, and to the eye and mind of the Greeks imparted greater unity to a building than we can imagine. Variety in another form was obtained when Caryatides were substituted for columns. Colouring in masonry was likewise an innovation. It would have been possible to have effected changes which could still be called varieties, but which would not have increased the beauty of the buildings. The attempts of ambitious men to surpass the Greeks is proof of this. The progress of architecture did not arise from mere alteration or mere accretions, but from all the changes increasing the beauty of the building. To assert that beauty in architecture consists of unity with variety is to disregard the most important factor, which was beauty, and which would satisfy departure from established forms. We may in fact say that the formula under consideration, if taken literally, means that beauty consists in the combination of things which are not beautiful so long as they differ from each other. It is only a metaphysician who could suppose that such a conclusion was of any advantage to the world.

There is no doubt the formula has done harm. It has made some men believe that variety was in itself the most desirable quality in a work of art. During many centuries the difference between architecture as practised by the Greeks and that created by the Romans arose mainly from the importance attached to variety. Where marble was available there was a superabundance of columns. Could men be quickly trained as sculptors, then statues and reliefs were employed in profusion. Mosaics seemed to be indispensable to all those who traded with towns where they were produced. The buildings in which there was such a display of wealth are supposed to represent the triumph of craftsmanship if not of art. But the great fact remains that with all these excesses they could be accepted as showing the power of variety in unity.

We may interpret unity as a severe standard, such as was exemplified by the Greek mind when at its best, with a scorn of the superfluous such as was manifested in the Parthenon. But unity can become wonderfully elastic in order to comprise varieties of good and bad, suitable and unsuitable. If richness is tolerated in one part of a building there is no reason to prevent it appearing in other parts, and by that means the whole will be in keeping. MILTON did not hesitate to adopt

Doric type for the Parliament-house of the Fallen angels. According to him it was—

Built like a temple, where pilasters round
Were set, and Doric pillars overlaid
With golden architrave; nor did there want
Cornice or frieze with bossy sculptures graven;
The roof was fretted gold.

In this case we have varieties on a gorgeous scale, and many a Roman consul and emperor would consider that similar additions were improvements on the classic Doric. Indeed, it may be remarked in passing that MILTON considered there was a connection between the fabric he described and the Greek temples, for he tells us that MULCIBER, the architect of it, was adored in ancient Greece. Indeed, when men seek after variety they will paint the lily and gild refined gold for the sake of it; they are likely to be led into much that is extravagant and foolish.

It is not by formulæ the true artist works, whether painter or architect, and his productions are of a nature which cannot be defined with brevity or by algebra. There is a law to himself, and he is just as likely to make his mistakes as any metaphysician when he attempts the impossible. MICHEL ANGELO was not happy in expressing himself when he said that beauty was no more than the purgation of superfluities. What is more essential than the discovery of the figure which has to be emancipated by removing the marble which enshrouds it. His definition would be more worthy of a sculptor's journeyman, who in a mechanical way wrought the marble block into more or less resemblance to the model. It is the business of the architect as well as the sculptor first to shadow forth in his own mind the entity which is to rule his building as a whole. That being determined, he can adopt varieties to the extent which will be in keeping with it. He has to establish a series of relations between all the parts. But if he were to depend for character on the number of varieties which his building would present it might be considered as complying with the formula of which we have been speaking. But it would hardly be accepted as a work of art.

NEW BOOKS.

THE latest volume of the London Topographical Record (London Topographical Society) contains a description of Vanbrugh House and Vanbrugh Castle, Blackheath, by Mr. G. H. LOVEGROVE. The former has been removed, the latter is undergoing extensive alterations. The gateway to the castle must have made people imagine that the building was of large size. But neither the house nor the castle could be considered as imposing. The house, after undergoing alterations, was used for a ladies' school. The castle is described as the best of VANBRUGH'S small brick houses. But his massive style was better adapted to the design of large mansions. Mr. PHILIP NORMAN'S address is mainly devoted to the remains of the Roman wall of London. Another instalment is given of Mr. HILTON PRICE'S record of the "Signs of Old London," and reproductions are shown of old bills, trade cards and advertisements. The information is often very strange. For instance, in connection with the Crown in Cheapside it is said:—"In the reign of EDWARD IV. WALTER WALKER, dwelling at the sign of the Crown, in Cheapside, told his little child, if he would be quiet, he would make him heir to the Crown. For this innocent speech the unfortunate man appears to have suffered the extreme penalty of the law for high treason." The Mermaid tavern stood between Bread Street and Friday Street and the first mention of it is in 1462. According to tradition Sir CHRISTOPHER WREN lived in a house built on the site of the Saracen's Head, Cheapside, during the erection of St. Paul's Cathedral. In 1707 WILLIAM SQUIRE, at the Three Tents and Lamb, in Theoultry, announced that he sold great variety of paper hangings of his own manufacture at most reasonable

rates. JOHN MILTON, scrivener, the father of the poet, lived at the Spread Eagle, in Bread Street, in 1602. The catalogue of the maps, views and plans of London, exhibited at Drapers' Hall, will also be useful to archaeologists. The Society has already done valuable work, although there are only about two hundred subscribers. With an increase of funds there is little doubt that a record would be prepared of whatever has survived concerning Old Time London.

The use of squared paper has increased to a surprising extent of late. The result is that a quire can now be obtained for about the same price which a sheet cost several years ago. It has been popularised by the newspapers when indicating the rise and fall of temperature, imports and exports, prices of materials, &c. In such cases the lines are zigzag. But when dealing with such a subject as the strength of materials it is possible not only to demonstrate the regularity of physical laws, but to use the records as guides to the dimensions of the beams which will serve our purpose. Sticklers for scientific investigations may consider that such a use is of the empiric kind. But if time and trouble are economised and the risk of errors avoided then the squared paper method merits to be recommended. In the "Graphical Handbook of Reinforced Concrete Design" (CROSBY LOCKWOOD & SON), by Mr. JOHN HAWKESWORTH, an American engineer, fifteen plates are made to serve instead of calculations for finding the sections of beams and columns. They are adapted no doubt to American conditions, and more especially to the building code of New York City. But they will also serve in other places. The plates are copied from those employed by the author, and he believes they would be useful to architects who have only occasionally to design work in reinforced concrete and who may not have the organisation necessary to arrive at results by calculation. As a general rule, before using such aids it is well to test them by comparing them with approved results. For a stress may not in all cases be exactly represented by a straight line which always is at the same angle with the horizontal base. Occasionally curved lines come nearer the truth, and they are recognised in the plates. The requirements of the New York building code are given, and the author shows applications to a variety of instances.

A volume of reasonable size, entitled "Concrete-Steel: a Treatise on the Theory and Practice of Reinforced Concrete Construction," by Mr. W. NOBLE TWELVETREES (London: WHITTAKER & Co.), is well adapted to explain the latest form of construction. It describes several of the systems, and explains different theories which have been presented mainly by foreign experimenters. Owing to a number of obstacles, it is hardly possible at the present time to write a treatise on the subject which would be confined solely to English experience. The pages are adapted to inform students and others about what has been accomplished, and may serve as an incentive to English architects, engineers and contractors to devise improvements. Reinforced concrete serves expedition more perfectly than is possible with other materials, and if it were not for the conservatism of local authorities it would be largely used throughout the country.

Mr. H. C. STANDAGE, of Birmingham, is a chemist who has done much towards initiating people into the applications of chemistry to business purposes. His "Agglutinants of all Kinds for all Purposes" (A. CONSTABLE & Co.) is another effort. According to Dr. JOHNSON, the verb agglutinate was appropriated solely by medicine in his time. But it is shown in the book that men in various businesses, from architects to zinc-workers, possess an interest in cements, mortars, glues, and other aids for making one substance adhere to another. Mr. STANDAGE gives over 500 recipes, and his book contains much advice in other forms. Gesso, we find, corresponds with what is

commonly called gypsum in England and stucco in Scotland. Terra-alba is another name for a material that is largely employed in the arts as plaster of Paris and for adulterating other materials. Hints like the following meet us on almost every page:—"Colour alone cannot determine the quality of plaster, as the quality of the gypsum regulates the quality of the plaster. The whitest and hardest generally yields the best plaster, but as the exception proves the rule, it may be mentioned that Cumberland plasters are of a delicate pink and of a very pale grain and exceedingly slimy when gauged." The recipes are so widely applicable, Mr. STANDAGE'S volume should be at hand in any place of business where joints have to be made by means of chemistry rather than by mechanics.

Messrs. CONSTABLE also have published an American book on a similar subject, viz. "Glues and Gelatine: a Practical Treatise on the Methods of Testing and Use," by Mr. R. LIVINGSTONE FERNBACH, chemical expert. It is not so comprehensive as the companion volume, but glue is, however, taken in a wide sense, and those who use that material will be repaid by reading the pages. No builder will be surprised to learn that, "while Germany produces glues in far greater variety than other European countries, her product is, as a rule, inferior in quality." The extra superior is frequently inferior to the superior. Cologne glue can no longer be trusted. French glues, on the other hand, uphold their old character for purity and strength. The following will suggest the manner in which information is conveyed by the author:—

1. Glue exerts a far greater hold on surfaces of wood that have been cut across the grain than on those that have been split or cut with the grain.
2. When two surfaces of split wood are laid together the hold of the glue is the same, whether the fibres are laid parallel or crosswise to one another.
3. The value of a wood joint is dependent upon the union of the glue with the fibre of the wood. For glue to be properly effective it must penetrate the pores of the wood, and the greater this penetration the more substantial the joint.
4. All other factors being equal, glues that dry slowly are invariably stronger in the joint than those that dry rapidly.
5. Except in the case of veneering, both surfaces of the wood should be properly glued before junction.
6. Do not use thick solutions of glue for jointwork. They congeal too quickly, and hence fail to penetrate the pores of the wood, yielding, as a result, a weak joint. In every case the glue must be worked well into the wood with a brush, much in the same manner as a coat of paint is applied.
7. If glue is applied to hot wood all the water of the glue-solution will be absorbed by the wood, leaving a thin adhesive coating of glue at the surface of the joint, which, if made in this fashion, will hold only a limited time.

Mr. FERNBACH'S volume is an excellent example of the American treatise. Any circumstance that is likely to be useful is recognised, and it is assumed that the reader is a novice. An effort is made to have principles recognised, and although the author does not profess to enter into details of manufacture, he describes as much of the process as is needful for a consumer to understand.

The majority of people in this country who know anything about Madagascar are likely to be indebted for their information to some of the writings of the Rev. JAMES SIBREE, a missionary of the L.M.S. His "Madagascar before the Conquest" (T. FISHER UNWIN) represents over thirty years acquaintance with the island. Henceforth a different condition of affairs will have to be chronicled. It is well, therefore, to put on record as many facts as are possible relating to the island in which so many ancient practices were observed. New theories about life in a remote age depend for their support on evidence which is to be collected in places which have not advanced in the same ratio as Europe. The people of Madagascar have had peculiarities in their folklore, superstitions, manners and customs, and beliefs. Although they could

not be considered as exemplifying so much art ability as the cave-dwellers of Europe in a remote yet they made some attempts to produce symbols to adorn their houses and graves and some of their utensils. After seeing the examples of primitive art in the Rivers collection at Oxford, Mr. SIBREE says "the something very surprising in the almost total absence of ornamental art amongst the Hovas and some of the peoples inhabiting Madagascar. A tribe occupying the southern central highlands, known as the Betsileo, are to be an exception. For they have a decided and special style of ornament which they use for household utensils and tattooing is very common. But the author saw examples while travelling through the district in 1876, and it does not appear that any European has described the ornament. The French will probably be long before they reveal it to the world. Although art may not be remarkable, there is much else which will be found interesting by the anthropologist. Mr. SIBREE, having the true missionary spirit, has affection for the people, or at least the Christians among them. During the period of persecution between 1810 and 1861 they were punished by having to work on Sundays, as well as week days, in erecting mense workshops which an able Frenchman, M. LABORDE, had designed. One of those had walls 6 feet thick, and the native Christians had to quarry stone as well as to lay it. The capital, Antananarivo, in 1863, when the author first visited it, consisted of houses in which wood and rush or bamboo were alone used; stone and clay were prohibited. At that instance of two representatives of the L.M.S. sun-dried brick and tiles were substituted, and the many memorial churches designed by Mr. SIBREE demonstrated to the natives what was possible in building without importing foreign materials. Now brick is almost generally used. The book is written in excellent style, and it is free from the goody-goody representations which restrict books by missionaries to a limited class of readers.

A third edition of "Architectural Hygiene," Messrs. B. F. FLETCHER & H. P. FLETCHER, has appeared (WHITTAKER & Co.). It has been brought up to date, and as it contains over 300 diagrams, applications of all kinds are represented. Attention is given to planning, and the book merits the success it has gained in the course of a very few years.

GERMAN IRONWORK.

IT was fortunate that South Kensington was enriched with so many examples of wrought-ironwork, for of late years specimens are becoming more rare and therefore more costly. Examples of craftsmanship in the precious metals were preserved on account of the material. But a long period old iron was a sort of byword, and pieces which would now be highly prized were cast aside as worthless.

Ironwork is interesting, for it reveals that the smiths had pride in their tasks, and could produce work which may now be considered as artistic. The substitution of cast-iron for hammered and pierced work brought about what was almost scepticism concerning the beauty of ancient productions. The Gothic Revival was not without its influence against the more modern system, and although cast-iron work could not be superseded, it lost much of its importance by comparison with work that was entirely produced by the hand. In the best period the smith, like other craftsmen, could not fail to draw inspiration from architecture. We sometimes see not only trefoils and quatrefoils, but miniature pointed arches. We might suppose in looking at some examples of wrought-iron that, like the goldsmiths of later time in Spain, the smiths were not without some influence on the architects and carvers. Many of the flamboyant curves which seem unsuited for stone appear to be derived from the flexible forms to which iron lent itself in the hands of artificers.

An excellent collection of Germanic ironwork belongs to Herr F. Geiger, a Bavarian, is now on view at the gallery of the Fine Art Society in New Bond Street. It is mainly of a domestic kind; door furniture evidently is

IRONWORK FOR DOORS AND CHESTS (EIGHTEENTH CENTURY).

ESCUTCHEON.

GRATING OR DOOR (SIXTEENTH CENTURY).

DOOR HANDLE (FIFTEENTH CENTURY).

favourite with the collector. We give illustrations of a few examples which are suggestive of work in gold and silver rather than in wrought-iron. Some, it will be seen, are platework, but others are hammerwork and *repoussé* work. It would be an advantage if some or all of the examples could be procured for the industrial museums in this country, and they are therefore well deserving of attention from committees and others desirous to see an advance in metalwork.

SOCIETY OF ARCHITECTS.

THE twenty-third annual dinner of the Society of Architects was held on Thursday evening, the 18th inst., at De Keyser's Royal Hotel, Mr. Albert E. Pridmore, president, in the chair. The Lord Mayor and Sheriffs Crosby and Dunn attended in semi-state, and among the guests were Lord Monkswell, Sir Benjamin Stone, M.P., His Honour Judge Rentoul, Mr. T. B. Silcock, M.P., Captain the Hon. Fitzroy Hemphill, Mr. H. G. Montgomery, M.P., Mr. Atherley-Jones, K.C., M.P., Mr. A. C. Scovell, J.P. (chairman Metropolitan Asylums Board), Mr. Wm. Robertson (master of the Carpenters' Company), Mr. Matthew Wallace, J.P., Mr. C. F. Parslow (master of the Painters' Company), Mr. J. S. Fletcher, M.P., Mr. A. C. Morton, M.P., Mr. Brook, Mr. T. Kitchin, Mr. Donald Maclean, M.P., Prof. R. Elsey-Smith, Mr. Alfred R. Smith (master of the Tylers and Bricklayers' Company), Sir H. Trueman Wood, Mr. E. Holmes, Mr. A. A. Hudson, Mr. G. L. Gomme, the mayors of Bath, Stoke Newington, Holborn, Chatham, Chelsea, Islington and Mansfield; Messrs. W. E. Riley, James Bell, Harry Bird, T. A. Bullock, J. Patten Barber, E. C. Thrupp, F. L. Dove, Alfred J. Gate, E. O. Sachs, F. Wallen, E. W. Harvey Piper, W. A. Scott, Reuben Sheppard, J. B. Wild, George Langridge, E. R. Woodward, G. A. Birkenhead, H. C. W. Blyth, J. Llewellyn Smith, C. S. Thomas, P. H. Ashby Bailey, W. Scott-Deakin, John Harrop White, R. Frank Vallance (vice-president), J. B. Corby, Edgar M. Leest, J.P., E. Basset Willis, W. B. Willmott, G. H. Leavey, Charles Day, Councillor Whyman, Alderman Driver, G. E. Bond, Anthony Scott, Colman Scott, T. J. Byrne, R. G. Bafe, Alderman Viney, Alderman Skinner, Alderman Featherby, Geo. H. Paine, J. G. C. Adams, T. T. Blyth, Frank Havern, F. W. Fenning, R. Leighton, J. R. Ross, H. Weber Brown, W. Atkinson, Percy B. Tubbs, Leonard Tubbs, M.A., Herbert W. Matthews, R. Harvey Barton, Geo. H. Bailey, C. Goldfinch, Geo. W. Pridmore, W. Bates, R. Banks-Martin, A. H. Campbell, C. Palmer, Charles H. Champness, B. R. Tucker, Ernest Beal, H. P. Barrett, C. H. Mead, A. R. Robertson, E. H. Adams, J. H. Arber, M. J. Zimmermann, Sidney Marsland, Wm. Woodward, Ellis Marsland (hon. secretary), Montague L. P. Crozier, T. E. Lidiard James, Col. F. S. Leslie, R.E., Cholton James, Nai Tom, David Morgan, G. Foord, Walter C. Williams, E. C. Beaumont, Wilfred H. Robinson, Oswald C. Wylson, Charles E. Jackson, Chas. E. Denny, Chas. Watkins, B. Wilson, Walter W. Thomas, J.P. (past president), J. Geo. Robins, J. F. B. Cockrell, S. Everard Davies, D. A. Langdon, Edwin J. Sadgrove, J. A. King, P. A. Coad, Owen Owen, A. A. Atkins, W. E. Wanmer, E. P. Atkins, F. L. Fitness, R. Emerson, H. V. Milnes-Emerison, E. H. Wilkins, E. J. Naldrett, G. A. T. Middleton (vice-president), and C. McArthur Butler (secretary).

The loyal toasts were followed by that of "The Houses of Parliament," proposed by Mr. Deputy Wallace, C.C. Lord Monkswell responded for the Upper House and Mr. T. B. Silcock, M.P., for the Commons.

His Honour Judge RENTOUL gave the next toast, "The Local Authorities," and said he must first and foremost submit the Corporation of London as a body that was the admiration of all, and his best advice to the London County Council was that it should model itself on the Corporation. Referring to the most recent building erected by the Corporation, His Honour complained that though the new Sessions House was a beautiful edifice and splendid to look upon, the acoustic properties in some of the courts were rather embarrassing to the Judge and those who attended there. He hoped that it was within the range of architecture to improve such a defect. He was sure the citizens of London could well be proud of the Corporation and the County Council, and, in spite of many things which they had read in papers, he believed all were of opinion that the local authorities in this country did their work very well, though they got little credit for it.

Alderman and Sheriff CROSBY replied for the Lord Mayor, who had left to attend another engagement. In the

course of his speech he alluded to the remarks made by Judge Rentoul about the acoustics of the Old Bailey. He did not know the peculiarities of Court No. 4, but his own experience in Court No. 1 was different, for he had not heard any duplicating of sound there, and business could be conducted satisfactorily. Any such defect in the courts would be an accident, and he had yet to learn, he said, that an architect could know before his design was built that it would be true in acoustics, as a true principle in the science could not be defined.

Captain the Hon. FITZROY HEMPHILL responded for the London County Council, and remarked that the aim of the architectural profession and the Council was similar, for both desired to improve the conditions of the people by good building. He felt there was a bond of sympathy between the Society and the Council, inasmuch as the Society had done such good work in raising the status of architects by examination throughout the country, and those members of the Council who had worked hard to improve London were grateful to the profession of architecture. But great responsibility would rest in the future upon architects. During the next fifty years the profession would have opportunities of building and rebuilding probably the two greatest thoroughfares in the world; he referred to Regent Street and Kingsway. The criticisms levelled against Mr. Norman Shaw's magnificent designs he hoped would not be listened to. They were without justification, for even in the lineal area of glass in the new shop fronts in Regent Street there would be 5 feet more space than there was before. Another point, and one in which he sought the support of architects, was in regard to the elevations of the buildings in Kingsway, which should make London the most beautiful city in the world. The speaker also referred to the proposed new county hall and said he did not believe that the architects in England were not able to compete against any foreigner in designing such a building.

The Mayor of BATH also responded to the toast, and cordially invited the members of the Society to Bath when they visited the West of England in the summer excursions.

Mr. ATHERLEY-JONES, K.C., M.P., proposed "The Society of Architects." He said there was no profession more worthy of admiration than that of architecture, which combined the highest and the noblest conception of true utilitarianism in a combination of the beautiful and the useful. It was the object of the Society to uphold that ideal and improve the status of the profession, and with that high purpose the Society had promoted a Registration Bill in Parliament. Unfortunately the Bill had not gone through, but he trusted that the Society would continue to work in the interests of the public, and press its measure until success was achieved. He wondered what the fate of the new building would be which the County Council proposed to erect on the border of the Thames, and expressed the hope that the new party would not display any parsimony in the undertaking. In conclusion, the speaker urged the members to still strive to rouse the Legislature to the need for architectural registration, and induce the kindred Society, the Institute, to enter into generous rivalry with them in order that they might secure the passage of the measure.

The PRESIDENT, returning thanks for the reception accorded to the toast, said it was twenty-three years since a small body of architects banded themselves together mainly with a view of promoting a Bill in Parliament to secure the statutory registration of architects. That was the birth, as it were, of their Society, which had reached maturity, and which included in its ranks nearly 900 gentlemen practising the profession of architecture, not only in the United Kingdom, but in practically every part of the Empire. The Society was increasing in numbers daily, and extending its scope and influence. Only last year a branch was established in South Africa, and although in its infancy had done much to promote the influence of the Society in that part of His Majesty's dominions, and examination centres had been formed at Cape Town, Johannesburg and other localities. A gratifying feature of the last few years was the large number of young men who had become affiliated to the Society in the students' section, and had availed themselves of the opportunities afforded them of entering for various studentships and scholarships offered by the Council. The Council were considering a comprehensive scheme of architectural education, which it was anticipated would be of the greatest advantage to students, particularly those who were unable to participate in the advantages available to metropolitan students. All that pointed to the fact that the Society was fulfilling the objects for which it was founded, viz. the statutory education and registration of

architects. Never since its foundation had the Society ever deviated from the path which it then marked out. It had persistently fought for the principle and had spent time and money in this direction and was doing so still. At the present time Mr. Atherley-Jones, to whom they were so much indebted for his efforts in the cause of registration, was awaiting a favourable opportunity to reintroduce the Bill into Parliament, and they were fortunate in having many friends who had promised their support to the measure. The reform was as necessary for the protection of the building public as the profession. So far as the actual progress of the Bill was concerned, there was nothing to report owing to the exigencies of Parliamentary procedure, which in the existing state of affairs reduced the chances of a private member's Bill to a minimum. In the meantime, however, their energies were directed to consolidate professional and public opinion on the principle, and they had the sympathy and approval of a large body of architects in different societies who were in favour of the Bill. The Society of Architects' Bill was not brought forward in any selfish manner, but desired the reform to apply equally to the whole of the profession. It would be absurd to suppose that any Bill which did not protect vested interests, and provide for the inclusion of every bona-fide architect, would have the least chance of being sanctioned by Parliament. At the International Congress of Architects last July the question of registration was discussed, a paper having been read on the subject by Mr. Robert Walker, one of their past presidents. Many foreign architects and men from distant parts of the Empire expressed their views and sympathy, and the following resolution, moved by Mr. Ellis Marsland, was carried with but two dissentients, "That it is desirable in the interests of the public of all nations, and of the profession of architecture, that all practitioners should have a statutory qualification." That showed the trend of public opinion. The President welcomed Mr. Montgomery, M.P., the organiser of the Building Trades Exhibition, opened recently by the Lord Mayor, and he reminded the gathering that in 1885 the Society organised a very successful Architectural and Building Exhibition in the Crystal Palace. Mr. Montgomery, he said, was to be congratulated on the success of the present exhibition, which was of great interest to all architects and persons engaged in the building trade, who were keenly interested in anything which enabled them to keep in touch with the latest improvements in building commodities and methods of construction. It was their custom to take one or two trips during the summer to places of architectural interest, and the Council had determined this year to visit the interesting county of Somerset. In anticipation of these excursions, he desired to convey the thanks of the Society to the Mayor of Bath for his offer to entertain the members when they visited that city. With regard to street improvements, the President hoped the County Council would see their way to dispose of the sites in that magnificent thoroughfare Kingsway, and that at no distant date handsome buildings would be erected thereon which would add to the beauty of the Metropolis and assist the reduction of rates. As regarded the alteration and rebuilding in Regent Street, he entirely agreed with Captain Hemphill. Art and commerce seemed to be at loggerheads, the shopkeepers asserting that the architects were sacrificing business considerations to architectural display. Time alone would prove this, but he hoped and believed their fears would not be realised. He was confident that the Society might look forward to an increased sphere of utility in the future, and that members could rely on the Council doing their utmost to promote the best interests of the profession.

The last toast submitted was "Our Visitors," proposed by Mr. G. A. T. Middleton, vice-president, and responded to by Sir Henry Trueman Wood and Mr. A. A. Hudson.

HUNTERIAN MUSEUM.

THE works committee have reported to the Glasgow University Court that they had considered a report by the Master of Works on the lighting of the Hunterian Museum, in which he pointed out that the lighting might be improved by admitting daylight by the sides of the roof or by electric lighting. It was resolved to recommend in the meantime that fourteen roof lights be placed in each of the side roofs over the galleries. These lights would in no way weaken the side roofs and they would not be visible from the outside. The estimated cost was 300*l.* It was

also resolved to recommend that six electric arc lamps be fitted up in the roof of the museum for general lighting at an estimated cost of 45*l.*

Dr. M'Vail said to place glass on the roof would entirely alter the architectural features of the north front, which was by far the handsomest front of the building. He thought they should take the opinion of an architect before proceeding to carry out any such scheme.

Professor Stewart said the point really was whether the alterations would spoil the building from the outside or the inside. They would not spoil it from the outside. It might be that they would spoil the shadows inside, but they wanted light and they must get it. If they could get daylight it was much cheaper than artificial light.

Dr. M'Vail moved that the opinion of an architect be taken, and after further discussion it was agreed to get the advice of Mr. Scott and Mr. Burnet before proceeding to carry out the works committee's scheme.

A SURVEYOR OF COUNTY BUILDINGS.

A JOINT sub-committee of the general purposes and education committees of the county of Cumberland have prepared a report on the duties and emoluments of the county architect, which they had had under their consideration. The report stated that they were of opinion:—
 "(1) That the ordinary repairs, alterations and maintenance of all county buildings, police stations and schools might with advantage be undertaken by one man, to be styled 'the surveyor of county buildings and schools,' and that the salary attached to the office be 300*l.* per annum and reasonable travelling expenses, the County Council providing the necessary clerical assistance at a cost not exceeding 100*l.* and an office, and also paying for such books, stationery, postages and telegrams as they consider requisite. (2) That the said surveyor be required to devote the whole of his time to the services of the county, and be responsible for the above-mentioned duties, and in addition that he prepare and submit plans, drawings, specifications and estimates, and take out quantities, obtain tenders, and carry out the execution of any new work which he may be required to do by the county property, the standing joint or the education committees, and all plans, specifications, &c., so prepared shall become the property of the county. (3) That he shall attend all meetings of the County Council and any committees which he may be requested so to do, and that he be required to keep and submit quarterly to the education and county property committees an account of his out-of-pocket expenses, such expenses to be charged respectively to the education committee or the County Council as the case may be; and that he also submit quarterly a requisition of such books, stationery, &c., as he may require during the ensuing quarter, and also keep a journal, in such form as may be required by the County Council and the education committee, showing the dates of his visits to county property and the extent of any repairs or alterations he found necessary. The present county architect receives a sum of 390*l.* per annum, and finds his own offices, clerks and office expenses, and the Education Clerk of Works receives a salary of 200*l.* a year, has an office at the Courts, and has about 50*l.* a year for travelling expenses as well as 65*l.* for a clerk; books, stationery, drawing paper and postages, &c., amounting to about 45*l.* a year, are also paid, making the total expenditure at present about 750*l.* Your sub-committee consider that if their proposal is adopted the future payments will be as follows:—
 The said surveyor to receive a salary of 300*l.* and 100*l.* per annum being paid for clerks; travelling expenses being about 80*l.* and stationery, books and other office expenditure estimated about 60*l.*, making a total of 540*l.* per annum."

The report was adopted.

Mr. G. H. Willoughby, F.R.I.B.A., the assessor for the fifty-four sets of competitive drawings submitted in connection with the Failsworth public library, has awarded the first place to Messrs. E. Ogden & P. C. Hoy, of Examiner Buildings, Manchester. The premiums offered were 20*l.* and 10*l.* for the designs placed first and second respectively, but on the recommendation of the assessor the District Council have decided to award premiums of 10*l.* each to the following competitors:—Frank W. Mee, Manchester; David Bird, Manchester, and Speir & Beavan, Cardiff.

NOTES AND COMMENTS.

THE designs for the proposed Scottish National Exhibition which will be held next year will have to be sent in by May 11. Premiums of 100*l.* will be given for the designs assigned first and second place by the assessor, Mr. J. J. BURNET, and one of 75*l.* for the third design. Competitors will be allowed to offer suggestions about the arrangement of the site in Saughton Park. The general scheme of what is to be provided is as follows:—(1) Buildings for general exhibits of an internal area of not less than 100,000 superficial feet, and for machinery and exhibits in motion of an internal area of not less than 20,000 superficial feet. This should include at least one restaurant and one tea-room as part of, but not necessarily inside, the main building. (2) A concert hall seated for 2,000 persons, with space for large orchestra and organ. These buildings may or may not be under one roof. (3) A fine arts building of not less than 1,500 lineal feet wall space. This building should be of simple plan, preferably fireproof, absolutely apart from the other buildings, and easily capable of extension to 2,000 lineal feet. (4) A permanent conservatory shelter, or winter garden, of an area of not less than 3,000 feet, must form part of the buildings, and in selecting the position of the permanent bandstand and the winter garden it should be kept in view that it is proposed that these erections should remain as features in the design of the public park which will be formed on the termination of the exhibition. It is proposed to have two entrances, one by the contemplated Corporation Bridge, over the Water of Leith, and the other from Balgreen Road. The total cost of the buildings mentioned in articles 1, 2, 3 and 4 is not to exceed, exclusive of electric light, gas, water, or other supply piping, the sum of 20,000*l.*

THE annual report of the National Art Collections Fund is a most satisfactory document, and it is surprising how many gifts have been offered to the National Gallery, the British Museum and the Victoria and Albert Museum. At the end of December there were 710 members and six honorary members. Owing to the circumlocutory procedure which must be gone through in this country before any object is purchased from the public funds, there is a risk of more nimble administrations carrying off prizes. There are two sub-committees of the Art Collections Fund; one for the purchase of pictures and the second for the purchase of works of other classes. Having so much power opportunities will not be neglected. Special contributions are received from members towards the acquisition of objects of unusual importance. The corresponding French society has a membership of 2,000 and an income of about 2,000*l.* The acquisitions are not necessarily confined to ancient works.

THERE are some things which do not support STERNE's theory about the superiority of what is done in France. Trade-mark registration is one. The annual report of the British Chamber of Commerce refers to a case which is offered as a warning to exporters. A well-known British manufacturing company shipped to its branch in France certain catalogues to be used in the sale of goods of their make, and containing an illustration of a character so common in England in connection with this class of goods that no house has ever attempted to register it. One of these catalogues came into the hands of a small French manufacturer, who promptly wrote to the firm issuing the catalogue, claiming that the illustration in question was an infringement of a mark which he had registered in France. His statement was found, on inquiry, to be correct, and the British manufacturer, whose good faith in the matter was undoubted,

agreed to discontinue the use of the illustration question rather than engage in litigation over advertisement which contained nothing essential to business. British manufacturers should obtain registration, or rather deposit, of their marks in France, and also ascertain whether they have not been anticipated by any competitor. According to French law, the deposit of a trade-mark is not attributive but declarative of ownership; the deposit establishes the date at which the claimant was using the mark, but his claim to sole ownership of the mark may be overthrown if it can be proved that such mark had been previously used in France. For example, had the British manufacturer above cited been able to prove that catalogues containing the illustration in question had circulated in France prior to the deposit of the illustration in France as trade-mark by the French claimant, the claim of the latter would have been set aside.

THE first NAPOLEON adopted several measures to celebrate his victories, and in that way painters and sculptors obtained many important commissions. He was not satisfied with statues, and he resolved to have the biggest vase in the world fashioned in marble as a field for the representation of his victories. He obtained three of the finest blocks which Italy could yield. But before they were handed over to the sculptor the French Empire collapsed. The Grand Duke of TUSCANY considered they would be an acceptable present for GEORGE IV., who, recognising the purpose for which they were originally intended, gave a commission to Sir RICHARD WESTMACOTT for a colossal Waterloo vase, and the marble would thus by one of the ironies of fortune be made to represent the downfall rather than the triumph of NAPOLEON. When the work was completed it was about 16 feet in height, the largest diameter was about 10 feet, and the weight was not less than 20 tons. When King WILLIAM IV. came to the throne the vase appeared to him to be a sort of white elephant in stone. The National Gallery, which was then a new institution, was considered a suitable depository for it, and in 1835, before WILKINS' building was completed, the vase was placed in the hall. It was soon recognised as a nuisance, for it was an obstacle to the ingress and egress of visitors; and besides, in days when iron or steel girders were not available, a dead weight of 20 tons on a confined area was fraught with danger. The opening of the South Kensington Museum afforded an opportunity which was seized. But it was even more dangerous in its new abode, and the resolute HENRY COLE had it taken to pieces and put out of sight. The trustees of the National Gallery were, however, in an official sense its possessors, and inquiries about the manner in which they discharged so onerous a trust were made from time to time. But the area of the National Gallery was more insufficient than before, and the dangerous gift was kept at a distance. Then the subject was brought under the consideration of the Office of Works, without avail. Finally, His MAJESTY, with his customary good nature graciously offered to allow the unfortunate vase to be set up in the grounds of Buckingham Palace, and there it is for the present at least.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Leonard Stokes, vice-president, in the chair.

Mr. ALEXANDER GRAHAM (hon. secretary) announced the decease of Frank Barlow Osborn, of Birmingham, elected Associate 1864, Fellow 1872; R. Creese Harrison, Associate 1882, Fellow 1889; and John Wardle Donald, of Southfields, elected Associate 1888.

M. A. W. WEISSMAN, of Amsterdam, read a paper on

Gallery Building.

In designing a museum, he said, the architect should keep in mind that it is essential to his success that the works of art for which the building is intended shall be perfectly safe in it, and can be shown to their best advantage. If the architect's chief concern is for the exterior to make a good first impression the museum will be a failure, as is the case with many continental galleries. Though the selection of a site is usually decided by the authorities alone, the actual position of the building and the grounds surrounding it need the architect's most careful consideration, especially with regard to protection from fire breaking out in neighbouring buildings, and the provision of the light best suited to pictures. Modern architects prefer the gallery-rooms lighted from the ceiling. On the Continent, as a rule, the gallery buildings have two or even more storeys: the pictures are in the upper rooms with skylights; the ground floor contains antiquities, sculpture, &c. The staircase leading to the upper storey affords a splendid opportunity for decorative treatment which would be out of place in the rooms, as the works of art themselves form a decoration which is better left to speak for itself. Visitors should be able to find their way with ease and not have to pass a second time through a room. There should be one entrance only. Dwellings are not desirable in museum buildings. Night attendants should be provided to make a circuit of the buildings at fixed intervals. It is desirable in buildings intended for temporary exhibitions to make provision for the pictures to be brought by lifts to the gallery-rooms. Well-lighted rooms for restoring and copying ought not to be omitted. Care should be taken to prevent the objects of art in a gallery suffering from dust, humidity, or sudden changes of temperature; exterior walls, therefore, should be made double. With regards heating, the best results are obtained by a low-pressure hot-water apparatus. This can be designed to meet all requirements, both as regards the temperature of the rooms and their ventilation. The air between the ceiling and the roof must not be shut up, and openings should be provided so that the air of the room can rise to the glass, and be exhausted there by ventilators. Gratings can be placed in the walls near the floor, where fresh air is obtained. The rooms can be lighted from the ceiling or by a window in a wall. Rooms lighted by the ceiling are suitable for large paintings of the Italian and Flemish schools; those of the Dutch school side-light is preferred. The author discussed the rules laid down by Magnus and his own system of measurement in order to find the right proportion of light space to floor space and to get the best result possible. He has found that a room is best if from 12 feet to 36 feet wide. Walls ought not to exceed 15 feet height. The opening in the ceiling is found to be best when half the floor surface of the room. To prevent the room being lighted too much, the upper part of the roof should not be glazed. If the dark space round the ceiling-lining is 5 feet wide, only the roof openings opposite can let the pictures, and the light from the openings at the side, which causes the annoying glimmering of the picture surfaces, is completely shut out. In a room with a height of 22 feet from the window is the limit where sufficient light can be obtained, and in such a room there should be one window. The glass-line should be 7 feet from the floor and the window run up to the ceiling. Rooms with a height of 20 feet should be 20 feet high and their length not exceed 100 feet.

A gallery-room should have restraint and repose, the colours should be quiet in design and colour, and the decoration be reduced to a minimum. The dado, which should be 3 feet high, should have a panelling of dark wood, left unpolished to prevent reflection on the mouldings. Instead of the ordinary picture-rods under the cornice a small moulding should be placed along the wall, into which hooks can be screwed and removed at will, or the lowermost moulding of the cornice may be so designed as to support the pictures.

The author went on to give some notes on important gallery buildings in Europe—that at Brunswick, built from 1883 to 1887 by Mr. Sommer; the gallery at Cassel (1871-7) by Mr. von Dehn Rothfelser, which stands unsurpassed; the Alte Museum at Berlin, built from 1825 to 1828 by Schinkel; the Kaiser Friedrich Museum, Berlin, built by Herr Ernst von Ihne; the National Gallery, London, spoilt architecturally by its low elevation, its insignificant dome and its pepper-box turret. Since the addition of the new wings and the central octagonal hall the author considers the interior arrangement of the National Gallery one of the best to be seen, and the lighting extremely well managed.

Having referred in more or less detail to Hertford House, the palatial home of the Wallace collection, the Alte Pinakothek and the Neue Pinakothek at Munich, Semper's famous Dresden gallery and the Hofmuseum at Vienna, the galleries at Brussels, Antwerp, and Mr. Cuyper's Ryksmuseum at Amsterdam, the author went on to describe the gallery buildings he has himself erected or designed. The City Museum at Amsterdam was built at a cost of 45,000*l.* from 1892 to 1895. As there was no architectural style peculiar to the nineteenth century, the building had to be suggested more or less by the fine art of the time when there existed a style of interest in Holland. This style he found in the Dutch Renaissance of the beginning of the seventeenth century. But he did not follow closely the examples set by former ages. In designing the details he went his own way, avoiding the copying of sculpture and of the curvature of mouldings from ancient examples. The central hall contains the principal staircase, which has a skylight with glass of a warm yellowish tone. Floors in the gallery-rooms are teak "parquet," the wood-work being oiled to show the beautiful grain. Originally the walls of the rooms were painted, but now canvas in warm tints, such as olive-green and deep red, has been put on them.

The author showed plans and gave a description of a house, which included a gallery-room, which he had erected for a gentleman possessing a valuable collection of modern Dutch and French pictures. Particulars were also given of a scheme for rehousing with greater safety the masterpieces of Franz Hals, which are now exhibited in the ancient town hall of Haarlem.

The paper was illustrated by a large number of plans and views of the various buildings described.

Sir L. ALMA-TADEMA, R.A., said art belonged to humanity, and architecture especially so, and it was therefore well to find a brother architect crossing the Channel to give his experiences in building. The paper which they had heard acquainted them with galleries on the Continent while they were spared the unpleasantness that was so often endured in crossing the sea. He for one had enjoyed the paper very much, and although in many ways he agreed with the lecturer, there were some points on which he differed. In the building of a museum there were two sides to be considered. One related to the architectural treatment and the other to the objects to be housed in the building. It was on this question that he differed with the lecturer, and he suggested that a museum should be adaptable for the exhibition of different objects. He reminded them that painters did not use top lights in their studios, for the reason that such lights cast shadows and hindered the artists in their work. The side-light was best; it was the light in which they saw nature and in which they passed their days. Pictures had their planes, and in a building erected for exhibiting them artists had a right to claim that the pictures should be seen under the most favourable conditions. Position was all important to the true effect of a painting, and Sir Laurence quoted an instance in which a picture painted for the town hall in Amsterdam was changed from its original position and the fine effect of the work spoiled. So, too, he said with Rembrandt's *Night Watch*, which was painted for a room with a side-light—the schutters' room. In order to reduce the risks from fire in museums, Sir Laurence would not allow the guardians of such buildings to have living accommodation on the premises, though there should be constant inspection during the day and night. Fireproof buildings began to be the fashion in the fifties, but in spite of all that was said in their favour, a museum constructed as fireproof for the province of Antwerp was burnt. In conclusion Sir Laurence said he was sincerely grateful for what he had heard in the lecture, and he asked the meeting to join with him in a hearty vote of thanks to their brother architect who came from the other side of the Channel.

Mr. J. D. CRACE seconded the motion. The paper, he said, had put before them some of the complicated problems which arose in the building of a picture gallery. If nothing else had been said but to lay stress on the fact that all pictures were not seen equally well by the same light, M. Weissman's journey would not have been taken in vain. There was a useful hint also in the suggestion that the difference of tone in pictures of varying styles should be maintained by suitable framing. In the pictures of the Dutch school, belonging to such a class as Teniers and Van Ostade, &c., the low tone of colour gained infinitely by the employment of a black frame, with a small amount of gold to separate the picture from the frame. One of the great charms of those works was the extraordinary knowledge they showed of interior and atmospheric perspective, which was carried to a height no other school ever attained. Regarding the floors of galleries, Mr. Crace said it must be within the memory of many of those present that Barry in the National Gallery introduced oak floors, with a white marble margin near the walls; but before two years had elapsed the marble was removed, owing to the objections against it as a reflecting surface.

Sir ASTON WEBB, R.A., said he found himself very much in agreement with many of the points in M. Weissman's paper. He thought painters were rather difficult to please in regard to picture galleries and the way in which their works should be seen, though he suggested architects should endeavour to bring together the various views expressed by painters as to the best way of exhibiting works of art. The paper had referred to the circulation of visitors in galleries, and the point was an important one, for Sir Aston Webb said it was rather tedious and annoying after having gone through galleries with an enormous number of even beautiful works, to be compelled to return the same way in order to leave the building.

Mr. H. H. Statham, Mr. Alfred East, A.R.A., and Mr. Reginald Blomfield, A.R.A., also supported the vote of thanks.

WESTMINSTER CATHEDRAL.*

(Concluded from last week.)

The Sanctuary Dome.

WE are now in a position to examine the eastern dome, that differs in several respects from those of the nave. Unlike the latter, that seem to rest on the flat roofing of the church, the dome of the sanctuary emerges gradually out of the substructure—the extrados of the pendentives forming a pyramidal series of offsets or steps that follow the plan of the dome. The reason for thus exposing the pendentives outside was to limit the height of the supporting walls on the north and south, so as to give greater elegance to the eastern turrets, and to bring this part of the building into closer harmony with the choir. To further this object the vaults over the organ galleries are also exposed, the whole group presenting a subtle gradation of parts more Oriental than the rest of the building, and perhaps more expressive of the internal arrangements. The abutment for the main supporting arches of the sanctuary dome is provided by the staircase turrets on the east and by the transept piers on the west, while for the dome itself abutment is provided on the north and south by the vaults over the organ galleries, on the west by the dome of the nave, and on the east by buttresses built on the wide supporting arch that forms part of the vaulting to the choir; these buttresses are stiffened by the outer wall of a passage-way that passes through them to provide communication between the staircase turrets. The circle developed by the pendentives is 52 feet in diameter. On the closely boarded centring for this dome other centring had to be constructed for the window openings, the reveals of which represent a series of counterforts all round the dome. Centring had also to be constructed for the wall of the drum or circular podium, designed to disguise the counterforts and to protect the glazing from the drainage of the dome. The cavities between this wall and the shell of the dome are covered by slabs of concrete, weathered to a sunk gutter or channel near the outer edge that conveys the water to projecting spouts or gargoyles placed between the windows. The flat of the drum is covered with asphalt that passes partly up the dome under the outer covering, as before described. The exposed vaulting and the pendentives around the dome are also asphalted. The wall of the podium is cemented.

* A paper by Mr. John A. Marshall, read before the Architectural Association on April 12.

All cavities are ventilated by drain pipes communicating with the outer air.

The Crypt and Choir.

It would be convenient now to inspect the upper part of the choir, but we had better perhaps descend by one of the eastern turrets and begin at the bottom—on the foundations of the church, in fact. The floor of the choir is some 13 feet above that of the nave, so it was almost impossible to avoid the formation of a crypt, only a very slight excavation being necessary to get the required height. The depth of this excavation was, however, limited to level below which it was impossible to go by an existing platform of concrete, about 9 feet thick, that extends over more than half the site and served as the foundation for the earlier building. As the top surface of this platform practically the floor of the crypt, the architect was anxious to dispense with footings around the apse inside—a slight departure from the Building Act that was graciously permitted; but on the outside footings were provided, though they were not a structural necessity. At that time the footings were covered by the ground that rose above the floor of the crypt, but a subsequent alteration of the level led to their exposure, and they are now again concealed by a retaining wall that forms a low circular podium between the buttresses.

The eastern termination of the cathedral suggests the Romanesque or Lombardic style—if you will—of Northern Italy: the crypt opening into the church, with the retaining wall above, closely following St. Ambrogio's, Milan; the open colonnade under the eaves, the timber roof of the vaulting, are all familiar features. The huge buttresses, however, give distinction, and resist the pressure of the vault having a span of 48 feet. Up to nearly half the height this vault is a solid mass of brickwork, rough-corbelled over to the curve and faced with concrete. Above this level the vault is a concrete shell 18 inches thick at the bottom and 12 inches at the crown. A retaining wall of concrete is built on the haunches to receive the counterforts, or sleeper walls, on which are placed the principal trusses of the roof. The buttresses of the apse rise to the height of the retaining wall, and the two are connected by massive concrete lintels, forming a gallery across the gallery, behind the buttresses. The galleries are covered with concrete slabs, cast *in situ*, that form a flat around the roof. To prevent the arcades of the gallery being pushed out by the expansion of the concrete the flat and the lintels were kept clear of the brickwork until the concrete had thoroughly set; the joints were then made good. The retaining wall above referred to was raised a little above the flat, to form a curb, on which were placed the wood plate for the rafters. The asphalt covering of the flat is turned up the curb and under the plate, the joint being covered by the lead apron flashing of the eaves. The roof is ventilated by drain-pipes, that pass through the retaining wall to the gallery. To convey the water from the asphalt flats throughout the building to the rain-water pipes a dish is formed in the concrete, and at the bottom of the dish a curved length of glazed earthenware drain-pipe is built in, with the socketed end upwards, so that the asphalt could be turned down or dressed into the socket. All rain-water conductors that are built into the brickwork are formed of glazed and socketed earthenware pipes.

But we must not linger over these details, neither have we time to ascend the campanile; we wish, however, before closing this section of our subject, to draw your attention to two singularities in the construction that call for some explanation. Firstly, Why should the vaulting in some cases be entirely of concrete and in others entirely of brick? Secondly, Why should some of the vaulting be protected by extraneous roofs while in other places the surface is fully exposed to the weather? Obviously, when the shell of the vaulting is of a graduated thickness and curved on plan concrete is the strongest and most adaptable material to use; the complications of groin vaulting are also most readily cast in this material. So we find, for the pendentives and the domes, for the vaulting of the choir and chapels, for the more complicated vaulting of the crypt, aisles, baptistery and porches concrete has been used; but for the vaulting of the transepts, and the corresponding vaulting of the triforia, brick is the material employed, in order that the deep soffits of the brick-supporting arches in front may appear as part of the vaulting behind and the line of junction between the two should not show, thus insuring a uniformity of surface texture until the unaffected dignity of the interior is impaired by the application of something more assertive and restless.

Respecting the contrariety of the roofing, it will be as sent to you as it was to the architect that a timber roof the nave and sanctuary, even of low pitch, would have uncouth and harsh; such a roof would also have been monplace, whereas these parts of the building have a distinction not displeasing and most interesting, as they do, from the mighty and unbroken podium led by the lateral chapels, they appear disdainful of section and defy the elements.

But there is a law of contrast as well as of analogy; the variations of this law are, however, easily exceeded, and a careful eye is necessary to prevent the intrusion of distant elements. At the Westminster Cathedral the most interesting instances of its application are afforded by the pinnacles and by the roofs and turrets of the transepts and choir. Structurally it would have been quite possible more consistent to have exposed the vaulting outside throughout the building, and we can imagine what the effect would be. But the Greeks did not always expose their temples to the cold; they appreciated, quite as much as we do, the charm of the rippling garment; even Aphrodite was veiled the luxury of a pair of sandals. And so, at the Westminster Cathedral, the rounded surfaces of the vaulting are not everywhere exposed but discreetly concealed in places by extraneous roofs suggestive, in a measure, of the East beneath.

A piquancy and an interest are thus imparted to the design; we may theorise about discordant elements, but are forced to acknowledge the refining influence of the architect's skill.

When we consider the execution of this great design—way in which the various materials have been put together—it will be admitted that the extreme accuracy and finish of the work are in striking contrast to that spontaneity and directness of purpose so evident in the Christian architecture of bygone times. These early buildings testify to a readiness of execution, resulting in a variation of style, quite unattempted, yet interesting and beautiful; we like to think that this is not entirely due to the lapse of time. We also like to believe, though it may not be true, that when the ancient workman was bedding a stone, or laying a brick, or driving a pin through a tenon, he was not ashamed to finish these slight operations before responding to the imperative call of the foreman's whistle. Nowadays, it would seem, a man may not do this, his work is so much a fascination for him; at the shrill note of the foreman the implements of his toil drop from his hands, and he rushes from the scene as for his life. Under these circumstances the architect feels in the more tranquil atmosphere of his office—when the sublime and the beautiful are not forgotten—he must make for every stone and every brick throughout the building; nothing must be left to the workman's discretion; the genuinity; the serenity of the execution must not be impaired, even by a putlog hole, and this reminds us that no putlog holes were permitted outside the cathedral, where the scaffolding was arranged as for masonry. The extreme precision of the execution just referred to—if it does not only betray the hand of the workman—is certainly evidence of Mr. Bentley's desire to soften down the asperities of architectural design. Anything harsh, uncouth or "out of place," as he termed it, was always avoided; and if this carefulness sometimes led to a lack of vigour or stiffness, it can truly be said that the mass of his buildings never frittered away, the dignity of an unbroken roof, the surface of the walling was left unimpaired, the construction was faultless, the detail telling, yet refined.

Having now dwelt on some of the most salient features of the construction, some reference will be expected, in a design with so comprehensive a title, to the internal decoration intended by the architect to form an essential part of the conception, but which unfortunately he did not live to carry out, and scarcely commenced. When Mr. Bentley received instructions to design the cathedral he had already been out of this country, certainly not to "the land of the citron blooms." He then felt it his duty to see for himself those incrustations of marble and mosaic so lovingly described by Paul the Silentiary and John Ruskin. He did not, however, cross the Adriatic nor visit Constantinople. He had realised his powers, and was therefore in a position to discriminate. He took with him a small notebook, but, excepting four plans of churches, it came back empty. He had neither time nor inclination for mechanical details that would have dispelled the charm, as it did eventually for Ruskin in Venice. The Italian tour did not determine the style of the cathedral, though it confirmed it.

The first sketch plan, made after the architect's return from Constantinople, suggests, in parts, Sta Sophia, Constantinople, though Mr. Bentley never saw that building. The final plan shows as we have seen the influence of St. Mark's, tempered by an ideal he had made his own. Mr. Bentley's suggestions for the revetment of the interior show, as might be expected, an appreciation of the principles underlying the application of marble and mosaic as exemplified at Venice and at Ravenna. The well-defined line of demarcation between the two materials at a uniform level; the high and narrow slabs, rivetted to the walls and piers, and "opened out" so that they could not possibly be mistaken for solid masonry; the strips or facets that roughly follow the curves; the extreme thinness of the veneer, exposed at all salient angles; and, above all, the vast expanses of sheeting, due to the unbroken wall surfaces and the massiveness of the piers, undisturbed by mouldings, and made more impressive by the insertion, at rare intervals, of choicer slabs and by the brilliancy of carving, these are some of the qualities we associate with the ideal type of marble revetment. This being so, it is evident that the essential features of Mr. Bentley's plan scarcely afford scope for a full development of this type. The subdivision or multiplication of the piers, and the lack of unbroken wall surface on the ground floor demanded a treatment on independent lines, that may perhaps be described as a compromise between the Byzantine and the Renaissance.

Another marked divergence from the Byzantine type—in an opposite direction—is seen in the sparing use of columns for the gallery arcades, resulting in a wide intercolumniation, again in favour of the Renaissance. But if the piers and walls do not present an ideal field for the application of marble, this cannot be said of the floor space, where unbounded facilities are afforded for that most essential feature—from the architectural point of view—a marble pavement throughout the building. The value of the marble paving in relation to the wall lining can be seen in the chapel of the Blessed Sacrament, and in the two western chapels of the nave. In the nave itself, a commencement of Mr. Bentley's scheme for the paving has been made by laying the narthex and the strips or borders between the piers and columns, so that these latter are spared the indignity of rising from a platform of wood-block flooring. The marble paving of the sanctuary, around the baldacchino, has just saved this immense canopy from a similar insult, though it can never compensate for defects due to the lack of Mr. Bentley's personal supervision. The same may be said of the organ gallery screens adjoining. Unfortunately, while the painter can rectify a weakness or a false note of colour by a stroke of the brush, the designer in marble is committed for ever to the first touch. His only safeguard is to remember that the doctrine of harmony and restraint applies to all the arts, and if an extensive palette is a snare to the painter it is a still greater entanglement to the designer in marble, whose best effects are produced by a limited range of colours. The most beautiful and varied material used by the architect is soon brought into discredit if misapplied or mixed up with other materials. The simple slabwork of a fishmonger's shop is more impressive than the incoherent displays so often seen in more important buildings, where the chief aim of the designer seems to have been to destroy those very qualities that give value to the material. But the intrinsic value of marble does not depend entirely on the beauty of the colour or the interest of the veining. Strength and durability must be considered, or the result, in our humid atmosphere, may be as transient—if not as beautiful—as a sunset or a smile. In the majority of instances the very nature of the material is against its permanency. The pasty magma and the infiltrated fractures, to say nothing of artificial "stopping," are the channels most infected by the destroyer. Indeed, the few sound marbles of good colour that can safely be used without restraint may be counted on the fingers. The weakest marbles, like certain persons, are often the most attractive; they should be reserved for occasional indulgence only. I will not weary you more than I have already done by attempting a description of the marbles used at the cathedral, especially in view of the fact that the subject of marbles in general has only recently been dealt with by those able exponents Sir Laurence Alma-Tadema and Mr. William Brindley. We may, however, be permitted to remind you that in the two western chapels of the nave Mr. Bentley initiated the principle of framing the variegated revetment with white marble only. Thus there is not that confusion of colour or workmanship, nor that rampant effect of the strings, cornices

and architraves that one so often sees when the reverse method is adopted. In a word, the effect is refined rather than bizarre. The respective merits of these two chapels cannot be considered apart from the mosaics, and if the chapel of the Holy Souls is the most concordant, this is because its mosaic decoration most nearly approaches Mr. Bentley's ideal.

The guiding influence of the architect is here strikingly apparent throughout, and Mr. Symons, who made the cartoons for the mosaics from his own sketches, has admirably followed the architect's suggestions, without that self-effacement that would have destroyed vitality. While not opposed to tradition, the work is as unfettered in style as the cathedral itself. If the general effect is satisfactory, the barbarity of the technique may be condoned.

These subsidiary parts of the cathedral may be regarded as experimental in view of the vast area awaiting decoration in the nave. For this Mr. Bentley left no suggestions—excepting details for the marblework. Some men get ideas very quickly, flashes of inspiration—a kind of radio-activity, and the thing is done. Without a moment's hesitation they rush in where angels fear to tread. No wonder their works look crude and unfinished, and will not stand the test of time. With others the idea grows or develops, they feel their way gradually, one thing leads to another, and ultimately to a solution of the problem. The result has entailed much labour, though it may seem to have been attained without effort—the work endures. This was Mr. Bentley's way.

Mr. H. H. STATHAM, proposing a vote of thanks to the author, said in one respect he was the right person to do so, for no one could be more in sympathy with the paper. They seemed to have got back that evening to real architecture, and not only architecture, but real building. The Westminster Cathedral was a composition of grand building on a grand scale, in which the whole construction was honest and solid and what it professed to be. When he saw frameworks of steel covered over with masonry, a very common sight in London, he was made melancholy, and it had been therefore quite pleasant to hear about work that was built in a different manner. While listening to Mr. Marshall they really seemed to have got to the essential points of a Mediæval building, and although they all regretted very much the death of the great architect of the cathedral, on the other hand they could believe he was a happy man to have such a work to carry out. Mr. Statham said he sometimes wondered whether the interior in its present state did not look finer than it would do when the surface was decorated. In conclusion, he proposed a hearty vote of thanks to Mr. Marshall for his able paper on one of the most remarkable buildings of modern times.

Mr. J. E. NEWBERRY seconded the motion.

Mr. ARTHUR KEEN said the paper was on one of the finest subjects that could be given to a London audience. When he considered such a remarkable work as Westminster Cathedral the idea came to him that good and sound architecture and building could only be produced by the principles of Mediævalism. The building most nearly allied to the cathedral in England was the church of St. Bartholomew at Brighton, built in brick, but treated in such fashion as to give interesting surfaces both inside and out.

The Bishop of ARINDELA, in alluding to the cathedral, said Mr. Marshall was ably carrying out Mr. Bentley's conception. As soon as he began the work they all felt that the deceased architect's mantle had fallen upon him, and they were quite confident how he would sustain it. In decorative work Mr. Marshall had already shown his skill in the wonderful gate and screen in the chapel of the Blessed Sacrament. All they lacked was the means to finish the structure. As regarded the decoration, he had every hope that if Mr. Bentley's traditions were adhered to it would be the proper completion of his work.

The North-Western Section of the Co-operative Union, representing 485 co-operative societies in Lancashire, Yorkshire, Cheshire and Derbyshire, at a conference at Accrington on Saturday approved the proposal to form a co-operative landowning association, with a suggested capital of 100,000l. The object will be to find an advantageous outlet for co-operative capital by acquiring suitable estates, and developing them wherever possible upon garden city lines.

ROAD CONSTRUCTION.

A CONFERENCE organised by the *Surveyor* was held at Olympia in connection with the Building Exhibition. Several papers were read by county surveyors on the administration and construction of roads, from which the following extracts are derived. All the papers are printed in full in the *Surveyor* :—

Need of a State Road Department.

By E. J. Lovegrove.

As far back as 1865, as the result of scientific investigation, tables were prepared in France for the guidance of road-makers in selecting their materials; and reference again to American practice, the Massachusetts Highway Commission, appointed in 1893, governed by three commissioners, with duly appointed engineers, is advised by geologists, and the same scientific advice is sought in this country.

The United States Department of Agriculture has rendered excellent service in the direction of research. For example, one of their most recent publications—*Journal of Agriculture*, 1907—gives the result of investigations as to the decomposition of felspars, and treats of the factors which mechanically and physically modify that decomposition. Results are also given of the cementing values of mixtures of granites or diabases with limestones and dolomites, and the relative solubility of these minerals. Research of this character is of the utmost value. The department also generally advises engineers in respect of materials that they propose to use for highway work.

In this direction the method in England, while essentially practical, is non-scientific, and a great part of the acquired knowledge of experienced road-makers is unrecorded. There is much to be done in the direction of research which would materially assist in the more advantageous selection of rocks for road construction and maintenance. Information is required as to the chemical and mineralogical composition of the rocks used, their structural porosity, cleavage, crushing strength, resistance to abrasion, suitability for treatment by waterproofing material, and the possibilities of obtaining better results by the use in combination of different classes of material.

An office of reference could preserve quarry samples and produce co-efficients of suitability for resistance to highway wear, with recorded notes of actual practice in macadam and all classes of permanent paving. In connection with this subject mention should be made of the valuable assistance which has already been rendered by the Geological Survey.

Too much stress cannot be laid upon the necessity and desirability of the formation of a State highway laboratory, as it cannot be suggested that scientific research will do otherwise than materially assist in bringing about the best possible result in the construction and maintenance of the main and local highways of the country, and this phase of the question could be dealt with on its own merits as distinct from the formation of a State road department.

Design and Construction of City Roads.

By E. B. B. Newton.

Where there are tram lines a width of at least 12 ft. on each side of the track is desirable.

Camber.—The following remarks refer to level roads. For roads with a longitudinal fall, from a mathematical point of view only, the camber should be greater than in a level road; practical considerations require less. Camber of itself does not make a road more or less slippery, but may intensify the effect. Nothing will justify a road being unsound; such a one will be greasy often, but a smooth one occasionally. Therefore, as sufficient camber is essential at present if a road is to be sound, the lesser will be a proper, but not an excessive, camber is obligatory.

The by-laws for new streets require a camber of between $\frac{3}{8}$ inch and $\frac{1}{2}$ inch for each foot in width. For granite macadam and flint gravel carriageways at a point midway between the summit of a channel and the gully, the authorities favour a camber of $\frac{5}{8}$ inch. For granite sett roads about $\frac{1}{2}$ inch of camber, wood roads about $\frac{3}{8}$ inch and asphalt roads about $\frac{1}{4}$ inch, properly set out, though low, are adequate and assist the vehicular traffic.

As usually set out the haunches are too steep and the centre too flat. A cross-section formed of two straight lines is not practicable. The usual circular arc causes the surface to be uneven, as previously mentioned.

Mr. Deacon recommended an approximate hyperbola. Dividing the half cross-section into four equal parts the

se to be given at one-quarter of the width from the hannel is .35, half-way .65, three-quarter way .81 and at the centre 1. The author's rule is a mean between a straight line and a parabola—*i.e.* .33, .63, .85 and 1 respectively. The figures for the usual circular arc are respectively .4, .75, .94 and 1, which shows its defects. If the cross-section of a level road have a small camber the longitudinal fall in the gutters causes the summit of the gutter to be early level with the centre of the road. To avoid this, asphalt is best laid sometimes with an undulating surface longitudinally.

A good foundation is imperative, and for the surface paving the choice of a material depends on local requirements. Wood holds the field perhaps at present. Cork may prove useful. Asphalt must be kept quite clean to be practicable. Tar paving is still uncertain for streets with more than the lightest traffic. Flint gravel has little beyond cheapness and noiselessness to commend it, but it is perhaps the less greasy of all roads. Setts of igneous rocks have numerous points in their favour, but are too noisy as a rule. Some special setts, and perhaps Kleinpflaster, etc., are not quite so noisy. Setts of stratified rocks are little used in cities. Of the igneous rocks for macadam choice must be made of a material which will wear "gritty" and not into a very sticky or clay-like compound with water. As to blinding, its quantity is best minimised, but in the majority of steam-rolled roads it is indispensable, and even for patching small holes in cities various circumstances render its use almost essential. Creosoting wood blocks gives a greasy surface, but its many advantages make it desirable even in the case of hardwood blocks.

An imperfect scheme well executed may be better than a good one badly administered. Only "money will make the mud to go." When a road is dry there is little danger of deslip. Absolute cleanliness of road surfaces removes the danger of slip, but it cannot prevail with excreta, dust, mud and sludge from broken stone roads and soot, &c., in the air. To be clean, the roads and their neighbours must be non-friable and well shingled.

The proper use of water in sufficiently large quantities will keep the roads non-slippery, but the London County Council will not let us keep clean our streets by means of unlimited quantities of water and flushing direct into the sewers, and the washing of wood roads at night is not always advantageous, especially in the winter time, quite apart from the danger of frost.

In cities a proper system of scavenging by orderlies is essential, with frequent receptacles into which the mud, etc., may be swept during the day and cleared away at night. It is obvious that in busy thoroughfares such mud collection during the day is out of the question. Judicious shingling will always keep a road non-slippery, but as fast as the shingle is ground to a paste with moisture the sticky mud must be removed and broken up by the addition of more shingle. This may create an unpleasant state of affairs occasionally, but oftentimes it is the only practicable remedy. Regular shingling of creosoted wood roads is necessary. Shingle preserves its grittiness far longer than igneous rock chippings, which soon grind down into a pasty mud. All should pass through a $\frac{1}{4}$ -inch or $\frac{3}{8}$ -inch square mesh sieve. One objection to flint shingle is that it cuts the rubber of tyres, but the tyre makers cannot grumble at this: owners are saved from side-slip and the few people who prefer igneous rock chippings are not likely to be faced with a deficit in their favourite grit, so nearly everybody will have some comforting reflection if we pin our faith to water and the material which has proved so useful since prehistoric times.

The Uses of Tar.

By A. Dryland.

For many years tar concrete has been used for roads, but until recently has been principally confined to providing surfaces for highways of light traffic in towns. The author, over twenty years ago, converted several miles of boulder-derived narrow streets in a seaside town to tar-macadam roads composed of broken flints from the sea-shore and burnt shingle obtained from the same source. Although the materials were by no means ideal, the purpose of providing a clean and comparatively noiseless roadway was served, and with annual surface dressings of tar and fine shingle and small repairs those roadways are still, I believe, good and efficient. In several seaside towns tar concrete compounded of limestone has been in successful use for many years as a road material. More recently tar slag has been largely used, and with a considerable, although I

believe varying, degree of success. Experiments on a considerable scale have been made with basalts, granites and quartzites as the aggregate for tar concrete. With some of these the author is aware there have been failures. I hope the discussion of this paper will elicit the experience of road engineers upon the suitability and durability of all these materials for tar concrete. It has always appeared to the author that the adhesion of the tar to the aggregate was the secret of success in tar concrete. A good deal has been said and written about the "impregnation" of the material forming the aggregate by the tar. The author would like to elicit opinions as to this impregnation, his personal view being that a material that is sufficiently porous to absorb gas-tar to any considerable extent is not of a sufficiently durable character to withstand any considerable traffic. The author's view is that the principal requirement is a hard material which breaks with a sufficiently rough surface to form a good adherence for tar. Many of the hardest and finest-grained road materials are, in the author's opinion, unsuitable because of the clean smooth surfaces left by fracture.

As to the preparation and laying of the concrete, the following are, in the author's view, essential points:—

1. An aggregate of the character before suggested, free from dirt or dust, with all moisture expelled by artificial heat.

2. Well-boiled gas-tar, that known as "distilled tar" being preferable, applied to the heated aggregate at a temperature closely approaching boiling-point.

3. The thorough admixture of the ingredients in such proportions as will insure the coating of every particle without an excess of tar, the quantity needed varying with the kind of material and the gauge.

4. The ripening of the material previous to laying for a period of four to eight weeks in bulk.

5. A firm and true foundation.

6. A coarse aggregate for bottoming, not less than $2\frac{1}{2}$ -inch gauge, and topping not smaller than $1\frac{1}{2}$ inch for roads having any considerable traffic, with a total thickness of 4 inches at least.

7. The material should be laid on a dry surface, be thoroughly rolled, and receive a top dressing of a small amount of clean stone or slag grit.

Varying success has attended the use of tar concrete, but the author thinks when it has not been successful it has been due to want of attention to some of the above-mentioned details, or to bad weather interfering with the work when in process of laying.

There are, no doubt, limits to the ability of the best tar concrete to withstand traffic, just as there are to the best ordinary macadam. In the author's opinion it is more likely to be a success on open roads than in damp or perpetually shaded situations, excess of moisture being deleterious to the life of the tar.

By tar grouting the author means the use of tar in some form in place of the usual slurring of ordinary macadam roads. It has been used with considerable success, especially when followed shortly after by a surface dressing of tar and grit. It is of the utmost importance that the whole operation of laying the macadam and the grouting should be performed in dry, warm weather, when both the road and the material are perfectly dry, and the metal should be firmly consolidated before the tar is applied. The author has seen successful results obtained by this method with a top dressing of clean $\frac{1}{4}$ -inch basalt chippings.

Under this head a reference might be made to the system of spreading the metal upon a layer of fine and rather moist tar concrete and rolling until this is forced upwards as a grouting. The author has not seen this carried out, but sees no reason why it should not meet with considerable success, especially if followed by a top dressing.

For tar-painting and spraying a very dry road is essential and hot weather a great advantage. Moisture in the road surface will prevent proper adhesion of the tar. A newly-coated road surface is also necessary to any considerable measure of success. Once the surface had become worn and compacted the tar cannot penetrate sufficiently, and a thin film only is formed, which is destroyed by wet or frost.

Another most important matter is the thorough removal of dust from the surface and between the stones, to permit a sufficient key. All those who have had much experience in the application of tar know that it refuses to penetrate fine dry dust, and will realise the importance of thorough brushing. It has occurred to the author that if a suction process, similar to that in use in the "pneumatic cleaner,"

could immediately precede the application of the tar it would be advantageous. Perhaps some of the designers of tar-spraying machines may develop this in some practical form. The deeper the penetration of the tar the nearer the success of the process of tar-painting or spraying will approach tar-macadam, and the removal of the dust to a good depth is essential to penetration. Attempts at injection by force will, in the author's opinion, fail unless the dust is thoroughly removed.

Non-Skidding Road Surfaces.

By Douglas Mackenzie.

The primary necessity in selecting a material for a non-skidding road is to have a compound surface composed of two or more substances, differing in the degree of hardness, but these materials must be so finely divided that the road is sufficiently smooth for perfectly free rolling. The coefficient of friction on such compound surfaces is very high, amounting to as much as '8, but a further consideration of equal importance is that none of the substances of which the surface is composed should be able to form grease or a lubricating substance under the attrition of traffic.

Granite is an ideal substance for this purpose, because it is composed of crystals of different materials differing in their degree of hardness, but it is impracticable to make roads of granite perfectly monolithic—that is to say, in complete slabs—the full width of the road. In order to make it practicable to construct a granite road the material has to be divided into blocks of a sufficient size for convenient handling.

The most perfect granite surfaces are to be seen in Hamburg, where large setts are used, cut with extreme accuracy, so that the surface is perfectly flat and the joints are so small as to be practically indistinguishable. This is quite a different class of road to the granite sett roads in our English towns, where the surfaces of the individual setts are very much rounded, and the tyres of wheeled vehicles, instead of rolling smoothly, have to bounce from sett to sett. Granite roads made with perfect setts are almost noiseless, the only sound being due to the hammer of horses' shoes, and as this antiquated form of haulage is steadily reduced the noise will be inappreciable.

An approximation to this form of granite surface—very much cheaper—is that employed on many of the German country roads, and which is known there as "Kleinpflaster." It is introduced into this country under the title of "cubette paving" or "durax paving," and is composed of small setts laid at random, and broken by special machines to about $4\frac{1}{2}$ -inch cubes. As the joints are none of them square to the direction of motion, the wheel is always riding on two or more of them, and does not jump from set to set. Consequently the wear on these setts tends to smoothen the road instead of roughening it as with common town setts.

Next to the first-class quality setts employed in Hamburg the best surfaces are obtained by breaking granite to about $1\frac{1}{2}$ -inch cubes, and binding it by means of an elastic matrix. It is, however, necessary to remember that the interspaces between the pieces of broken granite should be very small, and therefore the $1\frac{1}{2}$ -inch granite should be mixed with some $\frac{1}{2}$ -inch, some $\frac{3}{4}$ -inch and some granite dust, so that the quantity of matrix required is very small and the joints between the pieces of granite in the road surface will never be more than $\frac{1}{8}$ -inch under the most adverse circumstances. There seems to be a great difficulty in getting tar to adhere to granite, and so the tar has to be treated by distillation and also by the addition of various substances so as to considerably alter its nature. There are half a dozen such materials now on the market, and they will not only adhere to granite, but they are unaffected by English temperatures and do not become soft in summer and brittle in winter as is the case with untreated tar. These materials give an exceedingly good surface from the non-skidding point of view, because not only do you have the advantage of the compound nature of the granite, but you have the addition of another substance of a different degree of hardness in a sufficiently fine state of subdivision to give you the ideal roughened surface. It is also practical with such a matrix to use limestone in a state of fine subdivision where limestone is much more easily obtained than granite, but this is not quite such a suitable substance, as finely-ground limestone has certain lubricating properties, and therefore the mud arising from this surface in wet weather makes a nasty slippery grease.

Great objection is raised by some councils to the cost of improved roads made on this system, especially for country roads, but it must be remembered that a great deal of the

deterioration of country roads is due to the effect of weather instead of traffic, and if a thoroughly waterproof road constructed in the first instance it is absolutely weatherproof, and therefore does not deteriorate from any other cause than the attrition of passing traffic.

I have already mentioned that one source of skidding, due to the action of gravity when the surfaces are incline and with a properly waterproof surface the water will run off with much less camber than the old-fashioned road. Probably a camber of 1 in 50 will be quite sufficient for these roads, and therefore the skidding due to the pull of gravity towards the gutter need not be at all a serious matter. The mistake has been made in some parts of the country of adopting waterproof roads with the same road contour as that previously in use, but one of the great advantages of modern materials is the reduction of the camber which they will permit.

Road Bridges.

By Howard Humphreys.

As bridge design to carry self-propelled traffic occupies more and more attention, I trust you will be with me if I make one or two suggestions, especially with regard to arches.

In the first place, and generally, it is a mistake to use iron or steel girders where it is possible (even at a slight excess of cost) to use good brick, stone or properly designed armoured concrete.

With regard to arch bridges. In this class of bridge little attention has been given in the past to the ratio of rise to span. I have had to determine the direction of the thrust line in very many bridges of this class, and, speaking broadly, the conclusion I have come to is that the strongest form is that in which the ratio of rise to span varies between one-quarter or one-third to one, as then the arch realises its best theoretical form under ordinary loading, namely, that of an inverted catenary.

In the construction of the arch itself the fact is often overlooked that when loaded such arch may be considered as a special condition of a "bent column." No one would think of building a vertical column of brickwork to carry load without most carefully bonding the courses together, but moving loads acting upon a bent column have far more tendency to separate the rings of brickwork than dead moving loads have to cause severance between the courses of an unbonded vertical pillar. It would seem, therefore, as though there was overwhelming reason for bonding arches. I am aware, of course, that a difficulty will once present itself to your minds, namely, that in small radius bridges the joints at the extrados of the arch will be exceedingly wide if my suggestion is followed, but when the radius exceeds 14 feet this is not the case. Where the radius is less it is possible to build partly in rings, but with bonders through here and there.

My attention was originally drawn to this point by Mr. Richardson, the well-known engineer of the Severn Tunnel. He held, I think, that an arch built in vertical bond was about one-third to one-quarter stronger than one built in rings, and I see no theoretical or practical reason for doubting this conclusion. Arches should invariably be set in Portland cement mortar, not only on account of the great power of adhesion, but because it prevents permeation of water through the brickwork, and consequent erosion of joints.

Weakness sometimes shows itself in brick and stone bridges through the spandril walls being too light, and either bulging or sliding bodily outwards. There is a natural dislike to putting tie-rods with unsightly washers in new bridges, but it is quite possible to put in such tie-rods and conceal the washers under the facing course of the spandril wall. I know of no better preventive of bulging or sliding than properly-placed tie-rods, as the bonding of spandrils to the extrados of an arch is difficult and unsatisfactory.

THE NATIONAL GALLERY.

IN the report of the Trustees of the National Gallery for the past year it is said that at a meeting of the board on July 24 Sir John Tanner, on behalf of H.M. Office of Works, submitted plans for the extension of the Gallery at Trafalgar Square. These plans were approved, subject to a recommendation that larger lights should be provided where possible, for the ground floors, and copies of the plans, as amended and finally approved by the Directors,

have now been deposited with the Trustees. The importance of this extension for the proper exhibition of the collection is very great. Many admirable pictures are now hanging so high that they cannot be properly seen, and many examples of the Dutch and Flemish schools are too crowded to be appreciated. The twenty screens now in the room spoil the dignity of the rooms and seriously impede the supervision, while the light upon them is almost always too vertical for the pictures upon them to be properly seen. It is hoped that the extension will make screens unnecessary. The Trustees urge the importance of carrying out the enlargement of the building with the least possible delay.

Among the additions to the collections are:—"Lulli and the Musicians of the French Court," by Hyacinthe Rigaud; "Diana of the Uplands," by Charles W. Furse, R.A.; "Chaucer at the Court of Edward III.," by Ford Madox Brown; "Hero and Leander" (a marble bas-relief) by H. Armstead, R.A.; "Thomas Gainsborough, R.A." (a marble statue), by Thomas Brock, R.A.; "The Fortune Teller," by George Morland; "Lady Cockburn and her children," by Sir Joshua Reynolds, P.R.A.; "Venus and Cupid," by Velasquez; and twenty-six paintings by Italian artists. The Gallery in Trafalgar Square was visited by 9,387 persons on the free days during the year, showing a daily average of 2,750. In addition 41,952 persons visited the Gallery on Sunday afternoons. On students' days (Thursdays and Fridays) 63,371 persons were admitted.

The National Gallery of British Art at Millbank has been visited by 264,423 persons on the free days during the year, showing a daily average of 1,271. In addition 39,504 persons visited the Gallery on Sunday afternoons. On students' days (Tuesdays and Wednesdays) 48,207 persons were admitted.

The total number of students' attendances at the Gallery in Trafalgar Square on Thursdays and Fridays throughout the year was 16,245. Independently of partial studies, 5 oil-colour copies of pictures have been made, viz. 4 from the works of sixty-seven old masters and 381 from the works of twenty-one modern painters. Three hundred and eighty-four new students have been entered on the books during the year.

The total number of students' attendances at the Gallery of British Art on Tuesdays and Wednesdays throughout the year was 9,476; and, 251 completed copies of the pictures have been made in oil-colours, 123 in water-colours and twenty-one in pastel. Sixty-six new students have been entered on the books during the year.

ASSOUAN DAM AND THE TEMPLES.

An important despatch relating to the raising of the Assouan Dam has been received from Lord Cromer. Already it is said the reservoir has conferred enormous benefit on Egypt. Sir William Garstin estimates that the value of the lands already provided with perennial irrigation has been increased by no less than 24,510,000*£*, and that, when the canals now in course of construction are completed, this figure will rise to no less than 312,900*£*. The increased rental value is already 65,000*£*, and will eventually amount to 2,022,350*£*. The whole of this rise in value is directly attributable to the construction of the dam. In addition to this, the cotton crop, the value of which was estimated last year at 1,000,000*£*, has been secured. There is, it appears, no other alternative, but the raising of the walls of the dam over 23 feet unfortunately involves the almost complete submersion during a portion of the year of the temples of Philæ. Lord Cromer said he received a short time ago a letter from the Society of Antiquaries of London, in which they expressed themselves as follows:—"The Society feels bound to enter a protest against any scheme that would involve the wholesale destruction of historical remains, unless it be clearly demonstrated that the scheme is an absolute necessity for the well-being of Egypt, and that the same benefits cannot be obtained in any other way. Lord Cromer submits that the requirements very reasonably put forward by the Society have been fully fulfilled. No one can regret more than himself the necessity of bringing forward these proposals. On the other hand, he has no hesitation in saying that it would not be justifiable to sacrifice the present and future interests of the people of Egypt in order to save the submersion of the temples."

Sir William Garstin in his report says:—

"When many years ago it was decided to build a dam at the Assouan cataract, thus forming a reservoir which

involved the partial submersion of the Philæ temples, the reproach was brought against the Department of Public Works that it had selected this particular site without any investigation of the Nile Valley to the south of Wadi Halfa. It was also asserted that other places equally suitable for the purpose might probably have been found on the river whose selection would have obviated the necessity of flooding certain of the Nubian monuments. At the time that the project for Assouan was prepared an investigation of the kind proposed would have been impossible, as the entire region south of the frontier at Sarraas was in the hands of the forces of the Khalifa. Such a reproach can no longer be brought against the Department. The question before it is how best to preserve records of these ruins, and minimise the injury that must be done to them by their submersion. It is needless to say that every possible precaution will be taken to save them, and that the funds necessary for such an object will not be grudged by the Government. With regard to the measures that should be taken, I think I cannot do better than attach to my present note a memorandum written by Captain Lyons. His opinion will, I feel sure, carry great weight.

His principal suggestions are as follows:—An archaeological survey of Nubia should be carried out at the expense of the Government, and every effort should be made to render it as complete as possible. The different archaeological societies in Europe should be invited to co-operate with the Egyptian authorities in this work by sending representatives to assist in these researches. Wherever possible, the foundations of the monuments submerged should be reconstructed and consolidated, as was done in the case of the Philæ temples. Such repairs as may be considered necessary to insure the stability of their superstructure should also be undertaken. A thorough and complete examination of all the ancient sites, settlements and cemeteries which will fall within the limits of the raised water-levels should be carried out, and drawings or photographs sufficient to preserve a complete record must be made by competent artists. Lastly, the results of these investigations must be published to the world. I have no hesitation in stating that this programme will be adopted, and I trust that in this way the injury caused may be minimised as far as is possible.

With regard to the monuments upon the Philæ Island, which to many visitors form the chief attraction of the Nile journey, I propose to make a few special remarks. I have been informed that the question of moving these temples from their present site and rebuilding them upon a spot well above the water-level has been again raised. In my note upon "Perennial Irrigation," published in 1894, I suggested moving these structures to the adjacent island of Bigeh, at an estimated cost of 200,000*£*. This proposal raised a storm of dissent and disapproval from archaeologists, and the idea was consequently abandoned. I do not know by whom it has now been put forward.

Since this proposal was made the Government has consolidated the foundations of these buildings by underpinning them, carrying the masonry everywhere down to the solid rock. Their stability is now assured, and I have no hesitation in saying that they are safer than they have ever been since first constructed and far safer than the majority of the monuments existing in other parts of Egypt. There is consequently no fear of their being structurally injured by the raised water-levels. With regard to the inscriptions, it is not so easy to foretell what the effect of the flooding will be. It may, however, be fairly anticipated that those on the higher portions of the stonework, which have not been affected by the deleterious salts contained in the rubbish of the Coptic village which formerly covered their bases, will remain as clear and as sharp in outline as the marks cut on the old quay walls, which have been submerged annually for some twenty centuries. Of course, the accessibility of these temples—to the winter visitor—will suffer, and this is certainly most regrettable.

Anyone wishing to see them, however, can do so by visiting Assouan between the months of July and October. During this period they will be annually uncovered. I now consider that it would be a mistake to move these temples. There would be no gain to their stability. Their accessibility could only be slightly improved, and they would no longer stand in their original surroundings. Lastly, their inscriptions—which it is intended to carefully copy and record—would be endangered by such removal.

Another proposal has been made, namely, to build a watertight wall round the temples, high enough to prevent the water from obtaining access to them. I do not think

that this proposal is practicable. Such a wall would never be really watertight, and it would undoubtedly spoil the monuments from an artistic point of view, as it would preclude any possibility of their beautiful outlines contrasting, as they do at present, with the natural setting in which they were originally placed. I think, then, that it will be wiser to leave them as they stand.

I have already alluded to the regret that is felt by all those upon whom the unfortunate necessity has been imposed of recommending a course calculated to do injury to these picturesque and interesting relics of an earlier Egypt. By none is this regret more keenly felt than by me. I have repeatedly stated in my previous reports upon the subject that, unless it was proved that no other alternative was possible, I would never recommend the raising of the Assouan Dam, and the consequent further submersion of the Nubian Valley. I should certainly not do so now were I not convinced that it is the only course possible, and that the decision now taken by the Government is one that cannot be seriously challenged.

Captain Lyons, the director of the survey, in his report says:—Much has been done to preserve the ancient monuments of Egypt, but in the areas to be submerged not only such ancient monuments as exist, but all records of the earlier civilisation of the region, must be carefully and accurately collected and studied.

The work falls into three divisions:—1. The conservation of such structures as may be wholly or partially submerged by the consolidation of their foundations. 2. Repair and reconstruction of the upper portions of these where such is advisable. 3. The systematic study of the ancient structures, sites, settlements, cemeteries, &c. The first two of these will require the services of a capable architect, while the last will need the co-operation of students of archaeology.

In 1895 a survey of the Nile Valley on the scale of 1:100,000 was made from Assouan to Korosko, and the results were published in 35 sheets. Since then the cadastral survey has been completed, and accurate maps (scale 1:25,000) are available for the whole of the cultivable areas, and can easily be extended to include any outlying sites. It is most desirable therefore that the systematic study of the reservoir area should take the form of an archaeological survey of this portion of the Nile Valley, for which the topographical basis is already prepared. Certain well-known archaeologists have in recent years examined portions of the region, and their advice would be of the utmost value. On the previous occasion want of the necessary funds and the superior attractions of sites in Egypt probably prevented archaeological institutions from undertaking investigations in Nubia. It is to be hoped that the Egyptian Government may be able to allot funds not only for the necessary works of conservation, but for the prosecution of an archaeological survey of the region, with the aid of archaeologists whose studies have led them to explore such fields of archaeology as are represented in Lower Nubia, and the publication of the results.

Ozonair, Ltd.

SIR;—The attention of my clients, Messrs. Ozonair, Ltd., has been drawn to the fact that there is being circulated at the present time the prospectus of a company called "The Craig Ozonizing and Ventilating Company, Ltd." The prospectus, which is dated March 13, 1907, states that the company is formed to acquire from John Richardson Craig, jun., of 145 Bath Street, Glasgow, all his rights and title to and interest in the patent accepted for the United Kingdom, No. 16681, dated August 17, 1905. The prospectus in referring to what is probably the most important part of any ozonizer, viz. the electrodes, sets forth that "the electrodes have been specially designed to obtain from the silent discharge the highest possible efficiency in producing ozone from oxygen or atmospheric air," and reference to the specification of the patent proposed to be acquired shows that the electrodes are therein described as being made of sheets of wire gauze. No mention, however, is made in the prospectus of the fact that my clients, who are the owners of Letters Patent No. 4548 of 1903, gave notice on December 31, 1906, of opposition to the grant, nor of the fact that the result of such opposition

proceedings was that in the preamble to the claims Mr. Craig's specification the words, "I lay no claim to the use of wire gauze sheets in the construction of electroc in ozonizing apparatus" were inserted, and Claim 3, which laid claim to the electrodes, was abandoned.

It should also be mentioned that there is set out in the prospectus a report upon the patent by Messrs. Robert Brown & Co., of Renfield Street, Glasgow, and they are referred to as the well known patent agents. Further, contrary to what would appear to be suggested in the opening sentence of their report, no patent had been granted at the date of such report, the above-mentioned opposition proceedings being then pending.—Yours faithfully,

L. MELVILLE CLARK.

53 Chancery Lane, London, W.C.:

April 19, 1907.

GENERAL.

The Glasgow Institute of Architects at their annual meeting elected the following office-bearers for the year: President, Mr. James M. Monro; vice president, Mr. George Bell; auditor, Mr. Alex. Skirving; secretary and treasurer, Mr. C. J. MacLean. The various committees for the year were also appointed.

The Will of Mr. John Finnie, aged seventy-seven, Tywyn, Llandudno, Carnarvon, and of Cook Street, Liverpool, the artist, for forty-one years headmaster of the Liverpool School of Art, and before that for some five years in business in Newcastle as a glass painter, has been proved at 1,409/.

The Ancient Abbey of St. Mary at Buckfast, on the bank of the Dart, is being restored by the monks in memory of Abbot Natter, who perished in the s.s. *Sirio* off the coast of Spain last August. The community have resolved to work upon the old lines, and to fashion the new building with their own hands. At the present time some of the monks are busy facing the old stones and overhauling the foundations.

Selby Abbey is to be reopened after complete restoration on October 19. The work will cost, according to the estimate, 50,000/., of which 17,000/., remains to be raised.

The Annual Meeting of the Artists' General Benevolent Institution for the relief of distressed artists and the widows and orphans was held on Monday. Sir Edward Poynter, P.R.A., was re-elected president, and Sir Arthur Webb, R.A., was re-elected treasurer. It was announced that the festival dinner would take place at the Hotel Métropole on May 9. In the ninety-second annual report the President and Council congratulated the subscribers upon the continued prosperity of the Institution. The gross receipts in 1906 were 5,422/., 19s. 11d., the sum of 2,895/., 6s. 6d. having been subscribed at the last dinner. The amount of 4,326/., was distributed during the year among 203 applicants in sums varying from 10/., to 100/.

The Establishment Committee of the London County Council have had under consideration the question of the county hall, and a statement of the exact position of affairs in regard to it is in course of preparation. A hope was expressed on Tuesday that the committee would be able to lay it before the Council very shortly.

M. Ch. Sedelmeyer, the picture dealer, has arranged to have auctions of his collections in his galleries in the Rue de la Rochefoucauld, Paris. The English and French paintings of the eighteenth century will be sold on May 16, 17, and 18. The works of other schools will follow. The sale will end on June 14.

Mlle. Heuvelmans is one of the ten students who are engaged in the final competition for the Prix de Rome in sculpture, being the first lady who was considered eligible for the distinction.

The Curator of the Walker Art Gallery, Liverpool, is endeavouring to arrange a memorial exhibition of the work of the late John Finnie, R.E., in the Walker Art Gallery on an early date. He is especially anxious to trace examples of Mr. Finnie's early work in domestic genre and of the period during which he painted landscapes in the quasi-Raphaelite manner of Davis, Windus and Huggins.

The Special Committee of the Manchester Corporation appointed to consider the establishment of a work committee have reported against the project, because among other reasons, they believe it would increase the municipal debt and be a serious check to progress and discovery.

THE WEEK.

letter which Mr. FREDERIC SHIELDS sent to the Mayor of Manchester, in reply to an invitation on occasion of the opening of an exhibition of the s works, merits a place in the archives of the ration. Mr. SHIELDS wrote:—"The generously terms of the telegram just received have cheered eatly, so that I cannot refrain from a more explicit ssion of thankfulness than my answering wire ted. Marvellous is it to me that this rich recog- should come from the chief magistrate and other representatives of the great city into which I was d, alone, a friendless youth, without a relative, to with the extremest poverty for long years. When ngth emerged from the depths, with the attain- of some small artistic skill, it was in Manchester st success was reached, and many names of ester men are cherished in my heart who en- ed me by the purchase of my works and the al of most faithful friendships. And now, again, he length of my sojourn in the Metropolis might ccount for oblivion of my being, Manchester es forth her friendly welcome to my works, and this day have rendered as friendly welcome to my had I been able to avail myself of her cordiality. cross my desire to respond to this invitation there en a stern 'It is forbidden!' is the one grief that s my happiness in the possession of the goodwill d this day from dear old Manchester, my foster-." Mr. SHIELDS was born in Hartlepool, but he his artistic career as a designer in Manchester, eral of his pictures were executed in that city.

OTHER public meeting has been held in Shrews- aid in obtaining funds for the restoration of the of the abbey church. A tender amounting to was lately accepted, but the rehanging of the d other expenses will increase the amount rl to 3,000*l*. Towards that amount a sum of was promised. The Rev. Prebendary AUDEN a interesting account of the origin of the building. he said, on February 25, 1087, that the great DE MONTGOMERY founded Shrewsbury Abbey. ere told that there existed at the time of the invasion a little wooden church near the side ver Meole, which flowed into the river Severn. sult by the great SIWARD, and was in possession er priest, ODELERICUS, who was one of the wise as and friends of ROGER DE MONTGOMERY. This as a man of property and importance, and he s patron to found an abbey upon the site of the wooden church, and volunteered to give his own r for the purpose. The idea was accepted, and on ay 28, 1087, ROGER DE MONTGOMERY went with a s retinue, in solemn state, to the little church ter, and there pledged himself to erect a stately its site, and to endow it with all the suburb of that lay outside the eastern gate. He laid his on the altar as a solemn pledge of his inten- e carried it out, and within the next few years ally abbey rose. Seven years afterwards (1094) as an old man and broken in health. He was e the time at the castle he had erected where rry Castle now stood, and after the manner of e decided to become a monk. He laid aside ta, and became a brother of the monastery he ounded. After a few days' illness he died, and ued between the high altar and the altar of the hel. Within the building there rested the ashes nom he might describe as one of the great race ous Salopians whom he believed they all de-

lighted to honour. Since that time the abbey had passed through many vicissitudes. It became one of the most important abbeys in the country; but afterwards it went through the dreadful time of Tudor spoliation, and was to a great extent ruined. In fact, as had already been observed, it would have been removed from the face of the earth if it had not been the parish church as well as the church of the abbey.

ARBITRATORS serve temporarily as judges of the High Court, and should be remunerated at correspond- ing rates. But officials of the Courts are disposed to adopt a different standard in dealing with the expenses of an arbitration. Last week an appeal was heard before Lords Justices MOULTON and BUCKLEY concern- ing an effort to cut down fees. The case arose in con- nection with the building of the Bexhill asylum. Messrs. LOVATT, LTD., were the contractors, and a sub-contract for plumbing was entered into with Messrs. S. MASON, LTD., which amounted to about 15,000*l*. There was a difference between the two firms respecting a sum of between 3,000*l*. and 4,000*l*. It was referred to Mr. GEORGE FENWICK, the surveyor, who decided in favour of Messrs. LOVATT. His account amounted to 536*l*. The hearing of the evidence occupied him during twenty- two days, for which he charged 10 guineas a day. Time was also spent in preparing the award, and it was also necessary to pay for legal advice. Messrs. MASON took exception to the amount, and it was reduced by the Birmingham District Registrar to 240*l*., which amount was confirmed by Mr. Justice RIDLEY in chambers. Mr. FENWICK appealed. Counsel said that the Registrar considered that the services of an arbitrator could be obtained for five guineas a day. Lord Justice MOULTON said it was of great importance that litigants should have the services of men of experience and of character in such cases, but they must expect to pay fair fees for such services. He did not think they could have got a professional gentleman of eminence to act as arbi- trator for less than the sum claimed. The fees charged by the appellant were fair for a person in his position in his profession. Lord Justice BUCKLEY concurred, and the appeal was therefore allowed. An investiga- tion which required over three weeks could only be conducted by a man of exceptional capacity, for with technical evidence relating to the details of plumbing there is no opportunity for those pleasant interludes which arise in ordinary Courts, and which allow of the relaxation of attention on the part of the judge. It is possible the services of a very young barrister might be obtained for five guineas a day. But no architect or surveyor of standing could afford to lose twenty-two days without fees of a higher amount.

THE name of the historical painter ARTHUR MÉRICE is not known outside France, but he was comparatively wealthy, and has made good use of his possessions. The house in which he lived and other premises in the Passage du Trône he has bequeathed to a philanthropic society, in order to be converted into four separate institutions, viz. a sanatorium for consumptives, a dis- pensary for the poor, a night asylum and "un fourneau économique." A sum of 800,000 francs is also left for upholding the establishments. The position in which the property stands is not entirely unsuited for a sana- torium. The Passage is confined, but it is in the vicinity of the Place du Trône, which is a fine open area well adapted to serve as a place of assembly out- side the barrier of the city on one side. It was there the great throne and triumphal arch were erected to receive LOUIS XIV. and MARIE THÉRÈSE after their marriage, and it must also have been one of the principal places of execution during the first revolution. Vin- cennes is also within a short distance of the proposed sanatorium.

ARCHITECTURE AT THE ROYAL ACADEMY.

IF considered, as the Royal Academy is generally, as a spectacle, the Architectural Room this year is unusually successful. In the preceding 138 exhibitions we doubt if so high a standard of draughtsmanship was ever reached as is now apparent. There are water-colour drawings of interiors which LOUIS HAGHE would have admired, and the majority show an absence of conventionalities which is satisfactory. There are only about two hundred drawings, but as many are so small as to appear insignificant by contrast, the exhibition may be said to depend for interest on about one hundred examples.

Another peculiarity is worth notice. Any ordinary visitor who took the trouble of comparing the list of exhibitors during a few years could hardly fail to arrive at the conclusion that a limited number of architects seemed to have a monopoly of the wall space. This year several new names are inscribed in the magic circle. Although they may not be connected with designs of a revolutionary character, they at least suggest that the committee for once at least showed a willingness to encourage men who hitherto were outsiders among outsiders.

Recently there have been indications to recognise important competitions by allowing several of the designs to appear. This year the "Palace of Peace" has its turn. It was wise to fix on that project. If tested by the list of prizes, England somehow did not appear to stand well in the competition. That, no doubt, might arise from having a jury who were governed by principles which were not valued among us. But when the fantastic design which was adopted was reproduced in the newspapers, people could hardly avoid thinking that the English designs must have been very inferior in quality if they could be surpassed by such a production. The eight or nine designs which are now in the Academy are enough to demonstrate that the English architects deserved more respect than was meted out to them. It is in a way to be regretted the favoured design cannot be seen without being formally exhibited (for no committee of the Academy would allow it to be hung through its merits), in order that the public could understand the peculiarities which captivated the jury. In fact, such a selection as occurred at The Hague is a satire on the system of deciding architectural competitions by the aid of jurymen, and it would have been more expeditious and quite as reasonable to draw lots, or shoot, or gamble for the man who was to have the prize.

The first of the Palace designs we see is one showing the detail of the chief entrance by Mr. J. C. CARTER, of Cardiff. It is a pity the whole design was not exhibited, for near the entrance the windows appear as if they were elongated by some force acting from above or below. The care taken with one part indicates that Mr. CARTER endeavoured to adopt a rather original treatment, which to some at least would make the Palace appear as symbolic. Mr. JAN F. GROLL evidently believed that towers and turrets would suggest the aspirations of the founders. Mr. S. D. ADSHEAD assumed a low building of Classic type would best serve for occasional congresses; but his treatment of details, although suitable to a novel building, will not win approval. Mr. JOHN BELCHER evidently acted as if he were preparing a design for a *bona-fide* syndicate in the City. He submitted geometrical drawings, and from those of the grand staircase and the longitudinal section, which are in the Academy, we can see that he avoided everything that could be considered as sensational. It is an example of modern Classic which would be pleasing if carried

out as suggested, but which would enable a millionaire to be gratified if he cared to invoke the auxiliary for its adornment. Messrs. PAGE & HALLEY suggest an ornate entrance and dome, but the contrast is strong between those parts and the plain window of the body of the building. Mr. CLIFFORD ELLIS' design is rather indefinite in the general effect, but the details may have shown more decision. The design by Messrs. WILLS, ANDERSON & COTMAN soon recalls the views of ancient Assyrian palace-temple. The cube appears to be selected as the unit, and the upper part is suggestive of an altar on which bloody offerings to Peace could be sacrificed. It is not one of the most interesting of the competition designs, but asserts itself among the whole collection in the room. Mr. H. T. HARE treats his design with unusual breadth to be seen in his Classic details. The ordinary windows of the room gain by flanking with emblematic figures in relief. The dome is raised and appears rather squat, but it may have been considered most suitable in a flat country. The colour of the design by Mr. A. W. S. CROSS might be taken as representing one of the palaces of art in the Champs-Élysées on some festive occasion. The column with its statue of gilded bronze appears to be a necessary part of the composition, although absent from the programme. The buildings appear at their best and are undoubtedly most attractive.

We must now glance at the ordinary work of the time as it appears in the room. Messrs. RUSSELL & COOPER show their "St. Pancras Central Library." The site resembled a truncated triangle at the corner of the thoroughfares. The building is low, and by employing a range of columns on the principal faces the design becomes an ornament to the district, apart from its utility as a building. Mr. HALSEY RICARDO's "Addison Road, Kensington," has attracted attention, and is often referred to as a model of adoption in our smoke-laden Metropolis. The design is liberally but not lavishly introduced with colour without. The style is more Italian than Modern, and the green of the garden is continued through the outer walls. In the interior hall there is colour in the lower part, but its attractiveness must make the upper part appear rather cold and incomplete. Colour is a foe to economy, in whatever manner it is employed. "Polesden Lacey, near Dorking," by Mr. A. M. POWNALL, on one face appears a long, plain, white building with external shutters of green to the windows, but the south elevation looks like eighteenth-century work. The "Courtyard of House at Witley, Surrey," by Messrs. FORBES & TATE, shows plain timber work which have a good effect. The "Proposed House at Camberley," by Messrs. POULTER, suggests a good example of a commodious building with large windows. It is a finesse about the drawing, especially in the window by which they appear to have some novel features. In the "Residence at Camberley" the window-hells are rather novel. The "Proposed 'Temple' School at Rugby School," by Mr. JACKSON, R.A., disintegrates in its parts; the roof is awkward, and spoils the effect of keeping with the tower or turret.

A "Villa at Antibes" is the only contribution by Messrs. GEORGE & YEATES, and it is "skied" by the building has an appearance of being in keeping with the place. The red roof and white walls stand out against the luxuriant vegetation. The two vases in the foreground have also an excellent effect. The Ground is so valuable within the City it is no wonder it is found more economical to substitute loft buildings for those which used to serve for business purposes. The "New Offices for the Northern Assurance Company, Lothbury, E.C.," by Messrs. E. MOUNTFORD & E. A. GREENING, corresponds with the latest accepted treatment. The ground storey is treated with semicircular windows, for the exterior in the Regent Street Quadrant is approved by architects if not by traders. There are three floors, with the

ter columns, a bold cornice and attics. "Wyphurst, Leigh," by Mr. R. BLOMFIELD, is a large house and is shown by a vigorous drawing in pen and ink. It is used in the walls, with occasional patterns of a deeper colour, and it could be taken as an Early Renaissance example. The "United University Club" shows a similar view from that of the illustration published last week. Some of the windows are large; there are "flags" and armorial shields which enhance the structural masonry of an admirable building.

Mr. BRIERLEY, of York, has adapted the arrangement of the "New Dining-Room at Normandy Park, Wiltshire," to accommodate paintings which already existed, and the panelling of the walls and ceiling has been adapted for a purpose which is not always visible. The dining is among the finest in the room. "Interior of a House in Northumberland," by Messrs. OLIVER, SON & WOOD, shows a gallery on two sides with a frieze on another wall. The whole is suggestive of a former age. Messrs. L. F. CRANE & D. F. BLOW show rows of small cottages around a green space at the end of a street, and the drawing reveals possibilities for landers which are not ruinous. The "Entrance Hall and Staircase, Redhill, Surrey," by Mr. S. W. GRANT, is a panelled composition which would serve in a future age. The "Study for the Courtyard of the Gatehouse of the Monastery, Caldey Island," by Mr. J. C. FERRIS, is marked by a desirable unity. The great arched way on one side is in keeping with the large arched windows of several lights, and the smaller windows also have arched heads. The curves form a contrast with the horizontal lines of the roofing and the vertical of the tower. Another panelled dining-room with a frieze introduced over sideboard is by Mr. C. ELIOT. The design for Hither Green Library, a one-storey building, is shown by Mr. S. TOWSE. The "Gaiety Theatre, Strand," by Messrs. E. RÜNTZ & FORD, is a presentation of the curved end and cupola, but the design fails to suggest the height of that part of the building. St. Peter's, Hammersmith, has been traditionally considered to be one of Sir CHARLES RESSY'S early churches, but he was not the architect. G. C. HORSLEY has designed a reredos for which oak panelling and painted decoration are required. The "Hall of Residence, University College, Reading," by Mr. C. S. SMITH, presents architecturally several buildings erected round a square with a fine entrance tower. The "National Telephone Exchange, Gerard Street, Soho," by Mr. LEONARD BAKER, is another example of the construction of semi-circular windows on the ground floor, with rectilinear windows on the upper storeys. Mr. O. B. HATCHARD shows from Khartoum a large coloured drawing of a proposed Design for Government Buildings in a "Tropical Climate." Khartoum and other towns in the Sudan are not remarkable for their native architecture, but it is to be feared the English administrators are not exacting about the styles of new official buildings. The design, happily, is not British, but rather it is or not more Indian than Egyptian is open to doubt. The "New Wing to Commercial Travellers' Hotel, Pinner," of which Mr. H. O. CRESWELL is the architect, is we suppose in keeping with other parts. A similar style is adopted and the colour will be subdued and pleasing if it corresponds with the drawing. From Mr. N. N. NELL is an "Entrance Front to House at Exbury." Mr. J. T. LEE'S "Interior of St. Margaret's, London," shows the chancel and parts near it. There are charming glimpses afforded within a confined space, of mouldings, panels and other details are elaborately worked. Mr. DARE BRYAN'S "Proposed Baptist Chapel" is a fine original. Grouped and massive columns are the chief features of the front, but their duty must be to support a small ventilator or a small window. Mr. E. W. ALLFREY has a pleasing "Design for a Library, Southwark," which, like many other designs of its class, had to be adapted to a difficult site.

(To be continued.)

THE SORROW OF CHARLES GARNIER.

DURING a period of forty years—or from the time he gained the great prize in the competition for the Opera House until his death—CHARLES GARNIER was one of the most prominent of the notabilities of Paris. He had all the qualifications for the position. Wealth, family influence and other inherited advantages have their value in France as elsewhere; but since the Revolution the belief in talent having the right to a career has been put in practice among Frenchmen to an extent which no other country in Europe has had the courage to rival.

CHARLES GARNIER was a true *gamin de Paris*. In his prime he could be described in the elder DUMAS'S words as "grand et découplé comme le lutteur antique, musculeux comme un Spartiate." In his youth he must have appeared as eligible to work as a wheelwright like his father. But his mother, having more insight, knew he was not fitted for such toil. She therefore sent him to one of the schools of drawing, and there he showed so much talent he was taken into an architect's office. From it the passage to the Ecole des Beaux-Arts was not difficult, and a young fellow who could design for a variety of businesses was not likely to lack employment. GARNIER was only twenty-three when he gained the Prix de Rome.

For some of the French students Rome is considered to be merely an official stamp of ability. The result is that, seeing how little is gained by such representatives of French art, many wise men advocate the abolition of the Villa Medici. CHARLES GARNIER profited by the example of his humble parents, and he worked as hard as any wheelwright of Paris. On his return he startled critics by the quantity of drawings which he had prepared, not to show his appreciation of ancient work or his competency to assume the position of ICTINUS or any other great architect, but simply to sell to dealers or amateurs. His friend EDMOND ABOUT compared the collection to the varied stock which the better class of Cheap Jacks brought with them to surprise provincial villages, and the artist was said to resemble the *débütantes* of the theatre who display their versatility not only by representing characters, but by singing, dancing, playing, &c. GARNIER was, according to ABOUT, not only endowed with ability, but he appeared to have ubiquity. His views comprised scenes in Rome, Venice, Florence, Pistoia, Genoa, Pompeii, Naples, Sparta and Constantinople. Then, like Maitre JACQUES, he could throw off the painter's blouse and put on the black frock coat of the architect, for in the same exhibition were twelve splendid drawings of restorations of French buildings in the kingdom of Naples, which were intended to serve for a history of the Angevin kings in Sicily.

GARNIER'S merriment was in those days as generally recognised as his skill in designing and drawing. Indeed, without that gift life would have been for a long time at least a burden to him. If ever a man who held the Prix de Rome was justified in expecting that his castles in Spain were to be surpassed by the structures for which he was to receive commissions in France, it was CHARLES GARNIER. But he had to submit to the lot of the dullest prizeman, for in Paris he could find no other employment than in a position corresponding to an English clerk of works. He eked out his pay by an occasional water-colour drawing, and two which were presented to Queen VICTORIA came from his hand. Fortunately for him the Empire, which was then at its zenith, required a memorial, and no form could be discovered which was more characteristic than a grandiose Opera House. The theatricalism of the Imperial system was not in keeping with that of the French classic drama, and the Théâtre Français served well enough for monumentalism. But a theatre in which the audience was intended to be as much a spectacle

as any presented on the stage, and in which all the arts could be combined to honour the *régime*, was as happy a thought as the *coup d'état*, and, as it happened, was more of a success than the conquest of Mexico. To the surprise of all but his young friends, CHARLES GARNIER's designs were unanimously selected in the second competition. The Government had the good sense to be decisive, and the works were commenced after an unusually short interval. GARNIER set about his duties with an impetuosity that could be compared to TINTORETTO's, and a number of artists who had studied with him in Rome and Greece showed their eagerness to loyally co-operate with him. PAUL BAUDRY, who, like GARNIER, had sprung from a humble class, and who might have been the favourite portraitist of the Imperial Court, cheerfully sacrificed not only his prospects, but we may say his life, in order that he might adorn the building of his fellow-prizeman. GUSTAVE BOULANGER, who could easily have rivalled MEISSONIER, preferred to work on a large scale as a wall-painter under GARNIER. The spirit of the time among one class of artists is suggested by the vigour and defiance of the figure of *The Dance* by CARPEAUX. With all the eagerness of artists and workmen the work was not finished when the fatal events of 1870 occurred. But the Republican Government recognised its responsibility, and the Imperial memorial was consummated, as it was commenced, out of the national funds.

Under the Empire GARNIER was too much engrossed with his building to devote the time to play the courtier with success, like VIOLETT-LE-DUC and other artists. He became a more prominent Parisian after the Empire had vanished. Apparently, the French people imagined that he required to have the command of a Treasury for his buildings, and even millionaires hesitated about offering him commissions. However unsatisfactory may be the state of his ledger, an architect is bound to keep up the appearance of success. At a time when less prominent men were flourishing CHARLES GARNIER found long intervals must elapse between the occasions when his unquestioned talents were called into action. Yet he had to assume all the appearances of a favourite of fortune. Not only so, but he was expected to impart joy to those who came near him. He must always be ready to supply impromptu witticisms, to aid in the production of a comedy, to knock off a string of verses, to deliver a speech which would delight as well as instruct. What added to the piquancy of the efforts was the recollection that they came from a man who followed one of the gravest professions. It was no wonder many who enjoyed the pleasure believed that GARNIER was not an architect who was always considering his clients' interests.

During the latter years of his life a more intense sorrow than any arising from limited commissions had to be supported. GARNIER had married a daughter of EMILE BERVY, one of the principal philologists of France. In 1872 a son was born, who early gave promise of extraordinary abilities. In him was also combined a power to undertake serious works with remarkable skill in the combination of fantastic contrasts. CHARLES GARNIER recognised in him a spirit akin to his own. But in course of time he discovered that the seriousness was to be yielded to science rather than to art. CHRISTIAN GARNIER took up the study of languages, and made progress in it as if philology was to be the great business of his life. But the more he studied the more he perceived that geographical nomenclature was in a state unworthy of an advanced age. According to Cardinal NEWMAN, there cannot be a wider, a nobler, a more philosophical subject than geography, especially when it comprises ethnology and any other branch of knowledge which is related to it. CHRISTIAN GARNIER wished to impart to geography a scientific method which hitherto seemed to be foreign to it. He began with place names, and for that purpose he had to give more or less attention to about 120 different languages. That was necessary, for he wished to

bring all the geographical names, however ancient and however savage, under some common law to all of uniformity throughout the globe. It was a colossal undertaking, and would no doubt require the aid of investigators in all lands. But the French Academy of Sciences did not consider the project was ridiculous for they awarded CHRISTIAN GARNIER one of their prizes. A similar prize had been awarded in 1834 to the German LEPSIUS, but the official report declared that the younger GARNIER's system was superior in simplicity and elegance to all preceding proposals on the subject. It was said that it would preserve the name of the author among all those who had interest in geographical studies, and that reputation had been gained at a time when the majority of scholars had scarcely commenced their studies. It adds to the interest of his success that CHRISTIAN GARNIER had been long aware he was doomed to an early death and he resolved to do something to increase knowledge among men before he passed away.

The position of CHARLES GARNIER under these tragic circumstances excites as much pity for him as for his son. He loved CHRISTIAN with the ardour which he showed in many varieties of circumstances. He was aware of his son's impending fate, and he could not endure his absence for a moment. It was necessary that CHRISTIAN GARNIER should live in several places, partly in the hope of obtaining some relief, partly in order to pursue his studies among as many varieties of people as was possible. If he were endowed with health and strength, he would have followed his geographical researches in all parts of the world. CHARLES GARNIER could not endure his son's absence for an hour. Some of his letters have been given to the world by Madame CHARLES GARNIER through the agency of M. PAUL DENIS. And we doubt if in the whole mass of letters that exist there are any so poignant as those to his absent son from the great architect, who was compelled to live amid so many distractions in Paris. We may adapt THACKERAY's words to say, "he can't bear to let go the youth's delicate hand."

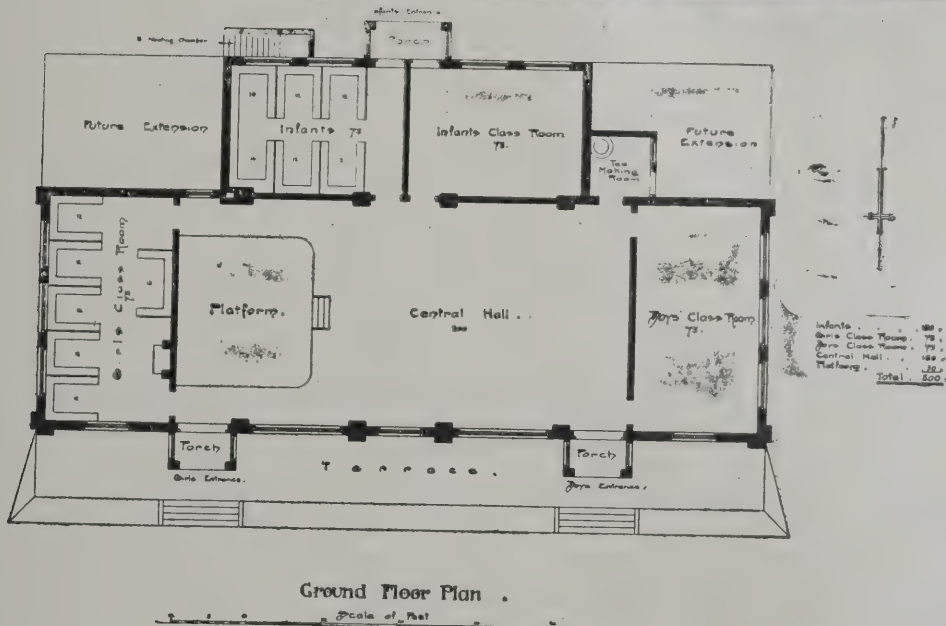

The different moods of the writer are clearly brought before us. As a true artist he could not be without some jealousy of science, and he felt occasionally a little for CHRISTIAN preferred science to his father. At one time he complains of a letter being too geographical and too scientific. Then as a creator himself it pains him to think that his son is pursuing a theory. A single letter a day will not ease the heart of the poor architect. Often he writes two of them. He implores the son to write to him, or if he has not time to send telegrams. Indeed, it is evident from a comparison of their letters that the father suffers infinitely more than the son, although the latter may in his stoicism and to avoid giving pain refrain from a full recital of all he had to bear. As time goes on the anxiety for news increases. The impatient architect follows every stage of his son's journey, consults time tables and postal guides, and indicates the hours when he expects to receive news. When a return to Paris is arranged, there is cessation of misery for the father. He counts the time he tells the son, not only by the days, but by hours and minutes. He that at one time was able to boast of success under various forms appeared to have only one ambition, and that was to say to his friends, "CHRISTIAN was thinking of me two hours ago." Some people who may not have met CHARLES GARNIER would say the French are theatrical even in their grief, and this is merely one example. The fact is the man was endowed with extraordinary energy because the things that weighed on him as if they were alive, and he could not find peace until he had settled all their claims. Paternal affection seized hold of him with such a strength it was impossible for him ever to know what peace was.

The father's trouble appears more bitter from the contrast offered by the letters of CHRISTIAN. In the end we have by a terrible irony a repetition of one phrase:

CHARLES GARNIER's mind and that which was most appreciated by society in Paris. The old *gamin de Paris*, who built opera houses and casinos with joy, knowing that he was aiding in the world's amusement, appears as if transmigrated in the son. CHRISTIAN is dying, and yet in the watering-places, or wherever he is sent in search of a cure, he writes little pieces for the theatres and the music halls, as if in that way he could find the only solace to his pain. In his letters home he bravely avoids suggesting his downward progress—the cry is still "Vive la Bagatelle!"

SUNDAY SCHOOL, ST. GEORGE, READING.

THE proposed building contains, as is shown by the plan, a large central hall and four large classrooms, the object being to subdivide the classes in the classrooms, as shown on plan. The total accommodation is for 500 children, all on the ground floor. The estimated total cost, including the heating, furniture and lighting, is 3,000*l*. The building is in keeping with the church. The architect is Mr. GEO. W. WEBB, F.R.I.B.A., Market Place Chambers, Reading.

CHARLES GARNIER had said he could not witness his son's death; his reason was not strong enough for such a test. He was spared that scene, for his own death preceded his son's by a month. There can be no question the agony he passed through during the absence of CHRISTIAN must have had effect in weakening his constitution. But the circumstances of his death will hereafter impart a pathetic interest to the history of a man whose anxieties as an architect were not able to overcome the affectionate instincts he derived from nature.

THE LATE W. W. ROBERTSON.

A LONG career as an architect and public servant closed with the death of Mr. Walter W. Robertson, formerly of H.M. Office of Works, Parliament Square, Edinburgh, and a former Master of the Edinburgh Merchant Company. For more than twenty years, says the *Scotsman*, Mr. Robertson was principal architect under H.M. Board of Works in Scotland, and although he retired from that office three years ago owing to a slight paralytic stroke, he did some professional work since his retirement, and at the time of his death was consulting architect to the Scottish

Education Department. About the end of October last he had another paralytic stroke, from which he never in any large measure recovered. He resided at Wardie Bank, Boswell Road, Trinity, where his death took place. Born sixty-one years ago, Mr. Robertson received his early professional training under the late Mr. Morham, city architect, Edinburgh, and afterwards he had varied professional experience with the firm of Messrs. Holden & Sons, Manchester. His connection with H.M. Office of Works dates from 1871. In that year he became technical assistant to Sir Douglas Galton, who then occupied a post that has since been abolished—that of H.M. Director of Works. Subsequently Mr. Robertson acted as assistant to Sir John Taylor, one of the architects of the Office of Works. While occupying these posts his work was mainly in London. His services and ability, however, were soon further recognised by his being appointed head of H.M. Office of Works in Scotland. During his tenure of this office he superintended a large amount of important new work in the erection of Government buildings in different parts of Scotland. Among the work carried through while he was principal architect were the erection of Glasgow General Post Office, Glasgow Inland Revenue Office, the Blackford Hill Observatory, Edinburgh; new post offices at Dundee, Inverness, Perth and other towns; the extension of the Royal Scottish Museum, Edinburgh (then called the Industrial Museum); and the extension and alteration of the Register House, Edinburgh. About the end of March 1904, after he had had a paralytic stroke, he gave up his post under the Board of Works. He was a member, and at one time president, of Edinburgh Architectural Association. In the work of some of the other corporate bodies in Edinburgh he took a considerable interest. Joining the Merchant Company in 1883, he passed successively through the offices of assistant and treasurer, and in 1895 was appointed Master of the Company, an office which he filled with acceptance for the usual term of two years. At the close of his term as Master he was presented with his portrait in oil, which has now a place on the walls of the offices of the Company in Hanover Street. In Masonic circles he was well known, as he took an active interest in the affairs of the order, and was at one time R.W.M. of the Lodge of Edinburgh (St. Mary's Chapel), No. 1, which is one of the oldest lodges in the United Kingdom. Mr. Robertson is survived by a widow, four sons and two daughters. Of his sons, two are in Edinburgh—one of them an advocate and the other an architect. Another is a clergyman in London, and the fourth is in the Indian Civil Service.

THE QUANTITY SURVEYORS' ASSOCIATION.

THE annual dinner of the Quantity Surveyors' Association (Incorporated) was held on April 26 at the Criterion Restaurant, W. Mr. A. J. Gate, the president, occupied the chair. Among those present were Messrs. A. A. Hudson, W. Lawrance, H. England, E. J. Hill, G. Gard Pye, J. Chessum, W. Woodward, F. L. Dove, A. W. S. Cross, J. Howard Colls, H. H. Bartlett, W. R. Hood, G. L. Crickmay, H. W. Crickmay, T. Costigan, J. Johnstone, A. G. Cross, C. W. Ball, W. G. Walder, G. J. Clarke, W. Thomas, F. Woodward, C. R. Reekes, A. Huntley, S. Chatfield Clarke, R. J. Tollit, W. Hoffman Wood, H. G. Tarrant, J. G. Mayhew, H. A. A. Gate, J. Aylott, J. Bartlett, D. A. Ross, H. J. West, C. Pearson Shaw, C. Pearson Shaw, jun., H. T. A. Chidgey, R. S. Ayling, H. Riley, H. M. Hodgson, H. J. Camp, H. P. Barber, B. E. Laine Pearson, H. Smith, A. S. Bennion, J. S. Parmenter, R. L. Curtis, jun., W. P. Horsburgh, C. W. Bowles, G. A. Ovitts, C. A. Kennett, P. Bywaters, H. C. Garland, H. C. W. Dodd.

After the loyal toasts had been honoured, Mr. A. A. Hudson proposed "The Quantity Surveyors' Association" and its President. He said he considered it a great honour to be allowed to propose that toast, but he could not refrain from wondering why it was that he had been selected to do it. Possibly the organisers on seeing him had come to the conclusion that he required a good dinner such as he had just had. He had been informed that the Quantity Surveyors' Association was only three years old, and when he saw what a representative gathering had come together on that evening he could only conclude that a very great thing had been achieved. The profession of quantity surveyor is of essential importance to architects, builders and lawyers. It is above all an accurate profession, and the members are accustomed to think in figures. He himself in his legal practice was bound to rely practically entirely

upon them, and that reliance had never been placed in vain. Architects he divided into two classes, viz. artists and business men; very rarely was there a combination of these two characters. He would like to make one or two suggestions to the Association. It seemed to him that its sphere of usefulness might be extended beyond their ordinary present duties. The profession of architecture needed the assistance of a business man, and in his opinion a quantity surveyor will become an indispensable attribute, not only in starting, but during the progress of works—in small works as well as in large contracts. The Association ought to apply itself to the preparation of a building contract which would be perfectly equitable, both to employer and to builder. The existing form does not altogether fulfil these conditions. No one could be better qualified than a quantity surveyor to undertake the task. It would be an enormous boon if a perfectly equitable building contract, based on the quantities, were prepared. We shall have to consider in the future vast changes with regard to the development of property. Whatever might be the reason for the existing slackness in the building trade, he did not doubt that the Association would quickly push their way to the front and take every opportunity to develop it. He might, if time allowed, say a very great deal of Mr. Gate, the president, whom he had known for many years. He would content himself with the statement that the Society had never had a better one. It was inevitable that a new society such as theirs should arouse some opposition and meet with many difficulties.

The President, in response, thanked the company for the manner in which they had received the toast, and congratulated the meeting that, consisting as it did almost entirely of architects, surveyors and builders, so many of them were present and not yet in gaol, as a friend of his, a criminal lawyer, had assured him that modern legislation had already spread its nets for the brains of the country (which he defined as architects, surveyors, builders and betting men), and with proposed Licensing and Land Bills, which would involve landlords who could not get their rent and tenants who would not pay it, brewers, publicans and public, the lawyers would have three-fourths of the population in prison in less than two years, and the rest building extra gaols for their own use when their turn came. As to the Association, it had, as Mr. Hudson said, accomplished a great deal. The Council believed that much had been done. It was not an advertising society; they did not thrust themselves forward; the deliberations of the Council (involving as they did such matters as the rejection of candidates, &c.) were necessarily private, but they believed they had done and were doing work which was and would be of great benefit to the profession generally. When the Association was founded it was not expected to reform everything in a minute or in a year or two, for they were not foolish visionaries but practical men, many of whom had been in the profession thirty or forty years, endeavouring single-handed and to the best of their ability to effect needed reforms. Single-handed they could not do it, but they hoped and thought they could when they became associated together; and they believed that they were now to a great extent stemming what had been going on. They could have achieved more but for a big log in their path; in fact, had there been no Surveyors' Institution there would have been no difficulty at all. Nothing was easier than to keep up motion when it was once obtained, but it was inertia that was difficult to overcome. If they could have got the Institution to act according to its charter, as it should act, all would be well, but it ignored its charter, and that was the great trouble. He was glad to say that their little body of less than 200 members had been able to move to some extent this body of about 6,000 members. The tail had done more than waggle the dog; it had moved the dog on—a doubly difficult task, because if the tail pulled the dog it would be backwards, and the Institution went fast enough in that direction without any assistance, but the small tail had actually pushed the large dog forward. The Council took credit for never having asked for assistance in their task, arduous as they knew it to be, and though sure that architects and builders alike would help if appealed to, the Association felt itself to be strong enough to accomplish what it had to do, and they would not ask others to help them, but would leave time to show that what they were doing was as much for the good of those others as of themselves. They were working for themselves, of course, for the evils they complained about affected them as surveyors; but what they were doing was also for the good of architects and builders, for what was the position

of an architect or builder with a bad quantity surveyor? How many architects had been troubled by their tenders coming to too much, and had known that this was because the quantities were bad? How many builders had had their quantities come to too little and did not know where they were? Architects and builders alike would presently get to understand thoroughly the objects of the Association, and that its members guaranteed the absolute accuracy of their quantities, and agreed to pay in the event of the quantities being wrong without nonsense or prevarication. By Article 13 every member was bound to pay client or contractor for any error in quantities, and should a quantity surveyor with the letters Q.S.A. after his name make his quantities too full or too short, there was no need to trouble a solicitor, who knew very little about such matters, or a counsel, who knew still less, or a judge, who knew nothing at all (witness the case of the judge who gave the decision that if a contractor found that part of something had been left out in a bill of quantities it would be an error, and redress could be obtained, but that if the whole had been omitted, he could not, as that was not an error), and all that need be done was to write to the Council of the Association asking for redress if the quantities were inaccurate. The Council would act at once; there would be no law's delay. The Council, consisting of men who had been in practice for from twenty to forty years, formed the most competent tribunal that could be found to decide such questions. With regard to altering the existing form of contract, they were obliged for the suggestion, as they were for any suggestions which were meant for the good of the profession; but he did not think the time had come to interfere with the existing document. The present form was as fair a contract as could be arranged on the present lines, and he did not think there was any great dissatisfaction with it. Still, he understood Mr. Hudson's point. It was absurd to undertake to execute a building according to the quantities, and surveyors would be the last to wish any building to be so executed, as it would be a bad day for them when they could have no more extras and omissions. He thought when any revision of the present contract form was desired, builders must take the first steps in that matter, and quantity surveyors would be pleased to co-operate. Referring again to the Surveyors' Institution, the President said that that body had had a charter granted them to uphold the status of the profession and to regulate its customs and usages. A number of members of the Association, who were also Fellows of the Institution, called a protest meeting to be held at the Institution premises (under their right to do so) to request the Institution to fix a scale of fair charges and publish it, and stay its Fellows from working at half-price and less. Well, the meeting was held, but not one of the professional journals was represented. Of course, the proposals he and others made were outvoted, but they were able to express their opinions, and they referred to the charter and the abuses of it, and called upon the Institution to remedy the evils, but not one word of that was allowed to be printed in the transactions or notes of the Institution, although the official shorthand writer of the Institution was present. Since then the Institution had issued a circular to public bodies, deprecating competition by quantity surveyors, but they did not issue a scale of charges. The Institution in its circular complained that competition tended to reduce charges and lower the status of the profession; but when a little school to cost about 20,000*l.* was put up to competition a Fellow of the Institution promptly tendered for and took the job at $\frac{1}{2}$ per cent. He wrote to the President and asked him if he would bring the matter before the Council, and the reply he received was to the effect that it was the policy of the Institution to allow its members to charge what they liked. This, from an Institution which had a charter to improve the status of the profession and regulate its practices. He thought that was plainly announcing that the policy of the Institution was to allow its members to go to the deuce and drag the profession with them.

Mr. W. R. Hood, F.S.I., London vice-president, in proposing "The Architects," declared he would have preferred that toast out of all those on the list if he had been asked to make a selection. In thanking architects for attending he would like to say that much mutual assistance was possible between architects and quantity surveyors. The practical relationship between the two was already very close and was one that will grow more and more so. There was need for the two to be kept quite distinct. He could not agree with the suggestion that the Association should set to work

to create a new form of contract. He considered that the present-day architectural education was capable of improvement. The official examinations did not sufficiently foster the artistic side. Therefore he might express a hope that architects no less than quantity surveyors will be raised in the future.

The response was made by Mr. A. W. S. Cross, M.A., who expressed a right to have more than ordinary interest in the work of the Association, from the fact that many years ago he himself had had the audacity to think that he could prepare quantities. His self-satisfaction continued for some time as his work presumably passed muster, for he continued his career with profit to himself. Unfortunately he met his Waterloo when a most captious and critical individual took exception to his quantities. He left the pleasant groves where presumably the being who looks after quantity surveyors resides and took to architecture. He heartily wished the Association success in their efforts, and knew he voiced the feelings of many sympathetic architects in expressing a readiness to render any possible assistance to the Quantity Surveyors' Association.

Mr. H. T. A. Chidgey, in proposing "The Contractors," explained that although the toast came low on their list it was by no means low in their estimation. It was a pleasure to see so many distinguished contractors, and he hoped that on future occasions there would be even a still greater number. Much might be said concerning the interrelations between quantity surveyors and contractors. One of the best friends of the latter was a quantity surveyor. They were well past the days when they considered themselves natural enemies. London has every reason to be proud of her builders and contractors. A builder must be a Napoleon of strategy in addition to possessing other qualities if he is to unite diverse conflicting interests. He has in the first place to win his job against men equally sharp and ready to make concessions as himself. He must satisfy exacting architects. His men are to be kept in continual employment, and there must never be too many of them or too few. He thought that the man who can accomplish all that had thoroughly earned the respect of the community. He took pleasure in the knowledge that many contractors whom he met professionally were on his list of friends.

Mr. Fredk. L. Dove, L.C.C., president of the London Master Builders' Association, emphasised that however lacking his words might be in eloquence they were an endeavour to express the sincerity of his good wishes towards the Quantity Surveyors' Association. He was perpetually puzzled by the expression "jerry-builders," who had no apparent connection with the prophet Jeremiah, unless it were their continual complaints. They were hangers-on to building contractors. However, it was not solely a question of bad builders, but also of a bad public which demands more than they have a right to expect for their money. There are always people ready to supply every sort of demand. Unfortunately such employers exist only to the detriment of thorough building firms, for the irresponsible outsiders force into existence a ruinous competition. Many bills of quantities as supplied at present are conspicuous by their often bewildering brevity rather than for their accuracy. In perfect quantities both these qualities should be found. The preparation of a universal form of conditions of contract had been discussed for many years past *ad nauseam*. A few years ago a form had been agreed upon, and although it was by no means faultless, it gave comparative satisfaction and might well be allowed to stand. If any alteration were necessary it should be effected in the direction of the guarantee exacted. Builders have come to the conclusion that the bond is an unreasonable onus upon them. Experience has shown that the builders stand in no less need of protection against many clients who never pay. They are, indeed, frequently robbed by means of their guarantee of payment.

The toast of "The Visitors" was proposed by Mr. Walter Lawrance, F.S.I., past president of the Quantity Surveyors' Association, and was responded to by Mr. J. Howard Colls.

At the conclusion of the dinner a concert was given under the direction of Mr. Arthur Helmore.

The Stretford Education Committee will apply for sanction to a loan of 3,300*l.* for the extension of the Victoria Park school, Stretford. The architect was instructed also to prepare plans for the erection of an infants' school in Stretford Road.

NOTES AND COMMENTS.

THE late CHARLES EAMES KEMPE, who died on Monday in his seventieth year, held a peculiar position in art. At Lindfield, in Sussex, he was esteemed as a country gentleman who had a hobby in producing windows for churches. In trade circles we are afraid he was looked on as a competitor who adopted irregular methods, and was able to persuade the clergy to consider his commonplace windows as inspirations. There was no doubt his practice was anomalous. But a man who was educated at Rugby, and was an Oxford Master of Arts, was probably justified in following a novel code of commercialism. It is said that in Sussex alone there are over 120 windows in churches which he supplied. Although his name is connected mainly with stained glass he was prepared to supply various other kinds of work on demand.

ACCORDING to the annual report, the members of the Berkshire Archaeological Society still enjoy the privilege of holding the meetings at the Abbey Gate, of which they are the tenants under the Corporation of Reading. For some years past one of the rooms has been occupied by the Central Aid Society. This has now been acquired by the committee, has been furnished and decorated, and is used as the library and secretary's office. During the past year some correspondence has passed with the Corporation concerning the extension of the lease of the Abbey Gate, on the condition that the Society should spend money upon the decoration and restoration of the building. Some difference of opinion was manifested with regard to the amount proposed to be expended and the repairs required, and the negotiations fell through. Hence the committee have reverted to the original annual tenancy. Possibly, at some future period, the matter will be again raised. It is, however, satisfactory that the whole building is now held by the Society, and thanks are due to the Corporation for granting so suitable and convenient a home. Another subject of correspondence with the Corporation had reference to the ceilings of the old house in Minster Street, still in the Society's custody. It was hoped that the Corporation would have erected these ceilings in some part of the new buildings connected with the town hall, but they have abandoned such intention. It would have been satisfactory if those relics of old Reading could have been preserved in the municipal buildings. The Corporation had been approached with reference to further excavations in the Forbury Gardens, for the purpose of investigating the Saxon cemetery. The town clerk writes to say that such excavations in the spring would interfere with the work of the gardeners, and suggests a renewal of the application in the autumn. There were 158 members, and as the expenses will have to be increased, it is desirable that members should endeavour to strengthen the Society by obtaining new members.

THE destruction of buildings in San Francisco was scarcely ended when the criticism of the methods of construction appeared in various journals. The American Society of Civil Engineers acted wisely in seeking evidence before coming to any conclusion on the subject. A general committee and six special committees were appointed to investigate the remains, and the report has been recently issued. Five types of buildings were adopted, viz. (1) wood frame structures; (2) structures with brick, stone or concrete-block walls with timber floors and partitions; (3) structures with brick and stone bearing walls, metal interior frames and fireproof floors; (4) structures with steel frames supporting all wall and floor loads; (5) reinforced concrete structures. A distinction is made between damage by fire and damage by earthquake. There was little damage by the latter to wooden frame buildings. Buildings of masonry with timber suffered most from the shock and the loss of life was greatest in them. The third type of building was more damaged than the

fourth, although the fourth, which included the majority of the tall buildings, became most exposed to earthquake damage. Much depended on the character of the bracing. The damage to steel frames was almost negligible. Reinforced concrete construction is now so generally adopted in American cities, it sounds strange that only a few instances of the type existed, and they were built several years ago. The old portion of the Stanford University Museum, a complete structure, was uninjured except for a few cracks. The connecting brick portion was badly shattered. Roble Hall at the same place, a three-storey and attic structure, was uninjured except where some brick chimneys fell, breaking the roof and floors. The sub-station at Redwood City was uninjured, and a part had to be rebuilt. This structure was built on marshy ground near the bay, and was exposed to the worst effects of the shock. A warehouse in San Francisco in course of construction, with two storeys up, had its brick walls wrecked, but the reinforced concrete frame and floors were uninjured except by the fall of the walls. The floors of the Academy of Sciences and of the Folger Building were uninjured by the shock, and the same is true of the complete reinforced concrete building, three storeys high, in Alameda. The factory buildings and residences were uninjured. All the evidence points to the superiority of this method of construction. The reporters have come to the conclusion that the effect of the earth motion is to set a building moving. The structure is thus subjected to all the stresses occurring in a truss sustaining a live load. The amounts of the stresses are unknown and cannot be predicted, as the intensity of the shock is unknown. Obviously the shock may range from a tremor to that of violence that would wreck any building.

ILLUSTRATIONS.

UNITED UNIVERSITY CLUB, SUFFOLK STREET, FALL MALL, S.W.

THE COMMON HOUSE, WIMBLEDON.
PARKSIDE HOUSE, WIMBLEDON.

THESE buildings have been erected at Wimbledon, overlooking the Common, where it was desirable to introduce the country type of dwelling. The great feature in each case has been the sitting-room hall and the drawing-room, which extend the whole depth of the building. The plans are long and narrow, so that they could have the maximum amount of frontage to the views across the Common, the depth being curtailed accordingly, so that an ample garden could be arranged in the rear. The brickwork generally was in brindle bricks, the walls being rough-cast and the entrance bays of Stamford stone. The half-timber work was in oak, and the tiles were hand-made Broseley tiles. The interiors of the buildings are generally finished in white enamel, with oak panelling in the entrance hall, the floor being laid with red herringbone tiles.

The whole of the work was designed for and carried out by Mr. F. G. MINTER, of Ferry Works, High Street, Putney, under the direction of the architects, Messrs. HUBBARD & MOORE.

HOUSE AT BOVINGDON, HERTS.

THIS house, which is now in course of erection, is situated on a very pleasant site of several acres at Bovingdon, near King's Langley, Herts. The external walls are of hand-made, sand-faced red bricks of varying tint, and the roof will be covered with similar tiles also different somewhat in colour. The window frames, which will be painted white, are to have iron casements and leaded lights. A special feature has been made of the loggia, or out-of-door room, entered from the hall, drawing-room or dining-room. The principal garden front faces south-west and the entrance forecourt north-east, protected by a belt of very fine hollies. A lodge and stabling will probably be built in conjunction with the scheme. Mr. A. TIMBERLAKE, of King's Langley, is the builder, and Mr. WALTER E. HEWITT, A.R.I.B.A., of 22 Buckingham Street, Strand, W.C., the architect.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting of the Association for the present session was held on Friday evening last at premises in Tufton Street, Westminster, Mr. Walter Cave, vice-president, in the chair. Messrs. L. D. Martyn and R. H. Somers-Smith were guest members.

House List, 1907-8.

At the election of officers for the forthcoming session voting papers were received, eight being rejected as invalid. The results were:—President, Mr. Walter Cave. Presidents, Messrs. Arthur Keen and H. Tanner. Council, Messrs. R. S. Balfour, E. Guy Dawber, A. Needham Wilson, Louis Ambler, F. Dare Clapham, W. Curtis, E. W. M. Wonnacott, J. S. Gibson and Sir A. Cunliffe Thomas.

Motion of thanks were passed to the scrutineers of the voting papers, the retiring members of the Council, Messrs. John Mitchell and John Murray, and the School of Design members.

Mr. F. W. SIMON read the following paper, entitled

Liverpool Architecture.

I accepted the invitation of your Council to read a short paper on Liverpool architecture with considerable doubt as to my ability to interest you sufficiently—you who are in daily touch with the works of the leaders of our profession; yet as you have expressed a desire to hear and see something of what Liverpool architects have recently been doing, I feel that you will bear with my shortcomings. The paper deals with modern work and not with that of the past with the works of living architects. Therefore, gentlemen, I must refrain from criticism which may be indulged in over a cigar by the fireside but is not for the public platform, and must leave you to form your own opinions and to proportion praise or blame as you may think fit. I come, therefore, before you to-night more as a showman than as a lecturer, and I shall hope to interest you for a short time by showing a number of photographic views thrown upon a screen by the aid of the lantern, accompanied by a few explanatory remarks. There are a number of working drawings and photographs which have been kindly lent by architects with whose work I shall deal, and which I trust you will find time to glance at on the conclusion of my paper.

Liverpool cannot boast of any buildings of great antiquity, though it is celebrating this year the 700th anniversary of the granting of its city charter. Little seems to have come of this early encouragement, and 250 years ago Liverpool was still little more than a village on the banks of the Mersey. Yet now Liverpool has its architectural reputation, and I should like briefly to refer to a few of the old buildings. The Town Hall is the oldest public building in Liverpool. It was erected in 1756 from designs by William Wood, of Bath. The interior was destroyed by fire in 1895, and was reconstructed, and the dome was added at the same time. The reception-rooms, which occupy the top floor, form a very fine suite treated in the Adam style perhaps a little later, and they still contain the furniture of the period. Then we have St. George's Hall, which has been described as the finest building in the world—at any rate, Liverpool people like to think it so. As a matter of fact this remark is attributed to Mr. Norman Shaw. As you all know, it was erected from designs by Elmes, between the years 1838 and 1854. Harvey Lonsdale Elmes was only twenty-four years old when he was awarded the premium in the competition which was held for this building, and we, the present generation of architects, congratulate ourselves that, though so young, he was entrusted with this important work. I will not enter into a further detailed description of this noble building, which was completed after Elmes's untimely death by Mr. R. Cockerell. Without doubt St. George's Hall has had great influence in creating among the Liverpool architects and the Liverpool public a respect and a desire for noble and stately architecture. The interior does not appear to me to be as successful as the exterior. The building, in Paris, to which it may be compared, is much more so. It is also spoilt by the present colour decorations and the gaudy stained-glass windows. At the back, or rather to the west front of St. George's Hall, the Corporation have recently laid out what they are pleased to call a garden of municipal bungling. I trust poor Elmes does not know about it, for the repose of his soul would be sadly disturbed. Don't miss seeing this if ever you go to Liver-

pool. Mr. Cockerell also designed the Bank of England, in Castle Street, a building of great dignity and refined detail combined with great vigour and originality. This building I can recommend to students for careful study, and may I suggest that it would be of high educational value for some student to measure and publish in book form Cockerell's more important works?

The Classical tradition created by St. George's Hall was continued in the designs of the Picton Reading-room or Rotunda, erected in 1860 from the designs of Mr. Thomas Allom; the Walker Art Gallery, in 1874, from the designs of Messrs. Cornelius Sherlock and H. H. Vale; then the Brown Library and Museum; and, finally, the Technical Schools and Museum extension, by Mr. Mountford. The Municipal Buildings, in Dale Street, which were opened in 1867, were designed by Mr. Robson. The Government Offices, in Victoria Street, is a simple building with its detail carefully thought out. Opposite this is the Post Office, a picturesque design in the French Renaissance style, by Sir Henry Tanner. Behind the Town Hall are the Exchange buildings, enclosing a large space which goes by the name of "The Flags," where the merchants and business men of the city are wont to congregate. It wears now a rather deserted appearance, owing to the removal of the cotton brokers to their new Exchange. The Exchange Buildings were designed by Sir Digby Wyatt. The University is an important work designed by the late Mr. Alfred Waterhouse, and another important building which belongs to old Liverpool and which I had almost forgotten is the Custom House.

Now we come to a group of buildings on which I will dwell, perhaps, a little longer, believing that it is to these more especially that your attention has been recently directed and which have led you to express the wish to hear and see something of recent Liverpool architecture. I will mention first the head offices of the White Star Steamship Company. You will recognise Mr. Norman Shaw as the author of this building. It reminds one at once of his design for New Scotland Yard. Like it the two lower storeys are faced with granite and the upper storeys are treated in brick with stone bands and dressings. Mr. J. Francis Doyle, of Liverpool, was associated with Mr. Shaw in the designing and construction of this building. The design arrests one's attention by reason of its boldness and its able detail. Will it be heresy if I throw a doubt upon this treatment of a lofty city building? The charm of great gables and ample roofs is convincing in the fine old tithe-barns of England and the long, low cloth-halls of Flanders, but are they right when applied to a lofty city building? Yet the genius of Norman Shaw should surely be a sufficient guide in this matter. Another of Mr. Shaw's works is Parr's Bank, in Castle Street, carried out in conjunction with Messrs. Willinck & Thicknesse, which, with its simple and beautifully proportioned fenestration, comes as a delightful relief from the surrounding work, where every storey has a fresh motive and every window a fresh type of embellishment. Here, again, the lower storeys are in granite and the upper walls are faced with marble with grey bands. This is an experiment and we have yet to see how marble stands in a Liverpool climate. The window dressings and cornice are in terra-cotta. Messrs. Willinck & Thicknesse have kindly lent me a large number of photographs. My next subject is the head office of the Royal Insurance Company, the work of Mr. J. Francis Doyle. I think we may say that Mr. Shaw's influence is apparent in the design of this building. Mr. Doyle has kindly lent me a full set of one-eighth scale working plans. They merit most careful study, as do also his details of the interior and the steel construction. It was the wish of the directors that the large general office, which occupies the full width of the building on the ground floor, should be unobstructed by columns, and Mr. Doyle devised a very clever form of construction to achieve this and to get rid of the deep girders which would have been necessary for a span of 50 feet in order to carry the great weight of the corridor walls and double chimney-shafts of the upper floors. The steel construction is quite independent of the walls. The steel stanchions rise from the sub-basement to the wall head. On the third floor they are connected by arched steel girders, 34 feet apart, and from these girders the first and second floor tie beams are suspended. These girders are hidden in the thickness of the double chimney-breasts, and it is interesting to note that each chimney-stack weighs over 620 tons. Mr. Doyle is to be congratulated on this able and novel solution of a very difficult problem and also on the production of one of the finest buildings in Liver-

pool. The lower storey is faced with granite, the remainder of the walls are faced with Portland stone. The sculptured work was executed by Mr. C. J. Allen, of Liverpool. The board-room is panelled in walnut, and from the ceiling are suspended some fine old Dutch candelabra. Mr. Doyle is also responsible for the Bank of Liverpool, Moss Street branch, and the North and South Wales Bank, Bold Street branch, and the one-eighth scale working plans of these two banks are exhibited.

The largest building recently erected in Liverpool is the new Mersey Dock and Harbour Board offices. The Dock Board, you may be aware, controls and regulates the Mersey port, with its enormous traffic and its acres of docks, and I believe I am right in saying that the traffic which enters and leaves the port of Liverpool exceeds in tonnage that of London, Glasgow, and several other ports added together. With the growth of the port it was found necessary to centralise and provide more accommodation for the ever-increasing staff, and so the Dock Board determined to erect a building ample and spacious, a visible expression of its powers and influence. We may congratulate Messrs. Briggs & Wolstenholme, Mr. F. B. Hobbs and Mr. Arnold Thorneley on the fine building they have designed and carried to a successful completion. Unfortunately, I cannot show many photographs of this building as it has only just been completed and is not yet opened. But the architects have been most kind, and have lent me a set of eighth scale working plans, some large half-inch scales of the dome, and also drawings of the steel construction and a full size drawing of the large cornice. A study of these drawings will give you a fair idea of the building. This building occupies the southern portion of one of the finest building sites in Liverpool, namely, the site of the old St. George's Dock, and it faces the landing-stage and the river.

Two streets have been carried across the old dock, dividing it into three portions. A little consideration and forethought and the Dock Board would have reserved for themselves the central block and made their own building with its dome the central feature, reserving to themselves the control of the sites on either side; but they do not seem to have thought of this, and disposed of the other two sites without restrictions, and on one is to be erected a building with its main cornice 130 or 140 feet above the street level, whereas the cornice of the Dock Board offices is only 70 feet. Thus the opportunity for carrying out a fine architectural scheme has been lost. This building has many points of interest, both in plan, design and construction. It is raised on concrete arches and piers, which are founded on the solid rock at the bottom of the old dock some 30 feet below the street level. No use is made of the space below the basement floor, which is some 7 or 8 feet below the street, and is covered with a layer of asphalt to keep down the tide which at times is said to rise in the old dock. The main feature of the plan is the large central hall with its radiating corridors which give access to the various departments. This hall is carried through every storey with surrounding galleries, and finds its architectural expression in the dome which crowns the building. This dome is 50 feet in diameter at the drum, and the finial is 220 feet above the street level. You will be able to study the construction of this dome from the architects' detailed drawings, but I might explain that the stonework of the drum is supported on a steel structure formed of composite steel stanchions, three at each octagonal angle, so placed as to form a triangle on plan and braced horizontally at each floor level. These stanchions are carried down to a concrete bed with a steel grillage, placed on a foundation of blue brick, which in its turn rests upon the concrete piers mentioned before. The steel stanchions are encased in breeze cement concrete, which helps to stiffen the metal, renders it fire-resisting and preserves it from decay. The outer dome is also framed up in steel with a 6-inch thickness of breeze concrete, in which is embedded a layer of strong expanded metal sheeting, wood plugs are let into the concrete and to this the copper covering is attached. Portland stone has been used throughout for the exterior; the lower portion of the central hall is lined with marble, and the upper portion, for the sake of economy, has had to be carried out in plaster. The total cost has been about 300,000*l.*, and the architects tell me that they have persuaded the directors of the Dock Board to agree that 5,000*l.* be added to the contract to cover all extras, and that there shall be no remeasurement whatever. I think in this they have shown almost as much skill in their diplomacy as in the architecture. Colonial House, the headquarters of the Elder-Dempster Steamship Company,

is another important building by Messrs. Briggs, Wolstenholme, Hobbs & Thorneley. The one-eighth scale plans exhibited in the room and from them you will see that plan is a simple and effective solution of a problem which must occur from time to time. The exterior is faced with Cefn stone and has a base of red polished granite. The shafts of the large columns on the upper floor are also red granite. The new Blue Coat Hospital or School is another work by the same firm of architects, and again they have kindly lent me their plans. I will not detain you by a long description of them, except to remark that it is a charity foundation for resident poor boys, and so lies rather outside the usual type of school buildings. The school chapel is particularly interesting.

The next building is the new Cotton Exchange by Messrs. Matear & Simon. The cotton trade is one of the most important in Liverpool. Formerly it was carried on in an open air on "The Flags" behind the Town Hall. The room was acquired in which to meet and do business under shelter, and this also soon proved inadequate, and a new and larger Exchange became a necessity. The problem had to solve was to provide a large, spacious, well lighted and ventilated exchange-room, with numerous telephone boxes, cable-rooms, post office and telegraph office, smoking and reading-room for the members of the Association, board-room, secretary's suite, bank and clearing house, arbitration and appeal rooms, and as many offices to let as possible. This building stands on an island site, 355 feet long by 145 feet wide, and the main front faces south-west. It is essential that a cotton office or sale-room should face north, north-west, or north-east, as a steady sunless light is required in order to judge accurately the nature and value of the cotton staple. We took advantage of this requirement, and placed our sale-rooms and offices to let to the back—namely, north-west and north-east—and brought the exchange hall right to the front, and so found ourselves in the happy position of having to design a façade untrammelled by the usual window requirements. The plan generally laid out at 10-feet centres, both latitudinally and longitudinally. This greatly facilitated the setting out, and provided, so to speak, a module for the whole building, and has, I believe, helped in a great measure to secure a unity of scheme and effect. I might also mention that the clear area in the centre between the columns measures 103 feet long by 73 feet wide, the longer side being equal to the diameter of the square of the shorter side. It may interest some of the younger students to know that this proportion is that of many of the Italian patios, and that it provides a constant ratio between the two sides, making a subdivision into equal spaces easy. Portland stone is used both externally and internally, the columns in the great hall are monoliths of Royal Pearl Norwegian granite with blue Belge marble caps and bases, and I may say that these columns form an integral part of the structure. The walls of the entrance porches are lined with Italian mazzano, and this material was used also for the large door architraves and the chimney-pieces. The north-west elevation is constructed entirely of steel encased with cast-iron. This form of construction was adopted in order to reduce the divisions between the windows to a minimum, for it is a great drawback in a cotton sale-room to have broad shadows cast upon the cotton samples which are spread out for inspection on the counter below the windows. The wall panelling and doors of the big hall are in mahogany. The smoke and reading rooms are in walnut, and the board-room and ante-room in oak. The chimney-piece in the board-room is in mazzano. The drawings which I have brought are not as complete as one could have wished, but owing to the great speed with which this building was carried out all unnecessary labour and repetition and elaboration of the drawings had to be avoided; for the contractors, with a bonus or a penalty of 2*l.* a week in view, were like hungry wolves howling for information. I have prepared for this paper a half-inch scale detail of a portion of the front. The drawings were not given in this form to the contractors, but in small sections. There is also a full-sized detail of the cornice, the capital, base and pedestal of the large Ionic arcade of the front. It may be mentioned that I increased the cornice beyond the proportion it usually holds in relation to the frieze and the architrave. This was done to allow the entablature generally to tell more effectively in relation to the whole façade. It may be interesting to you to know that this building, costing over 200,000*l.* and carried in some cases 30 feet deep into the solid rock, was erected, completed, opened and fully occupied in eighteen months, and that the contractors of the Waring White Building Company gained a bonus.

Whether we shall get any commission on this still remains to be seen.

My survey of Liverpool buildings might be prolonged indefinitely, but I feel that I am perhaps nearing the fulfilment of your desires, and that you have a sufficient indication of the more recent development of our art in Liverpool. Before closing, however, may I refer very briefly to a few works of ecclesiastical and domestic character. Foremost is the new cathedral. It has still to be built, but the architect, Mr. Gilbert Scott, has kindly lent me a few drawings, which are exhibited on the walls. You are no doubt familiar with his beautiful and original design, and agree with me that Mr. Scott is to be congratulated on having achieved such great success so early in his career. I will no doubt bring his work to a successful issue, and future generations will couple his name with that of James, the youthful designer of St. George's Hall. St. Agnes Church is by the late George Edmund Street. The charming vicarage was designed by Mr. Norman Shaw. Quite near to St. Agnes Church is the church of St. Clare, a very beautiful work by Mr. Leonard Stokes, who has kindly lent me some drawings. Then we have the important church on Mossy Hill, which is such a conspicuous landmark as one approaches Liverpool by the London and North-Western Railway. It is by Messrs. Austen & Paley, who have kindly lent me some photographs which do not do the design justice. Messrs. Austen & Paley are also responsible for the parish church at Waterhouse. Mr. Percy Scott Worthington has lent me some drawings of his church hall in the Ullet Road, which is a charming piece of work, and to Mr. W. D. Caröe I am obliged for the loan of the drawings for his interesting designs in brick of the Swedish Church, in which he has so cleverly expressed the Scandinavian nationality.

With the domestic architecture of Liverpool and its neighbourhood it is hardly possible to deal in this paper. I have a few photographs of an interesting house at Hoylake by Messrs. Woolfall & Eccles, which they have kindly lent me. Dawpool, Mr. Ismay's house, by Mr. Norman Shaw, is well known to you, and possibly also the house on Aldston Hill, designed for Mr. Hudson by Messrs. Grayson & Gould, reminiscent of Little Moreton Hall and other fine old half-timber houses in Cheshire. Finally, I must not forget to mention the industrial village of Port Sunlight.

In conclusion, I would thank you, gentlemen, for your patient hearing. I would express my apologies and regrets to those architects whose work I have not had time to refer to and my heartiest thanks to those who have come so generously to my aid with their drawings and photographs.

Mr. E. GUY DAWBER, who proposed a vote of thanks to the author, said the paper was one of the most interesting delivered during the session. It was a departure from the usual fortnightly paper, because it dealt with the work of a large city which they in London were not acquainted with, and the lecture therefore suggested a precedent for other papers which could describe the various large cities. For instance, said Mr. Dawber, they might have Birmingham, with its many old buildings, and there were many other cities the description of which would afford interesting evenings. The photographs of the buildings were excellent, and as they were shown through the lantern one could easily believe himself to be in Liverpool. He happened to know the city very well. It was a significant fact for Liverpool, the speaker thought, that both Elmes and Gilbert Scott, quite young men, should have had the opportunity of doing what must be considered some of the finest work in this country, if not in the world. With regard to St. George's Hall, he thought it was a calamity that the "Stone-workers' Yard" should have been allowed on the adjacent land. On a site behind St. George's Hall the ground had been cut up with stone walls and balustrades without any attempt at design, and in the worst type of *l'art nouveau*. Mr. Dawber was sure there were a great many sculptors who had put work in that "Stone-workers' Yard" without knowing how it was to be surrounded. The beautiful work of Goscombe John was quite spoilt in that respect. Mr. Dawber knew no town or city which showed so much the influence of Mr. Norman Shaw as Liverpool, and it was found in commercial offices and in the smaller buildings. In the Bank, in Castle Street, the speaker cited as almost reaching his ideal of a dignified street front. Whether the marble facings would be a success and whether the stone surface would last time alone could show. The Cotton Exchange was an excellent example of modern work, and they could congratulate Mr. Simon on carrying out such a magnificent building within so short a space of time.

Mr. W. CURTIS GREEN seconded the vote of thanks, and said he had always regarded Liverpool with especial affection and admiration. To him Liverpool always seemed to be in the forefront of educational matters, and in the general class of buildings, both public and private. It would also seem to be a successful place for young men.

Mr. H. H. STATHAM said that, as an old Liverpool man, he was sincerely interested in the paper. St. George's Hall was his first impression of architecture when a child, and he entirely agreed with the opinion quoted in Mr. Simon's paper, that it was one of the finest buildings in the world, allowing Greek architecture to be suitable to the English climate.

Messrs. E. W. M. Wonnacott, Louis Ambler, A. Keen and the Chairman also expressed their thanks to the author of the paper.

EDINBURGH ARCHITECTURAL ASSOCIATION.

AT the annual general meeting held on April 24 the following office bearers were elected for the session 1907-8:—*President*, Hippolyte J. Blanc, R.S.A.; *Past President*, H. O. Tarbolton, F.R.I.B.A.; *Vice-Presidents*, W. T. Oldrieve, F.S.I., F.R.I.B.A., John McIntyre; *Hon. Secretary*, Colin B. Cownie; *Hon. Treasurer*, W. Glassford Walker, C.A.; *Hon. Librarian*, John Watson, F.R.I.B.A.; *Hon. Assistant Librarian*, Jas. A. Arnott.

Messrs. Alfred Greig, A. Hunter Crawford, F.R.I.B.A., and Victor D. Horsburgh, A.R.I.B.A., were appointed members of the committee of management.

The prizes in students' design competitions were awarded as follows:—*Design for a Bank*—(1) D. M. Kinross, prize of 5*l.* 5*s.*; (2) T. Linton, 1*l.* 1*s.* *Design for a Porch*—(1) S. G. Follett, 3*l.* 3*s.*; (2) W. S. Walter Todd, 1*l.* 1*s.* *Design for a Board-room*—(1) A. W. Graham Brown, 3*l.* 3*s.*; (2) T. J. Beveridge, 1*l.* 1*s.*

Mr. Blanc delivered an address on "Holyrood Chapel and Restoration." Before entering on it he referred to the death of Mr. W. W. Robertson, formerly of H.M. Office of Works, and a past president of the Association. Perhaps no more complete or concise monograph of Holyrood chapel and palace had appeared than that from his pen, printed in the Transactions of the Association. It was agreed that an excerpt from the minutes be sent to Mr. Robertson's relatives. Mr. Blanc described in detail the present condition of the chapel, and explaining the architectural characteristics of Scottish abbeys and cathedrals showed plans of two English abbeys—Hayles, in Gloucester, and Halesowen, in Worcester—which he believed were somewhat similar to what Holyrood was. Beginning with the oldest part of the chapel, the Norman door, he proceeded south, and illustrated several bays of the cloister, and afterwards showed south-eastern and northern views of the edifice. Photographs of some old prints of the chapel were next shown, and then details of the tower and of several of the bays in the north aisle. Other views included photographs of the interior, sections of the north aisle as seen from the gallery at the west end, and the south wall of the nave, which is 4½ feet thick. In connection with the south wall of the nave, Mr. Blanc showed the deviation from the straight line which occurred when the roof gave way in 1768. That deviation, he explained, is about 14 inches, and was caused by the fall of the mass of masonry which formed the roof. Mr. Blanc, illustrating the south aisle, explained the changes of architectural style expressed in that aisle, and traced the change from the semicircular to the pointed arch. Reproductions were given of a drawing by Kemp, the architect of the Scott Monument, showing a suggested restoration of the interior of the abbey, and of a print of about the date 1687, showing the chapel fitted up as a chapel for the Knights of the Thistle. While not entering into any questions connected with the proposed restoration of the chapel, Mr. Blanc, in directing attention to the beauty and interestingness of the details of the chapel as it now stands, said that if any restoration were undertaken strict care ought, he thought, to be taken to leave the existing features undisturbed. On the motion of Mr. G. S. Aitken, seconded by Mr. Thomas Ross and supported by Professor Cooper, Mr. Blanc was accorded a vote of thanks.

"La Construction Moderne" has published illustrations of the new War Office, Whitehall, in the numbers for April 20 and 27. The building is described as one of the most remarkable in London.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

THE annual meeting of the Devon and Exeter Architectural Society was held at Torquay on April 20, the president, Mr. Harbottle Reed, F.R.I.B.A., of Exeter, being in the chair. The hon. secretary, Mr. Allan J. Pinn, presented the report. The number of members was 95.

Many meetings have been held. Among the subjects discussed at meetings were "The suggestions of the registration sub-committee embodied in a circular issued by the R.I.B.A. in reference to the important question of registration of architects," and also from the charter revision committee with reference to the alteration of the R.I.B.A. charter.

A well-attended meeting was held at the College Hall, Exeter, to listen to papers given by Mr. A. W. S. Cross, M.A., F.R.I.B.A., and Mr. G. Hubbard, F.S.A., F.R.I.B.A., upon the subject of "The Revision of the Charter of the Royal Institute of British Architects." As a result of the discussion the following resolution was passed:—"That this meeting of the Devon and Exeter Architectural Society, cordially approving the general principle of the resolution respecting the statutory qualification of architects carried at the general meeting of the R.I.B.A., April 3, 1906, strongly urges the Council to give effect thereto." The papers read were:—"Is a National Style in Architecture Desirable?" by Mr. C. J. Tait, F.R.I.B.A.; "A Brief Account of the City of Cairo, from the Arab Conquest of Egypt in A.D. 640, until the Othman Conquest in 1507," illustrated with lantern slides by Mr. C. King, F.R.I.B.A.

The Three Towns' branch report that during the past year many meetings have been held in connection with the amendments to the Plymouth building by-laws, and whilst regretting that their suggestions have not been adopted *in toto* by the Council, they are satisfied that many valuable improvements to the old code have been effected, to the advantage of the business property in the heart of the town and to the advantage of public health.

Mr. Harbottle Reed delivered the following address:—He said it seems to be the custom that the retiring President should in some way refer to his past year of office, but as the report has covered the doings of our Society it will be unnecessary for me to enlarge upon its generally satisfactory character. Much useful work has been done and some instructive papers read. True, we have not all lived up to our advantages, especially the younger members.

I have to express my thanks to those Fellows and Associates who were good enough to vote for my election on the Council of the Royal Institute of British Architects, and as your representative I have attended several meetings at the Institute when matters of local as well as general interest have been brought forward. It appears evident that the provinces are to have due consideration in the affairs of the Institute. The principle of statutory qualification having now been adopted, the committee is framing a measure to render it operative; the suggested provisions will probably appeal to us according to the varying standpoint whether we view them as aiding the advancement of architecture or the protection of the practitioner.

The most important event of the year was the seventh International Congress of Architects, which at your desire I attended in London. The meetings were of a most successful character owing to their perfect organisation. It is sometimes objected that in functions of this nature the picnic element is a large factor. Well, let us hope it will continue to be so if it fosters the spirit with which we regard—shall I say used to regard?—picnics as being opportunities for friendly intercourse and pleasure. The Congress has, however, its serious side with a full complement of papers and discussions. Vienna will be the next place of meeting in 1908. I have been asked by one of our members who attended that in London to draw attention to the importance of these cosmopolitan concourses of art, where some of the most eminent architects of the day from all the world over meet in common council, and such fraternisation must surely aid the amity of nations, while increasing the knowledge of our great art. Perhaps our friend had an idea that we might arrange a little party to attend and show that when anything is going on Devon must not be left out in the cold.

Among the great competitions that of The Hague Palace of Peace has caused some discord, and it is to be hoped that the international competition for the London County Hall will have a more satisfactory outcome. Locally it is not altogether surprising that the Dartmouth Municipal Buildings competition, in which our members refrained

from taking part on account of the objectionable condition has resulted in trouble. Promoters of competitions for public buildings, especially in the interests of the payers, ought not to issue conditions which cannot be accepted by architects of standing.

May I offer a few remarks upon some matters which, although they have a direct bearing upon our work, are of a very general nature, and therefore the business of no one in particular. The setting and environment of buildings does not always receive the consideration it deserves, it may be, for many reasons. In this respect the student who builds castles in the air—elaborate structures not destined to materialise—has the happiest time, being utterly free to picture his imaginary erection in harmony with its surroundings, or rather with facile pen and brush he puts in a setting to suit, but in actual practice few architects have the opportunities of Napoleon's architect. We can expect to be called upon to design palatial avenues, but nothing be done towards a more comprehensive and dignified treatment of towns? We talk loudly of Imperial ideas, but the average English town demonstrates most clearly that it is a mere aggregation of units, each only caring for itself, with something to buy or something to sell, but rarely anything to give for the good of the community unless some immediate return is assured. The more patriotic temperament provided the unmatched buildings of the Greeks, who knew something of the joy of life beautiful. We are content with more sordid surroundings so long as life is made easy and pleasures unlimited.

True, there is an attractiveness in the name Garden City which deservedly is occupying the attention of those interested in the housing question. The idea seems very delightful and much to be desired; but is it necessary to go so far afield and begin new cities? Would it not be better to realise what we have in some of our large towns? Take Exeter, for instance. Within the last few years a speculating builder has accomplished a great deal towards destroying its natural beauty at the expense of charming residences and open grounds, some of an ornate description.

The approaches by rail to our cities are often of the most appalling description, endless back yards in various states of disorder or dilapidation. It is not a necessity that the backs of houses should always face the railway, where it is so something might be done in co-operation with the companies to effect the planting of suitable trees, especially with electrification of the lines looming in the distance, which will remove the smoke evil. The London and South-Western have themselves done something in the way of planting. Then the approaches by highway with the advent of the motor car, reviving their old importance, after it had passed to the railroad, and let us hope fresh enactments will be provided. At present in many towns the highways are being defiled by the endless motility of the jerry-builder, who crowds his house fronts as close to the footpath as possible. It would be to the interests of the community if these main roads were made 50 feet wide in place of the by-law 36 feet, and space would then be obtained in which trees could be grown. Further, if it were too much to expect that small cottage rows should not be erected on the main arteries, at least owners must be compelled to keep back 10 feet from the path, and should be made impossible to allow the rear of small houses to be placed as in Cowley Road. Another revision of the by-laws might tend in this direction, for it is quite unnecessary to have all the side streets, which are crossed by their residents or those who supply them, 36 feet wide. By all means keep the same distance between the building lines, but a road of 28 feet would suffice, and the extra 4 feet in each front garden would make it worth attention.

It should also be obligatory to provide a certain rational open space for planting or grass, and a ground landlord should not be permitted to lay out an estate for several hundred houses without such open space. This may seem Utopian, but my next point is more so, and possibly the evil I refer to is felt more keenly in Exeter than at Plymouth. It is the irreparable damage which is being done by the speculating builder to the residential quarters where houses of a good class, having pleasure grounds attached, are being confronted by rows of very low-rental houses. Freehold land has its disadvantages, but there should be some means of preventing certain parts of towns which are admittedly occupied by superior residential property from being ruined by the incursions of the jerry-builder. Special areas must well be defined where small houses should not be erected.

Even our monumental erections often lack open space or elevation of floor-line not due to the architect. One of the most telling features of the Brussels law courts is the magnificent position. Conversely, the want of a basement is a distinct loss to the new civic buildings at Cardiff.

Plymouth has a fine Guildhall square and an unequalled open space on the Hoe, but it is rare indeed to find in our English towns the open market-place of continental cities, surrounded by noble piles of buildings. A unique site for a monumental building was afforded by the removal of the old houses near Exe Bridge; the opportunity has been lost, and shops of a very commonplace type cover it with their back entrances on the new boulevard. Someone was inquiring recently, after the laying of a foundation of a building which at the time was up to the first-floor level, why the names of so many officials appeared on it? I think foundation-stones are very useful; they generally vary in size according to the lack of beauty in the building, and it is right that future citizens should know who were responsible for the perpetration of such erections. But there are other inscriptions which destroy all sense of proportion of façades and should be brought within the scope of by-laws. I allude to the disfiguring large-letter signs. What with these and sky-signs, not to mention the tramway standards, our streets are losing all sense of proportion.

So much for some of the externals, and as I may be expected to refer to our aims, may I quote Sir Joshua Reynolds:—"The value and rank of every art is in proportion to the mental labour employed in it, or the mental pleasure produced by it. As the principle is observed or neglected, our profession becomes either a literal art or a mechanical trade. In the hands of one man it makes the highest pretensions, as it is addressed to the noblest faculties. In those of another it is reduced to a mere matter of ornament." To the general public the latter appeals more readily. That the general public is taking a growing interest in matters of art is undoubted, but it is evidently an acquired taste, and requires an enormous amount of stimulating before the due appreciation of architectural efforts will become a matter of course. There is a proposal to include its study at the older universities, and steps are being taken to obtain its recognition in the arts of the new London College. Still, if the public do not evince a warm interest in modern buildings it may be excusable, for the ordinary work is rarely attractive. It is said, "The great end of art is to strike the imagination," and any work which does so is likely to command attention, yet you daily face miles of streets utterly devoid of beauty, with buildings whose crude and misplaced ornament cannot result in mental pleasure of the smallest degree. It may be, gentlemen, that we are not altogether blameless; we are forced to devote so much attention to the more utilitarian side that we abandon as hopeless attempts to strive for real beauty of form, and are fain to obscure with redundancy of ornament the absence of design.

At the conclusion a hearty vote of thanks was proposed by Mr. C. Cole, seconded by Mr. N. G. Bridgman and carried unanimously.

Mr. Harbottle Reed proposed Mr. M. Alton Bazeley (Plymouth) as president for the ensuing year. It was seconded by Mr. C. Cole and supported by Mr. B. P. Shires, and was carried.

Mr. Bazeley, in returning thanks for the honour conferred on him, said he would endeavour to keep up the dignity of the chair and advance the interests of the Society as his predecessors had done before him.

Mr. C. Ralling, of Exeter, was elected vice-president; Mr. Allan J. Pinn, A.R.I.B.A., of Exeter, hon. secretary; Mr. S. Dobell (Exeter), hon. treasurer; and Messrs. J. Crocker, F.R.I.B.A., J. Jerman, F.R.I.B.A., J. A. Lucas, A.R.I.B.A. (Exeter), and O. B. Peters, F.R.I.B.A. (Launceston), were elected to fill vacancies on the Council.

The Bombay Memorial of the recent tour of the Prince and Princess of Wales in India is to take the form of a museum of the products and industries, the art and archaeology, and the natural history of Western India. The Government of Bombay have approved the proposal of a special committee that the building for art and archaeology should first be taken in hand, other portions of the scheme being postponed for a time. The President of the Royal Institute of British Architects is to be requested to select four gentlemen of repute in the profession who would be willing to submit designs at a premium of 100*l.* each, and a like amount is to be paid to the authors of the two best designs prepared in India and sent in competitively

ARTS IN HUNGARY.*

A PASSIONATE love for art as well as for music is the birthright of every Hungarian. Right from the very earliest ages there were signs of great artistic taste and display amongst the Hungarians. St. Stephen, the founder of the Hungarian kingdom and the introducer of Christianity into Hungary in the year 1000, had done a great deal during his forty years' reign to encourage the arts and sciences of the country. He founded numerous bishoprics, abbeys and churches, both at home and abroad, the walls of which were adorned by the finest frescoes of the time.

Amongst his immediate successors St. Ladislaus (1077-95), the brave and chivalrous king, proved also a true patron of the arts, likewise his successor Kolomon (1095-1114), the conqueror of Dalmatia. The last-named monarch, owing to his great learning and scientific attainments, was commonly known as the "Book King."

That enlightened ruler Andrew II. (1205-35), who granted to Hungary in the year 1222 the "Golden Bull" or the Magna Charta of Hungary, a few years after the charter was granted to England by King John, was also a great patron of the arts. Upon his return from Jerusalem as the leader of the Crusaders he devoted a great deal of time to the reorganisation of the State, and likewise to the encouragement of arts and science.

Unfortunately, owing to various internal troubles and strifes, but principally as the result of the Mongol invasion, the art treasures of the country perished and its edifices were reduced to ruins, and the cathedral of Pécs alone bears witness to the high development of the artistic taste and splendour of that period.

The basilica of Esztergom, built in the twelfth century, may also be considered of great artistic value, whilst the renowned church of Ják, with its noble porch, and the church of Lebény, and a number of other churches are rightly famed in the history of art.

It may be of interest to point out here that in those days the principal churches were erected right in the interior of the country, far away from any city, and these churches were so constructed as also to answer the purpose of places of refuge and defence against the repeated invasions of the Mongol hordes and other tribes, and these circumstances no doubt accounted for the fact that most of the churches belonging to this period were destroyed during the country's struggles.

With the accession to the throne of Charles Robert of the house of Anjou (1308) the Italian renaissance art was introduced into Hungary, both by Charles Robert and during the long reign of his son Louis the Great, and for the next two centuries art and science prospered throughout the land.

We have only to look at one of those volumes belonging to the famous collection of King Matthias (1458-90) known to history as the Corvina Library, and we shall at once be convinced of the highly artistic taste which was developed in those days. The wonderful ornamentation and the marvellous miniature paintings in those volumes, which were written on parchment, furnish the best proofs of the great love for art and perfection of workmanship which prevailed during the rule of this great king. No wonder that the Turks during their occupation of Buda attached such importance to the possession of this valuable collection, which consisted of 5,000 volumes.

The Hungarians will always be grateful to the present Sultan for having recently restored to the Hungarian nation a portion of this library, which had been scattered about his dominions and sacredly guarded there for centuries. The volumes were brought back to Hungary in a special train, and the occasion was marked by the greatest national rejoicing. The thanks of Hungary in this respect are due to that eminent Hungarian scholar, Professor Vambéry, who, with the consent of the Sultan, was entrusted with the task of searching throughout Turkey for these valuable volumes. I understand from my friend, Mr. Joseph Offord, the well-known Egyptologist, that one of the MSS. belonging to this library is in the actual possession of Lord Leicester at Holkham Hall, and it is sincerely to be hoped that this will be restored in the near future to the Hungarian nation, the natural custodian of such a priceless document.

In a country like Hungary, where patriotism is as sacred as religion, it is quite natural that the artists of the Middle Ages should have paid equal attention to the execution of

* From a paper by Louis Felberman, read before the Society of Arts.

subjects relating to national and historical life, and these are represented by the frescoes at the Gisella Chapel in Veszprém and the church of Turnicze, the latter of which shows an episode in the legend of St. Ladislaus. The fresco to be found at the cathedral of Szepesváralja displays an ecclesiastical subject with a political background.

Of the monuments and public buildings of the fifteenth century, the cathedral of Kassa and a few other village churches in Upper Hungary, as well as the beautiful town hall of Bártfa, in the same district, are the only relics of that period.

Amongst other architectural relics of the Middle Ages no doubt the most perfect specimen of the kind preserved is that of the castle of Vajda-Hunyad, formerly the city and stronghold of that immortal Hungarian hero Hunyadi-János (father of King Matthias). A replica in plaster of this building was exhibited at the Hungarian Millennial Exhibition and also at the Paris Exhibition, where it commanded the general admiration of all, and was considered as the finest specimen of architecture preserved from Mediæval times. The Hungarian Government have lately raised a beautiful palace for the Royal Agricultural Museum in the town park of Budapest, after the pattern of this castle.

Amongst the artists belonging to the Middle Ages hardly any names of importance have been handed down to us, but Hungary is proud to be able to claim the famous Albert Dürer as one of her sons, for although Dürer was born at Nuremberg he was of Hungarian parentage. His father, whose name was Ajtós, was born in the town of Cyula, in the county of Békes, and resided there until he migrated to Germany, where he took the name of Dürer, the German for the Hungarian name of Ajtós.

For over a century and a half, whilst the Turks were either knocking at the gates of Hungary or had practically become its masters, the Hungarians had no time to devote to art, for, to use the words of a famous poet, "They had to guard the country with their sword in one hand and to plough the land with the other."

With the final expulsion of the Turks (1699) the innate love of art made itself again potent, and two artists of great fame appeared on the scene in the persons of John Kupeczky (1676-1740) and Adam Mányoky (1673-1757), both of whom established a world-wide reputation, John Kupeczky having lived for many years in Rome and finally settled in Nuremberg, which at the time was the city of art and culture; whilst Adam Mányoky, who lived for many years and studied art in Hanover, Paris and Holland, became the favourite painter of the King of Poland, Frederic Augustus II., also Elector of Saxony. Both these artists cultivated the art of portrait-painting, and followed the style and tendency of the Rembrandt and Vandyke schools, of which they were most able exponents. It may be of interest to know that both of these painters are represented in the gallery of the Marquis of Bath and likewise in the leading collections of Europe.

The frescoes of the Budapest University Church date from the eighteenth century, and although they have been hardly dealt with by time, nevertheless they may be regarded as fine specimens of the Rococo style.

During the reign of the famous queen Maria Theresa (1740-80) art and science received great support and encouragement, and this was partly the case during the rule of her son, Joseph II. (1780-90), but unfortunately the kings that followed them have shown no desire, nor did they have any inclination, to encourage Hungarian art, science and literature; besides, their time had been otherwise taken up with continual wars, which was especially the case with Francis I. (1792-1835).

Under such conditions art again lay dormant, and the few who made it their profession could barely make a living, and some of the most celebrated portrait-painters had to take to painting signboards, or to adorn with pictures the household furniture of the peasants, while the sculptors had to work in the potteries. In the Koronaherzeg Street of Budapest there is a signboard which was painted by one of the most famous Hungarian artists, Barabás.

Towards the middle of the last century that great Hungarian patriot, Count Stephen Széchenyi, to whom Hungary owes so much for its resuscitation in many directions, had also seriously occupied himself with the promotion of the arts, and his activity in this direction was followed up with the greatest zeal and energy by the late Minister of Education, H. Auguste Trefort. With a view of attaining his object the late lamented Minister founded an art union, which had for its object the exhibition from time to time of pictures presented by Hungarian and foreign artists, which

were disposed of by means of a lottery amongst its members. The stormy period of 1848 and the sad days which followed put an end again for some time to the development of Hungary in general, and with it its arts and industries suffered; as soon, however, as peace was restored in the country, and by the treaty of 1866 Hungary had a free hand in the management of its affairs, the people settled down to work, and art and science commenced to prosper once more.

In the year 1870 the first school of fine arts was opened under the direction of the famous painter Gustavus Keleti, and later the school of painting began its activity under that illustrious painter Julius Benczur. The Government took the matter seriously in hand. A fine art society and other institutions were formed under their auspices, scholarships were granted to deserving art students, and in many cases the entire expense of their education was defrayed both at home and abroad by the Government. The result of this was that the country became possessed of some of the foremost artists in Europe, men whose names will be handed down to posterity.

Few nations indeed can boast of artists who rival Maurice Than and Charles Lotz. The gigantic ceiling painting of Lotz in the Budapest Opera House will for all time be the wonder and admiration of those who are privileged to set eyes upon this marvellous work of art, and the frescoes in the great vestibule of the central railway station at Budapest painted by Than are works of no less merit.

The historical painting by Julius Benczur representing the baptism of St. Stephen and the famous picture of Bartholomew Székely depicting the finding of the body of King Louis II. after the battle of Mohács, will be monuments of true artistic value for all time. To the same school as the former also belong the painters Alexander Wagner and Alexander Lietzenmayer.

Another Hungarian artist of universal fame was the late Michael Zichy, who, by wonderful and life-like subjects, familiarised the world with the great beauty and charm of the national ballads of that immortal Hungarian poet, John Arany.

And who does not know and honour the name of Michael Munkácsy who, by the aid of Professor Szamosi, and the landscape-painter, Ligeti, rose from the position of a carpenter's apprentice to the rank of the greatest of living artists? His large pictures of "Christ before Pilate," "Golgotha" and "Ecce Homo" have been exhibited and admired in London, whilst his numerous national pictures and other subjects have all attained universal fame. His pictures of Hungarian types and scenery which have brought to life some of the first poems written by Petöfi, the greatest of Hungarian poets, will live for ever in the history of Hungarian art. Munkácsy, prior to being a painter, worked as a carpenter in the town of Nagy Várad, where M. Szamosi, professor of painting at the college, discovered his talent and gave him his first lessons in art. It was my privilege to be a student of this professor many years afterwards, and this led to an intimate friendship between myself and the great painter in later years. I have seen many of his original drawings there, and a tailor of the town got one of his sketches for a pair of trousers, whilst my barber had his signboard painted by this future famous artist for 3s. 6d.

Árpád Festzi is another artist of great fame, and his picture "Mary and Magdalen at the Grave of Christ," and his frescoes in the Palace of Justice, as well as his colossal panorama representing "The Entry of the Hungarians under Árpád," are all triumphs; the last-named picture was exhibited some years ago in London.

Genre subjects are represented by numerous distinguished Hungarian painters. The religious pictures of Roskovics are as famed as the portraits of Vastagh, Horowicz, Balló, Parlaghy, Karlovsky, Bruck-Lajos, Fülep László, &c. The two last named are well known in this country, and those who may have the opportunity of visiting the exhibition of Fülep László's works in June next at the Fine Art Society in Bond Street will be convinced of the great merits of this Hungarian portrait-painter.

Unfortunately time will not permit me even to enumerate the host of distinguished artists in all branches that Hungary can boast of. I should, however, be doing an injustice to them were I not at least to mention their names in a casual way. They include Bihari, distinguished for gipsy and national life; Vágó, popular subjects; Margitay, humorous and modern social life; Lajos Ebner and Jankó, famed for their genre subjects; Markó, celebrated for his

landscapes; Telepy, mountain scenery; Ligeti Eisenhut and Tornai, for their Oriental subjects. A large collection of paintings by Tornai, representing life in India, China, &c., will shortly be seen at the Goupil Gallery, Regent Street.

In the plastic art and sculpture Hungary can claim to rank amongst the first countries in Europe; indeed, few nations can boast of so many famous sculptors as Hungary.

Stephen Ferenczy in the year 1840 was the first to pave the way. Then came Joseph Engel, whose mythological and genre style showed great merit. The monument of Széchenyi, by this artist, which was erected in the year 1880 in front of the Academy of Science, is a wonderful artistic work. Nicholas Izsó is rightly famed for national subjects, and his monument of the poet Michael Csokonai Vitéz, in Dereczen, is a masterpiece. The beautiful statues along the Danube quay at Budapest of Baron Eötvös and the statue of the great Hungarian poet, Petöfi, by the sculptor Huszar, are admired by all who visit the Hungarian capital.

Alois Strobl and George Zala are each deservedly famed, the first as the wonderful creator of that lovely monument representing the poet Arany, whilst Zala distinguished himself in the monument representing the Arad Martyrs and the recently unveiled statue of the late Count Julius Andrássy.

Fadrusi will rank for all time as one of the best sculptors, and his monuments of Maria Theresa and King Matthias will always be works of the highest merit.

Hungary boasts of a great number of highly-talented architects, and it is owing to them that the public buildings of the city of Budapest are considered among the finest in Europe.

Nicholas Ybl was the first to distinguish himself with his beautiful designs of the Royal Opera House, the Customs House, and the bazaar of the fortress of Buda. Nothing can excel in style and beauty the Houses of Parliament which were recently erected along the Danube quay, at a cost of nearly 3,000,000*l.*, after the designs of the architect, Emerich Steindl. The beautiful Gothic structure is a real triumph of art, and it is a worthy rival of the Palace of Westminster, which inspired the great artist.

The imposing new buildings of the Palace of Justice, close by, which were recently erected at enormous expense after the designs of Alois Hauszmann, likewise the new Palace of Buda, commenced by Ybl, and completed by Hauszmann, may be regarded as the pride of Hungarian architecture.

Altogether Budapest may be termed a city of art. There are two beautiful palaces of fine arts and a national picture gallery filled with the most precious treasures that money could purchase at home and abroad.

In addition to this there are numerous private collections both in Budapest and in the country. There is a museum of fine arts which will bear comparison with any of its kind, and everything is done by the King and the Government to encourage native artists and to induce them to live at home for the good of the country. It is fortunate that the country possesses such a gifted and esteemed nobleman as Count Albert Apponyi as its Minister of Arts and Culture. Doubtless under his able direction the arts of the country will flourish more than ever.

ORIENTATION OF BUILDINGS.

THE following interesting article appeared in the *Morning Post* on Tuesday:—

Although the subject is one which has occupied the attention of mankind since prehistoric times, the title of this article is no doubt somewhat of a mystery to the general reader. And yet all of us are, whether wittingly or not, greatly interested in the orientation of our own dwellings. It is the generally accepted belief that the ideal building for residential purposes is one which has its length placed due east and west, so that its front should face due south in the Northern and due north in the Southern Hemisphere. Whether in town or in the open country, people have a decided preference for houses so constructed. There is not a London house agent who does not include "a south aspect" as a special recommendation for many houses, whether the buildings are in a great fashionable square or in a more modest side street occupied by the working-classes. Of course, the real explanation of this universal desire to face south is that which was asserted in a very old play of the Red Indians of North America—

They worship the Sun for his great Light,
For that doth them great pleasure.

In this country, with its fickle climate and often gloomy skies, we smile at and pity the poor sun worshippers of the East, but in practice our own beliefs are not so very different from those of the Persians. We all recognise the beneficent influence of days of glorious sunshine, and to indulge in as much of it as possible we endeavour to make our houses brighter and more cheerful by so constructing them facing southward that they have shed upon them the greatest amount of sunshine during the day. Unfortunately, in towns the exigencies of space render it impossible to erect all houses with a south aspect, and many of us, therefore, have to be content with our best rooms facing the chilly east or the dull and dark north. The ancients were very particular in fixing the position of their dwellings, for there were no windows, and they had to consider how to secure a maximum of daylight indoors. It is beyond question that the marvellous temples and monuments of Egypt and other countries first inhabited by man were most carefully oriented. A temple would be erected in honour of some deity, which the ancients represented by a star or other heavenly body, and the building consequently was so planned that its main entrance faced the particular star on a certain festival day dedicated to the Deity—the patron saint's day, as it were. Even in this country we have in the arrangement of what is left of Stonehenge proof of an elaborate plan by the Old World architects on religious lines very similar to those adopted by Eastern people. As Mr. Penrose says:—"The object the ancients had in using the stars was to employ their rising and setting as a clock to give warning of the sunrise, so that on the special feast days the priests should have timely notice for preparing the sacrifice or ceremonial, whatever it may have been."

The Eastward Position.

This pagan idea of orienting temples was to a very great extent adopted by Christians in various countries. Practically all the older churches in the British Isles were built with their length from west to east, the chancel being at the eastern end, and the idea was carried even further, for many graveyards show that the dead were invariably buried in line with the church, with their feet towards the east. This burial practice goes back many hundreds of years, for it was observable in the discovery of human remains on Dover Hill, near Folkestone, last winter, the bodies having fifteen centuries ago been buried carefully with their feet pointing to the east. With the primitive Christians we may be certain that the method of orienting their churches was by direct observation of the sun, the root idea being, of course, that the sun rises in the east and sets in the west, so that by taking a bearing at sunrise or at sunset the building was supposed to be on an east and west line. As a matter of fact, however, it is only at the spring and autumn equinoxes that the sun rises and sets true east and west, as he then crosses the line, coming north for our summer and again crossing it going south for the southern summer, and as the year progresses the points of sunrise and sunset at the summer solstice are respectively east-north-east and west-north-west, and at the winter solstice east-south-east and west-south-west. Unless, therefore, architects and builders were possessed of a little astronomical knowledge there was a possibility of the line they adopted being appreciably in error. And this appears to have been the case, for churches dedicated to saints whose festivals are at about Midsummer and Christmas differed considerably in their orientation. Old churches whose patron saints were David, Gregory or Benedict—near the spring equinox—and Matthew and Michael and All Angels—near the autumn equinox—were placed practically true, but those whose patron saints were John the Baptist, Peter, &c.—at the summer solstice—and Holy Innocents, Thomas and John the Evangelist—at the winter solstice—were apt to be a couple of points, one side or the other, from the truth, as the sun's rising or setting was supposed to be observed on the patron saint's day, and, as we have seen, the sun's position varies according to the time of year. If this fact was not taken into account it was obviously impossible to insure that all churches should be built true east and west. To the devoutly religious members of the community it is, on many occasions, a matter of supreme importance that in their devotions they should be facing true east—not north-east or south-east—and it is for ecclesiastical lawyers to argue the question and decide what latitude should be permitted in these matters. The "eastward position" in the church service is admittedly a burning question, the occasion of much acrimonious discussion from time to time; but so little do the parties concerned trouble themselves about the actual facts that it is

quite possible, in some cases at least, that the celebrant whose actions are called in question actually faces west instead of east.

The Bearing of the Sun.

However, other times require other methods. From the long ago past, when our forefathers had to get up at about three o'clock in the morning to ascertain what they considered to be the eastern point of the horizon, we have advanced to the discovery of the compass, or, as it is generally known, the mariner's compass, which most of us imagine renders us quite independent of the sun, whose position, at any rate in this country, is only too often a matter of conjecture rather than certainty. But while the bearing of the sun changes day by day all the year round, and is therefore unreliable unless we make the necessary allowances according to the season, the compass on which we rely is also subject to more or less considerable errors—errors which architects generally ought to be perfectly familiar with, but which we should not, in the ordinary course of things, expect builders to have studied, although it is often very important that their handiwork should stand certain tests. It may be objected by architects that London is not a place in which to study the orientation of buildings erected by the aid of the compass, and that it is a perfectly reasonable objection in so far as the actual buildings go, for the line of frontage is not determined by the compass but by totally different considerations which we can all understand. Most of the modern London churches are built square with the street in which they stand, when the streets run nearly north and south, but in Queen's Gate, South Kensington, there is a church which presents a lopsided appearance, as it is at an angle with the pavement instead of being square with it. To be correct, however, the angle with the pavement should have been reversed. As it is the church stands east-north-east to west-south-west. Only a little further westward we find the church of St. Mary Boltons violating the popular belief in the east and west line. The mistake could not have arisen through observing sunrise or sunset on the patron saint's day, which is near the autumnal equinox, nor by an observation of the compass, for the church stands due north-east and south-west, and the east point of the orient on the spire has been set at north-east, so that when the wind brings the vane into north-west, for instance, the true wind is west. In Westbourne Park we find the church of St. Stephen turned completely to the rightabout, the entrance door being at the east end and the chancel at the west end. The services here are supposed to be of the Low Church type, and it would therefore shock the ideas of the worshippers if the vicar should be charged with practising the "eastward position." Yet it must be obvious from the construction of the building that if he faces his congregation when performing the offices of the Church he is always adopting the eastward position—when ever he turns to the altar he faces due west.

The Compass.

But it is not in church architecture only that the compass has led architects and builders astray. The compass has not only an error which is known as variation, due to magnetic attraction—which in our country draws it about a couple of points away from the truth—but it is also affected by the presence of iron and other objects in its immediate vicinity, which may correct the variation or largely increase it. To shipmasters these differences are well known and are allowed for, every ship being "swung for deviation" before going on an ocean voyage, the very nature of the cargo having to be taken into account. On shore anything seems to be good enough, and the variation and the deviation (two totally different things) of the compass are too often ignored. At the Army and Navy Stores, in Victoria Street, Westminster, we can purchase the best compasses on the market, and every information is afforded as to the errors of the instruments, yet on the roof immediately above an orient is fixed square with the building itself instead of due north and south. The architect's plan of a public institution in Berkshire shows by the orient that the building faces south-west, but in reality it faces due south, and a dial fixed above the southern entrance shows the correct time by the sun, which is sufficient proof that the architect had erred. But one of the most singular architectural mistakes in this respect is found in a well-known establishment in Ireland, where the architect's plan of each floor is exhibited for the information of visitors. The building really has its entrance facing north, the Polar

star being right opposite the door, while the dining-room faces the midday sun. Yet the architect's orients on the plans represent the entrance door to be facing south-west and the dining-room north-east. On pointing out this singular anomaly to one of the Irish attendants the reply was characteristic. "Och, sorr! it's all done with the Irish compass, which is different from all other compasses. Have you not seen the picture postcards in the shop windows showing how Pat is smashing up the London clock because he cannot admit there is any other time than Dublin time? Well, sorr! it's the same with the compass, and if our architect says we face north towards the sun you may be shure he is right—by the Irish compass."

GENERAL.

An Exhibition of primitive Umbrian art was opened on Sunday in the Palazzo dei Priori, Perugia, and will continue till November. The exhibition will comprise paintings, sculptures, miniatures, old brocades, church ornaments, woodwork, lace and embroidery—in short, every form of art which was practised in the fourteenth and fifteenth centuries.

The Plans for the new Technical Institute, Dundee, by Mr. Langlands, have been approved. The building will cost 40,000*l*.

Mr. George Hodson, a well-known civil engineer, water-works and sewage works specialist and mining engineer, and head of the firm of George & F. W. Hodson, of Loughborough and Westminster, died at Loughborough last week from acute pneumonia. The deceased gentleman was a native of Staffordshire, and was educated at Wolverhampton. He was a member of the Institution of Civil Engineers and the Association of Municipal and Counties Engineers, a fellow of the Sanitary Institute, the Geological Society and the Association of Water Engineers. He designed water and sewage works for more than sixty towns and districts in the country, and was consulting engineer to the Duke of Portland, Lord Savile, the late Hon. Mark Rolle, the Midland Railway Company, and Leeds, Leicester, Nottingham, Stockport and other corporations.

The Surveyors' Institution have accepted an invitation from the Scottish committee of the Institution to hold the next country meeting at Glasgow on May 23 and 24. Visits have been organised to various works and places of interest in Glasgow, and the Clyde trustees have allowed the use of a steamer for viewing the harbour and shipping yards.

At a Meeting of the Rugby Board of Guardians on Monday the building committee reported that the total cost of erecting and furnishing the new infirmary was 5,377*l*. The work should have been completed within twenty weeks of its commencement under a penalty of 10*l*. for each week's delay, but whereas it should have been finished at the beginning of last July, the contractor did not complete it till the end of November, and the committee recommended that penalties be enforced to the extent of 50*l*., because all the delay was not the fault of the contractor. It was moved that 100*l*. be deducted, as the board had to pay a clerk of the works 2*l*. 10*s*. a week for twenty-three extra weeks, and they were put to other cost besides, owing to the delay. It was decided to deduct 100*l*.

The York Consistory Court have granted the following faculty to the executive committee appointed to carry out the restoration of Selby Abbey:—"To reinstate the fabric of the abbey church at Selby after the fire in October 1906, and to build a new gable to the north transept thereof, and if any coffins or human remains should be exposed in the course of the underpinning of the central tower or otherwise in the course of the execution of the works, the same are to be taken up and reinterred with all decency in the churchyard surrounding the church, as near their present situation as circumstances will permit, and under the direction of the vicar and churchwardens, and to remove any tombstones or monumental stones or slabs in the church or yard which may interfere with the progress of the works, and to refix or relay the same as near their present situation as possible, the greatest care and decency being used in so doing."

A Conversazione of the Royal Society of Antiquaries of Ireland will be held in the Dublin Museum of Science and Art on the 15th inst. The Lord Lieutenant of Ireland will attend.

The Architect.

THE WEEK.

It is proposed to enlarge Horsell Church in Surrey, and for that purpose the north wall would have to be moved. An appeal was made by the Society for the Protection of Ancient Buildings to have the enlargement accomplished by extending the church eastwards. Mr. THACKERAY TURNER in his letter says:—"As the church stands, the chancel and its aisle and the vestries are modern, the western tower and the south aisle have been so thoroughly 'restored' that most of what meets the eye is modern work, and only the north wall remains to show what manner of building the original church must have been. With the exception of one modern window and two which have been a little modernised, this wall is an unspoilt example of an old building. The buttresses are very fine and the two-light fourteenth-century window is a most perfect example of Mediæval work. The committee cannot but feel that to pull down this north wall for the purpose of enlargement would indeed be very wrong if there were any other way of effecting the enlargement." The building committee, after a consideration of the report, have stated that they are unable to adopt the Society's suggestion.

A CASE was decided last week at the Wystrad Police Court which shows that the Merchandise Marks Act is applicable to slates. The Oakeley Slate Quarries Co., Ltd., of Portmadoc, were the complainants, and the defendants were a builders' supply company. A traveller representing the latter called on a builder and stated that as he wished to complete a truck he would like an order for about 800 slates. Accordingly an order was given for 800 Oakeley's old blue medium slates, 24 by 14, at 12½ per thousand, plus 2½ per cent. When the invoice came it was seen that Portmadoc slates were entered on to it. Then when the error was pointed out a second invoice was sent corresponding with the order. But when the slates arrived it was found they were not Oakeley's. The defendants offered to pay a fine of 40s. and tender an apology, but MESSRS. OAKELEY demanded the payment of a fine of 25% to a local hospital and an apology to be inserted in a number of trade journals, to which the defendants would not assent. Counsel for the defendants argued that they were not criminally responsible for the unauthorised act of one of their servants. The Bench came to the conclusion that the traveller had authority to deal with the matter, and that the plea of innocence which had been set up could not avail. A fine of 5% with costs was imposed.

WE hear so much of late about the advantage of having an authority to regulate the character of buildings in cities and towns, it might easily be imagined that the subject is not difficult to settle. The obstacles which arise in such cases were exemplified last week in Liverpool. The Dock Board has lately erected offices having a frontage of 265 feet and a height to the summit of the dome of 215 feet. A new building was proposed to be erected by the Royal Liver Friendly Society, which would have a total height of 295 feet with a frontage of 188 feet. Mr. ROBERT GLADSTONE, chairman of the Dock Board, and who is known to possess good taste, wrote to the Lord Mayor on the subject. In the course of his letter, he said:—"Unless a very considerable reduction is made, and the river brought into line with the new Dock Board offices, the fine architectural effect of the latter will be completely spoiled. Without questioning the fitness of the proposed building for business purposes, and the good

appearance which it might present in some other place, it is, I venture to think, quite unsuited to the George's Dock site, and if erected will prevent the realisation of a beautiful combination of buildings on a site which offers peculiar facilities for adding a magnificent architectural feature to the attractions of Liverpool. I earnestly hope that the present opportunity for beautifying our city may not be lost, to the profound regret of all lovers of Liverpool and of art." After the letter was read it was proposed that the subject should be referred to a committee, and that a model should be made to enable the members to judge of the effect of the two buildings. It was also proposed that the committee should have authority to engage any expert assistance which might be considered desirable. If there was ever a case relating to amenity in which deliberation would be advantageous it was that of the two buildings. But the jealousy of rival authorities could not be overcome. Some members of the Council believed that it was impertinence on the part of the Dock Board to interfere with plans which had been approved. Others considered that if the new building was not carried out the rates would suffer to the extent of 7,000£ or 8,000£ a year. Eventually the proposal for further consideration was defeated by sixty-two votes to nineteen. Liverpool is not the only place where there are rival authorities, and it is difficult to see how they can be controlled or coerced in matters of building.

FOR some time a committee of the Sussex Archaeological Society have been endeavouring to obtain suitable premises for a museum and library at Lewes. An old house known as St. Swithun's House was selected, but there was some difficulty in discovering the conditions under which it would be sold. A second house called the Barbican House was next brought under the notice of the committee. Its position is more suitable, as it stands near the castle, but the accommodation is less ample, and the price is likely to be 500£ higher than St. Swithun's. Moreover, possession cannot be obtained prior to next year. Mr. C. E. CLAYTON, architect, argued that the financial difficulties were likely to be overcome, and the following resolution proposed by him was unanimously adopted:—"That it be an instruction to the Council, through its sites committee, or otherwise, to negotiate for the purchase of and to purchase on behalf of the Society the house and premises known as Barbican House, Lewes; also in confirmation of the resolution passed on March 23, 1894, that the Council be requested and empowered to raise the necessary funds by the sale of the Society's Consols, subscriptions, mortgage, issue of debentures, or by such other means as may appear to them to be expedient."

PEOPLE must have wondered when they saw the announcement about the reopening of Selby Abbey on October 19 in the present year. If that statement were true the restoration would have been accomplished with more than American expedition. All that is contemplated is the reopening of the nave alone, and there is little doubt of its realisation. The other parts are not neglected. The choir pillars are almost complete. The pitched outer roof of the choir will, it is hoped, be completed in about three months' time. The underpinning of the tower piers is slow work. The two western piers are to be underpinned this summer, but the two eastern piers will not be attempted till the summer of 1908. The restoration of the north transept and Latham chapel is still more remote, so that probably two years may elapse between the reopening of the nave and that of the complete church. Although the subscriptions were liberal, it is believed additional contributions will be needed if the work is to be continued with energy.

ARCHITECTURE AT THE ROYAL ACADEMY.

II.

AN architect is fortunate who is able to introduce INIGO JONES'S Water-Gate in the foreground of a view of a building. This unique opportunity falls to Mr. PAUL WATERHOUSE in his "Offices for the Royal National Pension Fund for Nurses, Buckingham Street, Strand," which is in the Italian style, and in the shadowing at least bears some resemblance to the older work. Mr. F. L. PEARSON has a view of "St. Helen's School, Abingdon," a large suitable block. Another panelled dining-room in the Georgian period is by Mr. TEMPLE MUIR. "All Saints Church and Vicarage, Tooting Graveney," is shown by Mr. TEMPLE MOORE on a drawing which has a right to be called brilliant, for the sun shines on the roofs. It is a picturesque Gothic group, and suggests an arrangement which is not always obtainable. "Nos. 20 and 22 Hill Road, N.W.," by Mr. S. J. TATCHELL, are two houses of the local type, approached by many steps. "Design for Church Extension, Manchester," is rather indefinite. What Mr. EDGAR WOOD shows are very large buttresses, which appear to belong to a round building. The drawing is too small for the subject. "Premises, Warwick Street, Regent Street," by Mr. J. N. R. VINING, is a satisfactory effort to utilise a narrow site. The convex storey and the upper balcony have a pleasing effect. A small sketch of a garden front is shown by Mr. J. N. JOHNSTON. MESSRS. TREADWELL & MARTIN, from their experience, should know the architectural possibilities of London streets. "No. 3 Woodstock Street, W.," is an effective example of business premises.

The new building for Balliol College, Oxford, by Mr. E. P. WARREN, does not denote much respect for the *genus loci*, for it might be a Bayswater mansion with the large vases which once were signs of respectability. Mr. BERESFORD PITE, on the contrary, when designing his "Assurance Office, Euston Square," has remembered the Classicism of HARDWICK and the INWOODS in the vicinity, for the building is severe throughout, the principal storey having Ionic columns. The two designs for the "Law Courts, Bloemfontein," and the "University College, Transvaal," by Mr. E. J. WELLMAN, of Johannesburg, are both equal to the average English projects for similar buildings. There is a large dome in the former, while the college, if it should fail, could readily be utilised for offices, whether for Government or for commercial tenants. European precedents have been set aside in the extent of the accommodation provided. The "Clark Memorial Screen, Egguckland Church," by Mr. T. R. KITSELL, is rather novel, for musical instruments are the elements of the ornament. "Public Baths, Library and Fire Station, Reddish, Stockport," are an odd combination. MESSRS. DIXON & POTTER have successfully treated them in a low group. Mr. D. JOSEPH'S "Fitzgeorge Avenue" is another of the drawings which are too small to render justice to the subject. From the end view we see the flats are more suggestive of decorative treatment than is customary. The "City Hall, Belfast," by Sir BRUMWELL THOMAS, shows the entrance front, with the dome, &c., a view which suggests the unity of the different parts. Mr. JOHN BELCHER'S "Franco-British Exhibition, 1908," is Renaissance, but liberty has been exercised to introduce details which, if not warranted by ancient examples, are adapted to a building which is intended to afford entertainment. On the walls are drawings of houses by MESSRS. E. A. ALLFREY, W. A. AICKMAN, R. G. HAMMOND, H. INIGO TRIGGS and W. R. DAVIDSON. Mr. B. H. COLLCUTT has a design for a museum and art gallery, a design for a church in Cumberland is by Mr. J. E. DIXON SPAIN, and Mr. J. W. RHODES sends a clock tower. Mr. A. E. RICHARDSON'S "Suggested Architectural Treatment for Waterloo Place, S.W.," is more persuasive than a long essay, and suggests that if other improvements were indicated in a similar way there would be some chance of having better streets.

The "Lancaster Town Hall," by Mr. E. W. MOUNFORD, can be described as an example of the old-fashioned Classic which in England was adopted for various sorts of buildings. The front is surmounted with a pediment duly filled with sculpture, and there are the regulating number of columns of approved dimensions. It is no doubt appropriate in a town which claims to have had a Roman origin. MESSRS. RODWAY & DENNIS, in "St. Alban's, Bristol," apparently have not omitted a tower and spire temporarily; the building can disappear with them. The style is Perpendicular, with side chapels as well as transepts, and the whole forms a very careful group. The choir and transepts of the parish church Eccleshall, by Mr. TEMPLE MOORE, are in a very severe type of Gothic, and it is to be hoped the iron bars outside the windows are not a necessity on account of local roughs. Irish country houses, although they may bear resounding names, are generally commonplace buildings. MESSRS. WARWICK & HALL propose to reconstruct Killyon Manor, and, while it remains suggestive of many other residences near it, the large windows and the balconies extending along the front are improvements. It seems well adapted for "a meet." Mr. F. L. PEARSON'S "New Buildings, Wardour Street" have been already shown in the Academy. This year a staircase and gallery, and one of the rooms which appears like a library and waiting room combined, further suggest the great change made in the street. "St. Andrew's and St. Patrick's Church at Elveden" has a detached tower and a noble porch; the design is treated with much vigour by Mr. CAROE. The "House in Kensington Palace Gardens," by Mr. E. J. MANNING, suggests a much earlier period than Queen ANNE'S. The hall is of greater height, and has a far taller window than is usual in London houses. Although some years have passed since the first competition for Liverpool Cathedral, the design by Mr. W. J. JEWITT was worth exhibiting. It is a fine composition in the Italian style in which colour is lavishly employed in the window and roof, and sculpture is introduced without any regard for the edicts of the ecclesiastical court. Mr. T. G. JACKSON has two views of a mission church at Aldershot. Economy prevails, and in consequence all is simple. In the interior timber uprights are used to support the roof. The windows are small, and apparently there is a sculptured reredos. In his new chapel at Hertford College, Oxford, the style adopted is Italian. Columns serve for mullions in the windows, and columns also divide the sedilia. But at a distance the effect recalls a Gothic church. In the enlargement of Aldershot Church the stern tower remains as it was. The nave is widened, a vestry and gallery are added, and for these Perpendicular is adopted by Mr. JACKSON.

The noble group of the "Royal Infirmary, Manchester," by MESSRS. E. T. HALL & J. BROOKE, has not been fairly treated by having so lofty a position, through which the careful drawing cannot be appreciated. The latest example of a great building which is a realisation of the most advanced theories, it is one of the works which has exceptional interest at the present time. The divisions have specified purposes, they are connected by arches, and although repetition was inevitable the infirmary has the character of an unified composition. The "Church of St. Hilda, Croft Park," by MESSRS. GREENAWAY & NEWBERRY, departs from the old custom of keeping the roof of the chancel on a lower level than that of the nave. The drawing suggests that the nave has been overbalanced by the large chancel. There are not many memorials of architects, and the mausoleum to the late Professor BANISTER FLETCHER at Hampstead Cemetery, designed by his sons, possesses much interest. There is a portrait bust, and the canopy is supported by Ionic columns and is surmounted by a vase. At the angles of the pedestal are seated figures. The surrounding trees enhance the effect. The "Front of Shop and Office, Catherine Street," by Mr. H. H. STATHAM, is an effort to overcome some of the objections to similar buildings.

lower part, which is in masonry, seems capable of supporting the superstructure in brickwork, which in upper portion is made to appear lighter by the introduction of courses of bricks of a lighter colour. Alterations at Crawley Grange, which include a very large room, appear in a drawing by Mr. H. TANNER, jun. We suppose Mr. A. DUNN's "Design for Mednal Church, Westminster," expresses what was proposed by him when the project for the building was mooted. It is a Gothic interior, which appears more of a dream than a possibility. The church seems to be seen through a haze of a kind which cannot be taken to incense, and which may come from above. Though it we see gorgeous, gilded shrines unlike any which are now to be found in European churches. The Gothic ambition to attain height is allowed to play itself, and the fan-vaulting of the roof is at least equal to that at Cambridge. The "Students' Union, University of Liverpool," by Mr. C. H. REILLY, is not without originality. There are three or four varieties of windows, the piers are large, and the front seems as if parts had been reserved for decoration after. It is satisfactory to find that Mr. T. H. WILSON's ability has been recognised in America. The "Lodge Entrance, Brookland Wood House, Baltimore," with the cottages, large gate and screen, will serve to suggest an English origin to all who see it. The "Churchill Homes, Somerset," by Messrs. SILCOCK & REAY, form a terrace of cottages with red roofs, and are likely to form a pleasing feature on the landscape. The interior of "St. Chad's Church, Burton-on-Trent," by Mr. BODLEY appears to have used sandstone for the columns, and the style is therefore severe, but of fine proportions. There is a very light screen at the entrance to the chancel. The "Interior of English Church, Florence," offers a problem in architectural details. To most people an English church is expected to recall an English style and English ritual. But in Mr. BODLEY's drawing we see a body of monks resembling those of Italy. We see Italian altars, an Italian screen and crucifix, paintings, &c., all of which are adapted to compel an ignorant Catholic to imagine himself in a Roman Catholic church. That mode of concession is not adapted to the straightforwardness of English character, although a similar experiment was made in the Italian quarter of London. The "Memorial Fountain," by Mr. J. H. MORTON, consists of a basin with a wall fountain, a few Tuscan columns, the whole being enhanced by colour used with much discretion. "Conkwell Grange, Wilts," is a large house by Mr. E. GUY DAWBER. The windows are well emphasised and the occasional stone quoins in the chimney-shafts impart variety to them. The "Business premises, Lincoln's Inn Fields," by Mr. EUSTACE C. WARE, is for several storeys as plain a building as an economical manufacturer could desire. But we might say figuratively that the top storey blossoms into Gothic and in that way the building becomes architectural. In "St. John's House, Queen Square," the same architect attempts to impart, without much expense, a stateliness to an ordinary front.

The "Suggestion for Street Bridges Across the Thames," by Messrs. COLLCUTT & HAMP, is not a revival of the ponderous structures which at one time spanned Old London Bridge. A house on the bridge should consist of a shop and a storey over. The weight of the piers would consequently not exceed what has been sustained at the present time by the railway bridges over the river, and there need be no apprehension of the failure of foundations. It is remarkable, however, that in only a very few cases in Europe are buildings tolerated on bridges. The approach to the Thames bridge would be through a fine piazza. The plans of the new War Office are shown in two drawings by Mr. CLYDE YOUNG. The small drawing of "Sanctuary Fittings and Screens" for the church at Latchford, by Messrs. DOUGLAS & SHULL, suggests how delicate tracery can be enhanced

by an inscription and armorial bearings in colour and gold. The chapel to Colston School, Bristol, by Messrs. PAUL & JAMES, is Italian in treatment, the material being mainly red brick. The two large drawings of a church and country house by Mr. M. H. Pocock are very striking. The buildings are boldly sketched with a pen in ink, and a wash of yellow is laid over the sheet. The "Bishop's Throne, St. Anne's Cathedral, Leeds," by Mr. J. H. EASTWOOD, is not detached, but is set up on a Gothic arch having figures of prelates in the spandrels. Mr. R. A. BRIGGS contributes a view of the interior of a church on Sunbury Common, in which a round-arched arrangement is adopted, the walls of nave as well as chancel being panelled. Mr. COLLCUTT in his "House at Totteridge" avoids a symmetrical arrangement of windows, thus recognising one of the Mediæval principles which time has endorsed although it is not always acted on. Glasgow architecture is well represented in the Academy by the drawing of the "Engineers, and Shipbuilders' Institute," by Mr. J. B. WILSON, of which we publish a reproduction. The boldness of the treatment is evident, and the sculpture serves to suggest the purpose of the building.

The "Great Hall, University College School, Hampstead," of which Mr. ARNOLD MITCHELL is the architect, is dignified, capacious, well-lighted and well-adapted for assemblies. The two drawings of a hall and chimney as examples of Spanish Renaissance, by Mr. P. T. HILDESLEY, are attractive examples of a style that lends itself beyond most others to magnificence. The two drawings of the University of Birmingham, by Sir ASTON WEBB & E. INGRESS BELL, show the general view, and the detailed treatment may be inferred from the principal entrance. The large drawing of the entrance to the Victoria and Albert Museum, by Sir ASTON WEBB, should be acquired as national property as evidence of the superior draughtsmanship of our time. Another fine drawing, although not geometrical, is Mr. C. E. MALLOW'S "House and Garden, Tirleigh Court, Cheshire." It is boldly drawn in pencil, and centre lines and extensions of other lines are allowed to remain. It has, therefore, the character of being fresh from the designer's hand. The architecture has all the appearance of Early English Renaissance, on which it is a pleasure to look. Messrs. GROOME & BETTINGTON, in the "Restoration of Kinnersley Castle, Herefordshire," have respected the historical associations. Practically the buildings on plan form three planes, a tower serving as a connection between the first and third. The picturesqueness is undeniable, and the owners should be proud of such a building.

The "Proposed Building, Oxford Street," by Messrs. R. F. ATKINSON & BURNHAM, should, if the County Council will allow the architects fair play, become an interesting study, as it will combine in its planning English and American skill. To a large extent it is suggestive of Messrs. WARING'S building, although there is an absence not only of circular lights but of curved lines. It will be an imposing structure. Mr. A. N. PRENTICE'S "House at Willersey" is on plan, and recalls one of those spacious English mansions where height was not deemed desirable. The "Section of the English Church, Mauritius," by Mr. ERNEST SHORT, suggests that iron is to be used in the construction. Messrs. HUBBARD & MOORE in their "Proposed City Building" have succeeded in giving some novelty to the two ends by stopping the continuance of the cornice and introducing an arrangement of columns and consoles. The effect will, of course, be more impressive in reality than it appears on paper. Mr. HALSEY RICARDO'S "Station at Howrah, Calcutta," stands near the river. Boldness of treatment is as necessary for a railway building in India as in England, and is here adopted; colour is employed and the different departments are skilfully suggested.

At the east end of the room the competition for the Palace of Peace is represented. At the west end it is the competition for the extension of the Birmingham

Council House. The drawings are well worth study, for the conditions were restricted. Messrs. MALLOWS & CROSS might be supposed to have become *hors de combat* by their extensive use of sculpture. The building was separated from YEOWILLE THOMASON'S Council House by a street which has to be kept open, but over which a connecting bridge between the two buildings was placed. Some of the competitors, such as Mr. HARE and Mr. A. G. LATHAM, used the arch as a support for offices, while others used it simply as a passage. The arrangement in the different designs corresponds to an unusual extent, *i.e.* the centre and the ends project. It might even be said that the competition narrowed itself to a question of domes. Messrs. ASHLEY & NEWMAN, whose design was accepted, placed the dome over the centre. Messrs. TREADWELL & MARTIN, who received one of the prizes, had three domes. Messrs. MANSELL & DIXON had one at each end. Mr. HARE avoided domes. Mr. LATHAM seems to have had several. "A Bridge at Lisbon," by Mr. E. G. PAGE, is to be constructed of granite and ferro-concrete; the piers have sculptured groups. There are several other meritorious designs, and there can be no question that a close examination of the contents of the Architectural Room this year will be advantageous to the student, for both design and draughtsmanship are beyond the average in merit.

PAINTINGS AT THE ROYAL ACADEMY.

ANYONE who has attempted to describe the pictures seen in an exhibition soon becomes aware how much easier it is to deal with some classes of them than with others. Representations of remarkable events and pictures which are puzzles lend themselves to descriptions, while fine landscapes or scenes from human life which are delicately treated possess qualities which require subtle analysis. There is a temptation in England which compels artists to produce paintings which will immediately strike a spectator, and which can afterwards be talked about without difficulty. They manage such things far better in France. The French painter does not mind taking up a simple or commonplace subject, trusting in the competency of those who look upon his work to appreciate his skill in imparting interest to what did not originally possess it. There are two French pictures in the Royal Academy which will exemplify what we have said. One is *Cinq heures chez Paquin*, by M. HENRI GERVEX, whose works are admired by Parisians. The representation of a dressmaker's show-room containing a crowd of ladies would with us be considered merely as an advertisement and unworthy of the powers of an able artist. But the composition and colouring of the numerous figures have so much style that the picture pleases, in spite of prejudice. Another picture is *The Admiralty, Port of Algiers*, by Mr. F. A. BRIDGMAN, an American painter who has lived so long in Paris that he is as much a representative of French art as any native. We see a building stained by time, or, as SHAKESPEARE says, "blasted with antiquity." A few people are about. A Moorish rider with a scarlet cloak, which strikes everyone with surprise, is seen waiting near a white horse with a bright green saddle and accoutrements. There is a charm about the work which will bear study. It can be interpreted in several ways if desired, and yet the painting is no more than the representation of what could be seen during every hour of the day. It is a triumph of style, but it would tax a conversationalist to explain how so much success was obtained.

It seems to us that among the nine hundred oil-paintings which constitute the exhibition, there is a larger number than usual of works which more or less correspond to the two French examples. In consequence, people who will not take the trouble to consider qualities of execution, but rush from picture to picture, are likely to regard the exhibition as unimpressive.

The comparatively few paintings which attract and seize attention, either by the novelty of subject or treatment, are in consequence likely to be overpraised with the possibility that subsequently they may be victims of reaction. Anyone who is patient and capable to understand what is estimable in painting can, we think, discover a sufficient number of works in the rooms which will afford gratification.

If we look on the walls for works which seem to be adapted for architectural decoration, it is impossible to escape from disappointment. The time has not yet arrived for the revival of mural painting. The President, wisely referred at the banquet on Saturday to the proceedings of the Committee of the House of Lords respecting the decoration of the Houses of Parliament, where, as he said, there is room enough for every variety of treatment whether architectural, sculptural or pictorial. It was pointed out how many advantages would result from the encouragement of decorative art, a historical painting, besides elevating exhibitions of the Academy, where portraiture and studies from nature form the staple of the exhibitions almost to the exclusion of imaginative works. It may be long before the Treasury will be willing to repeat the experiments of fifty years ago at Westminster, and meanwhile painters must comply with the requirements of the market. But wealthy people would do well to remember that in Greece a great work of art was considered to be public property, and by giving commissions for the decoration of town halls and other buildings, they would be rendering a service not only to art but to the nation.

If few of the paintings in the rooms are adapted for mural decoration, there is enough to suggest how easy it would be for some of the artists to comply with the requirements of that class of art. If Mr. FRANK CRAIG's *The Maid* were produced in France it would probably be considered as suited for reproduction in tapestry. The great charge of cavalry, in which the long array of red spears becomes as suggestive as the armour of the force which was impelled against the English bowmen, some of them mere boys, could be as easily rendered as many other battle scenes which the Gobelins have executed. Mr. DRAPER's *Pearls of Aphrodite* would quickly be seen in the Hôtel de Ville or one of the mairies of Paris if it had been a French work. White and brown were favourite colours with the late PUVIS DE CHAVANNES, and he would certainly approve of the adoption of such a scene as *The Landing of the Pilgrim Fathers*, by Mr. C. PADDAY, if his advice were asked concerning the decoration of an English municipal building. The height of snow, the number of preachers and women, the general bareness, are quite enough to explain the seriousness, not unmixed with Mark Tapleyism, which we see in the countenance of the secular leader, who is not altogether satisfied, if amused, at the prospect of a land of promise. If one of their lordships who are considering the question of decoration were to purchase Mr. PADDAY's work, it would not be difficult to find space for it and an impetus would be given to historical art. Mr. VON GLEHN's *Diana* is professedly designed as an architectural feature, and the numerous nude figures are adapted with skill to a semicircular panel. *The Golden Youth*, by Mr. T. GOTCH, is as near an approach to decorative work as is to be found in the exhibition. Here we have a simple processional dance of boys and girls, with spectators who are a little older. The long lines of the dresses of the maidens in the background, the upright trunks of the trees and the sympathy expressed by the figures all assist in one purpose, which is the production of a work that would be agreeable to look on at all times. It is to be regretted that so much skill is exercised on a single picture which may pass from one gallery to another *via* CHRISTIE'S rooms. It should have a permanent home. The license taken by Mr. SIMS in his *Island Festival* suggests that he has studied the laws of decoration, and since they possess little

marketable value has boldly defied them. We have the elements of a Greek festival, probably one deemed to be religious; but BACCHUS, and not the law-loving ATHENÉ, seems to be the ruler of the occasion. Mr. VAL HAVERS'S *The Joy of Youth* is to some extent decorative in arrangement. But would not a work executed in so tight a manner be lost to sight on a dull day in England? Sir W. B. RICHMOND'S *Demeter at Eleusis* has a curious affinity with it, and, of course, is open to the same objection regarding invisibility. We need not, however, continue to speculate about decoration when the public continue to be indifferent to that form of art.

In some late exhibitions there appeared to be indications that scriptural and ecclesiastical scenes were coming into favour. There is a general absence of them this year. The only example we remember was *First Easter Dawn* by Mr. J. DOYLE PENROSE, which is a graceful interpretation of the morning visit of holy women. But antiquity is not neglected. Sir L. ALMA-TADEMA has followed the example of other painters, and will exhibit his elaborate Roman scene in one of the Bond Street galleries. But Sir E. J. POYNTER recalls ancient Rome by his *Lesbia and her Sparrow*, with its background of Roman architecture and sculpture. Work of that kind, however, requires research, which means loss of time, and Greek legends or guesses at Greek life are therefore preferred. Mr. R. W. MACBETH'S *Diana and Actæon* is well grouped and brilliant in colour. But he gives us merely suggestions of figures. Mr. J. W. WATERHOUSE'S *Jason and Medea* shows his usual care, for the embroidery of serpents on the crimson robe of the Princess is suggestive. He has also another classic pair, *Phyllis and Demophoon*; but we suppose the majority of visitors will prefer his *Isabella*. The famous pot of basil is placed on a pedestal in a garden, and that seems a more likely position than in her chamber. Mr. G. P. ACOMB HOOD recalls the syrens who appear on the rocks without any remnants of victims. Mr. HAROLD SPEED, in his *Love leaving Psyche*, has adopted a most difficult subject; but by making the departure at night and suggesting the upward motion of the god, probability is given to the legend. *Tithonus and Aurora* is well rendered by Mr. SPENCER WATSON.

Later history has inspired more examples, but they are still few in number. In addition to Mr. CRAIG'S large work, there are two other paintings devoted to ROAN OF ARC. *The Funeral of Charles I.* has been depicted by Mr. ERNEST CROFTS in a manner which exactly adheres to the description given by WOOD. The falling snow serves as a contrast to the mourning of the Cavaliers, and the scene is rendered with a simple pathos that is suitable. Mr. GOW in his *Cromwell* represents the closing of the doors of the House of Commons when the General ordered the bauble to be removed. It is assumed that the door was approached by a flight of steps. CROMWELL stands on the top waiting until the door is locked. In that way his supremacy is suggested; one trooper carries the mace and a few others close the approach to the members. In representing them Mr. GOW has shown more characterisation than is usual with him, and the scene has more reality than the burial of the king. Mr. EDGAR BUNDY has often shown he is a humorist, but *The Day of Sedgemoor* proves he has also a command over pathos. A young soldier who is wounded is seen lying on the straw in the loft of a barn, where he is attended by two women who apparently are forgetful of the risks attached to such exercises of humanity. The Arthurian legends have again furnished subjects. The Devil singing as a troubadour in a convent before the nuns is unquestionably a success if regarded merely as a combination of figures in black and red robes, fruit, stained glass, symbols. It might have been suggested by a scene in a low London public-house on a Saturday night, where a performance on a banjo excites the emotions of half-

drunken women. But who can care to see the degradation of his fellow mortals? BACON tells the story of a cat who became a princess, and who upheld the dignity of the position until a mouse happened to run across the table, and we suppose there is something of an objectionable sort latent in most human beings. But there must be a peculiar sort of sympathy with what is unpleasant whenever a pseudo-realism is allowed to reveal what had better be concealed. Infinitely preferable is Mr. DENIS EDEN'S *Peire of Valeria*. He is described as a "jongleur," and was likely to be akin to the Pied Piper of famous Hamelin city. We see him in his strange and cross-barred robe, with a high hat covered with peacock feathers, lying stretched on the ground with a few leaves in one hand and a little field-mouse on the forefinger of the other, with which he is holding colloquy. Although he may be considered as only a mountebank, he suggests the true poet's love of living things, and the artist is to be thanked for revealing him.

Scenes from modern life have evidently most attraction for buyers, and consequently they are abundant. *Our Golden Argosies*, by Mr. BERNARD GRIBBLE, which is in the first room, is a cluster of great ships, enough to indicate that commerce has not altogether come to an end with us. It is preferable to most of the pirate scenes which the artist has painted. Mr. STOTT'S *Cottage Madonna*, a woman with a child seated near a window, might pass for a work by G. F. WATTS. *The Town Mouse and the Country Mouse*, by Mr. G. D. LESLIE, are two children represented with the artist's customary scheme of colours. Mr. H. H. LA THANGUE has a couple of Sussex scenes under a flickering light, which makes fruit appear richer and ground more fertile. Two Ligurian scenes are enough to suggest that both districts are much alike in colour and in favour with the sun.

It is almost unnecessary to say the portraits are numerous. Mr. COPE'S *His Majesty the King* is curious, for the face seems to have been produced by a different process to the robes, or, in other words, different classes of colours and brushes were used for the head. Great care has been taken with the details of the robes, but without any loss of breadth. Another example of Mr. COPE'S art is *Sir William Perkin, F.R.S.*, who is seen lecturing on a skein of thread dyed with one of the coal-tar colours and surrounded by bottles containing others as crude. The inventor appears to be unconscious of their defects. There is a very important portrait—*Mrs. Henry van der Bergh*, by Mr. S. J. SOLOMON—which has the great merit of expressing a figure in repose. Mr. SARGENT has no less than five, of which *Lady Sassoon* is considered to be the most successful. It looks as if it were produced at terrific speed, and is unquestionably most vivid. But it does not suggest the endurance which should belong to a family portrait, although it is not impossible that it may long outlast works which appear to be more elaborated and slowly executed. *The Mrs. A. Langman* suggests a very delicate and refined lady, and the *Countess of Essex*, which is a bust in an oval frame, might have been painted for hanging in a room where there were some eighteenth-century portraits by French artists; it would sustain comparison with the best of them. *Sir Donald Currie*, by Mr. OULESS, is admirably painted, but the blue in the official robe would diminish the effect of any work in which it was found. *The Harvey Family*, by Mr. J. H. F. BACON, forms a group which gains by the adoption of white as the principal colour for the dresses: it deserves to be considered as one of the successes of the year. Mr. JOHN COLLIER, who as usual presents his annual puzzle in the *Mariage de Convenance*, has a fine portrait of Lord Justice BUCKLEY, which is really suggestive of a great lawyer.

Many of the landscapes this year are delightful. Mr. DAVID MURRAY shows his versatility as well as his vigorous handling. We have an autumn scene and the cutting-down of trees in *Across the River*; one of the

most remarkable views of Windsor in *The Duet*; an immense building in *The Windmill*, and a scenic landscape called *Wisteria*. Another painstaking landscape is the *View from the Battlements of Windsor Castle*, by Mr. W. DONNE. There are not many places which would bear representation from a similar height. Mr. EAST has a capital view of *Durham Cathedral* with the trees beneath waving their autumn foliage, while in the foreground there is a procession of monks. His *Storm in the Midlands* has novelty, and there is much solemnity about the *Nuns' Garden*. It is difficult to say whether Mr. G. WETHERBEE is a painter of figures with landscape or landscape with figures. He is sparing in the number he introduces, but they are never puppets as in most landscapes. *For Ever wilt Thou Love, and She be Fair!* is an Italian scene of great beauty in which the sun falls on the shepherd and his lass. Mr. FRIEDENSON'S *Runswick Bay* in the Front Room might be described as a landscape in olive green, for that is the prevailing colour, owing partly to a peculiar haze on the northern bay with its great cliffs and houses. Mr. NORTH has, as usual, only one example, which is described by a couple of lines from MILTON. It presents the usual tangle of vegetation in a green of which we never grow tired. But the appearance of a couple of children in the upper part without visible means of standing appears strange although affording a little variety of colour. Mr. HEMY will please Londoners by his view of one of the lower reaches of the Thames entitled *Bound for London*, in which the river, gulls, boats, and the border of old-fashioned public-houses, are satisfactorily combined. *Caught Out* shows a fisher-boat with three men preparing to meet a sudden gale. The *Deep Sea Rain* is somewhat daring, for a purplish tone is imparted to the waves which is sometimes seen in deep water but which few care to record. In the *Off-Shore Wind* the sea assumes an almost brilliant blue.

The room with cabinet paintings was never more interesting. There we can see an attempt by Mr. OULESS in landscapework, depicting a hill nearly bare of vegetation, with a lonely tramp ascending it. Mr. LEADER, as becomes the son of an engineer, is systematically constructive in his landscapes; but in *A Circus by the Sea* he has been fascinated by a circus, a windmill and a couple of lighthouses which were found together on a rough common. It is interesting in itself, but more so coming from such a hand. St. George's Hall, Liverpool, is made to lend itself to tragedy by Mr. DAWBARN, for it becomes *The Dooms-gate*, and we see it on a very gloomy day with a crowd outside, awaiting, no doubt, the result of a trial for murder. Mr. MACBETH has a brilliant *Market in Normandy*, and Mr. ALBERT GOODWIN shows Benares under a green light. There are over two hundred drawings in the Water-Colour Room and two hundred miniatures, besides the varied contents of the Black and White Room. People should be satisfied with so varied a show, in the production of which so many artists have co-operated.

THE ARCHITECTURAL ASSOCIATION.

THE annual members' dinner of the Association was held on Friday evening last at the Gaiety Restaurant, Strand, Mr. Walter Cave, vice-president, in the chair.

Among those present were Sir Aston Webb, R.A.; Mr. E. A. Abbey, R.A.; Mr. G. Frampton, R.A.; Mr. Alfred East, A.R.A.; Mr. H. Greville Montgomery, M.P.; Mr. Leonard Stokes, Mr. W. H. Jamieson, Mr. W. J. Locke, Mr. A. H. Hodge, Mr. Edwin T. Hall, Mr. H. Stannus, Mr. Francis Hooper, Mr. J. D. Crace, Mr. W. A. Pite, Mr. John Murray, Messrs. Louis Ambler, H. P. G. Maule, Stanley Hamp, Raffles Davison, A. H. Ryan-Tenison, Curtis Green, Theodore Fyfe, George Hubbard, A. W. Moore, J. A. Bessant, A. Huntley, Sidney Leaning, F. Frank Green, J. Peascod, Sutton Wood, Geoffrey Lucas, C. Butt, F. H. Atkinson, C. W. Bowles, H. B. Elkington, C. W. Beaumont, A. Welford, W. Stewart, F. C. Simpson, E. G. Simpson, W. G. B. Lewis, G. H.

Jenkins, G. H. Lovegrove, J. H. Squire, Alan Potter, R. F. Chisholm, T. O. Foster, H. L. Samson, S. J. Tatchell, A. L. Snow, L. M. Gotch, H. A. Douglass, H. G. Tayler, H. Saffery, Chas. Tanner, W. H. Burt, C. E. Hutchinson, Baxter Greig, J. Naylor, S. H. Goodwin, S. Warwick, Arthur Keen, W. T. Plume, E. Harvey Piper, E. Harding Payne, F. R. Betenson, W. R. Davidson, Stanley Towse, R. Dircks, Herbert A. Hall, H. Sandberg, H. J. Worrow, P. J. Westwood, Chas. E. Varndell, Guy Church, T. L. Dale, J. S. Cable, H. J. Wyeth, S. R. C. C. Buss, W. Paul, W. Wonnacott, H. C. Pride, Donald A. Stephens, H. C. Willis, Chas. Buck, F. Yerbury, E. B. Claypole, W. A. Hodges, B. F. Matthews, W. O. Langlein, A. H. Belcher, T. C. Yates, G. Northover, A. F. Spencer, Gordon Hake, Philip E. Webb, E. Gunn, Maurice E. Webb, M. W. Zambra, C. Wontner Smith, Philip Cart, G. C. Wilson, C. Whitby, A. Womersley, Clough Williams Ellis, J. B. Scott, C. R. Davy, Percy W. Lovell, S. Clapham, F. Dare Clapham, Hy. Tanner, jun., and D. G. Driver, secretary.

The following letter from the President was read:—

My dear Cave,—It is with many feelings of deep regret that I find myself unable to be present to-night.

I returned last Monday from the south-west of England intent on making my reappearance, after my long and dangerous illness. But, alas! my doctors emphatically and absolutely forbid me from undertaking the strain of presiding at the dinner, nor will they sanction my public appearance among my many friends who will be assembled at the festive gathering to-night.

This harsh verdict is, I need not say, a keen disappointment to me. I am deprived thereby of the opportunity of expressing my very sincere regret that I have been unable, almost from the commencement of the session, to undertake the duties which devolve upon the President for the time being, and that the culminating honour which practically brings my active career in the executive body to a close should have coincided so unfortunately with many months of suffering, and found me incapacitated from the pleasant enjoyment of activities and laudable aspirations to which I had looked forward.

To-night I hoped to have found a suitable opportunity of expressing my thanks for all the innumerable kind and sympathetic messages and letters which I have received, and, further, for the acknowledgment (with profound gratitude) of my indebtedness to the two vice-presidents, who fulfilled so zealously and admirably the duties which should have fallen to my lot.

I feel that the circumstances of the case may render pardonable the personal nature of this letter, but you must allow me, as President of the Architectural Association, to offer you, as my successor-elect to the chair, the truest and most hearty welcome, and the good wishes of all the members, for your term of office.—Very sincerely yours,

(Signed) R. S. BALFOUR.

Walter Cave, Esq.

After the toast of "The King," Mr. ARTHUR KEEN proposed "The Royal Institute of British Architects," and referred to the close and intimate relations which existed between the Institute and the Association. Owing to the important educational work undertaken by the Association, Mr. Keen thought it became increasingly necessary that they should have the recognition and help of the Institute. They were all grateful for the support that had been ungrudgingly given in the past by members of the Institute. In addition the Council made an annual substantial grant to the funds of the Association. They were not, however, concerned with Institute politics, nor even with the recognition by the State of its authority. If the project was successful they would be pleased, but their concern was with the advancement of the art of architecture, and it was in such matters that they looked to the Institute for help.

Mr. LEONARD STOKES responded to the toast, though he felt, he said, quite out of place in doing so. The duty of replying for the Institute, he felt, should devolve upon an old fogey. He always tried to feel he was an active member of the Association, and yet he was called upon to play the heavy father for the Institute. The relations between the two bodies were most cordial, but while the Institute was ever ready to help the Association he believed that perhaps after all the latter did more for the Institute. The Association was their recruiting ground for members, and if the recruits were good the Institute would continue to be a useful body to the profession. Their future, therefore, was largely in the hands of the members of the Association.

Mr. W. J. LOCKE proposed the toast of "The Association." He regretted the absence of the president, Mr.

halfour, and hoped that at no distant date he would be able to again exercise an active part in his profession. The Association was a league of youth, and should be distinguished by its vitality and enthusiasm. The Institute should exemplify the grand manner, and be concerned with greater issues. There should be a difference between the two bodies in order that each might fulfil its proper functions. The great mission of the Association was to uplift the architecture of the future.

The CHAIRMAN in reply said it was a matter for congratulation that the membership of the Association increased year by year and that 100 new members were elected within the last twelve months, making a total of 1,764. The figures were a sure sign of the vitality of the Association. During the past year an athletic club had been started and the results in the various sections were highly satisfactory.

Mr. H. TANNER, jun., proposed "The Guests" in a humorous speech, to which Mr. E. A. ABBEY, R.A., responded. Mr. RAFFLES DAVISON submitted the toast of Mr. D. G. Driver, the Secretary, which was very heartily received.

The Architectural Association Choral Society and Quartet contributed to a programme of music, arranged between the casts.

CREATION OF "ANTIQUES."

IN a report to the Washington Bureau of Manufactures, Mr. M'Nally, the United States Consul at Liège, describes some of the methods adopted by dealers in "antiques." He says that, in anticipation of a good season, the European manufacturers of "antiques" have been kept busy. The "ageing" season is now on, and when the time comes for placing the articles on sale the ancient appearance will be perfect. The deception of the expert collector is by no means rare, and yet one hears of Americans returning with antiques which cost considerable sums bought solely upon the lavish representations of the dealer. It should be remembered that the dealers pick up their stock in out-of-the-way places, usually in the interior of the country, and this should be a hint to other purchasers who in looking for particular articles should stop in places outside the well-beaten path. The chances of getting the veritable article are good, while the price will ordinarily be 100 per cent. less. To purchase from the dealers in the large cities is to pay excessive prices for questionable goods.

The Mecca of the curio-seeker is Bruges, which is noted for its valuable finds. The buyer does not stop to consider that the dealers for years past have swept every corner of anything savouring of antiquity, but continues to pick up at cheap prices whatever is offered. The American traveller (always reputed a millionaire) is considered the prey of these designing dealers. A visit to the workshop of antique dealers will show them pounding modern brass to represent the old-time article, and worm-eaten and decayed furniture is made over into pieces representing the old Flemish type that would deceive the ordinary collector. The dealers carrying the greatest assortment of valuable articles and well housed on a principal street should be as carefully investigated before buying as the small dealer in the back street. Even these small one-room dealers are supplied by the larger ones with articles that will catch the eye. It is from just such shops that the reports come of some "valuable original articles purchased for a song," small cigar shops, cafés and other unpretentious business places are usually provided with an old painting (made to order), a copy of some well-known work, which will at once excite the curiosity of the customer, who is particularly influenced by the surroundings. A good price is paid, and the buyer writes his friends that he picked up a "great find."

DECAY OF STONE IN GLASGOW.

AT last week's meeting of the Royal Philosophical Society of Glasgow, Mr. David Ellis, Ph.D., D.Sc., Lecturer in Botany and Bacteriology at the Glasgow Technical College, read a paper on "The Iron-Bacteria and their Connection with Stone Decay." He said every substance not specifically sterilised contained bacteria on its surface, and stone was no exception. Hence no argument based on the presence of bacteria had any weight unless a casual relationship could be established. So far this had not been done. From his own researches he was able to emphatically deny that iron-bacteria were present in any stone surface. He did not think that any change in the iron

constituent of the stone was effected by bacteria, in view of the ease with which this oxidation could be effected by the atmosphere. Nor did he think that any change was effected by bacteria, because under exceptional circumstances decay was observed by him in places where no bacteria of any kind were present. If antiseptics were used as preventives of decay the good they did was due to chance. Personally, he believed that the mechanical processes taking place in stone were sufficient to explain the causes of decay. There were as factors, first, the disintegrating effect of water with carbon dioxide in solution dissolving out the calcium carbonate; second, the disintegrating effect of water in places like Glasgow with a small amount of sulphuric acid in solution, which must enter as a factor, as the decayed stone had been shown to contain more than the normal amount of sulphates. To this he would like to add, in the third place, oxidation of the ferrous carbonate by the atmosphere of the hydroxide. When once the thin end of the wedge had been driven in there were the changes of volume due to the changes of temperature and the disastrous effect of the increase of volume of water when it changed into ice. All these required that the stone be moist, and the segregation of moisture on certain spots explained why decay took place in certain parts only. To those who maintained that the action of micro-organisms played a rôle in this decay he could only say that the onus of proof lay with them.

THE BRITISH ASSOCIATION.

THE seventy-seventh annual meeting of the British Association will be held at Leicester from Wednesday, July 31, to Wednesday, August 7. The president-elect is Sir David Gill, formerly His Majesty's astronomer at the Cape, and the vice-presidents are Sir Edward Wood (mayor of Leicester), the Duke of Rutland (Lord Lieutenant of the county), Mr. R. Dalglish (High Sheriff), the Earl of Dysart, Earl Howe, the Bishop of Peterborough, the Bishop of Leicester, Sir Oliver Lodge, and Mr. Herbert Ellis, president of the Leicester Literary and Philosophical Society. The reception-room at Leicester will be opened on Monday, July 29, for the issue of tickets to members, associates and ladies, and for supplying lists and prices of lodgings to strangers on their arrival. The inaugural meeting will be held on Wednesday evening, when Sir David Gill will assume the presidency and deliver an address. On the following day the Mayor will hold a reception at a fête to be given by him in the Abbey Park. On Friday a discourse on "The Arc and Spark in Radio Telegraphy" will be delivered by Mr. W. Duddell. On the Monday a discourse on "Recent Developments in the Theory of Mimicry" will be delivered by Dr. F. A. Dixey; on the Tuesday there will be a *soirée* in the Museum buildings, and the concluding meeting will be held on the Wednesday at half-past two o'clock. Excursions will be made on Saturday, August 3, to places of interest in the district, such as Chatsworth, Haddon Hall, Belvoir Castle, Warwick, Kenilworth, Stamford and Peterborough. A special excursion will be made to the Charnwood Forest.

The following are the presidents of the various sections:—Mathematical and physical science, Professor A. E. H. Love; chemistry, Professor A. Smithells; geology, Professor J. W. Gregory; zoology, Dr. William E. Hoyle; geography, Mr. George G. Chisholm; economic science and statistics, Professor W. J. Ashley; engineering, Professor Silvanus P. Thompson; anthropology, Mr. D. G. Hogarth; physiology, Dr. A. D. Waller; botany, Professor J. B. Farmer; and educational science, Sir Philip Magnus, M.P.

Architects who are Liverymen intend to support Mr. C. Cheers Wakefield, C.C., in his candidature for the office of Sheriff for 1907-8. He has various claims on them, and they have also the confidence that he will uphold the position with dignity, attention and impartiality.

The Fine Art Society, of 148 New Bond Street, have acquired the copyright of Mr. F. Cadogan Cowper's picture at the Royal Academy, "How the Devil, disguised as a vagrant troubadour, having been entertained by some charitable nuns, sang to them a song of love," and will publish an important engraving of it in the course of the autumn.

NOTES AND COMMENTS.

WHEN the International Sanitary Convention was held in Paris in 1903, a resolution was passed in favour of the creation of an International Health Office in Paris. It was to be established on the lines followed in the institution and conduct of the International Office of Weights and Measures. The International Office was to collect information as to the progress of infectious diseases. To this end information was to be given to it by the chief health authorities of the States that are parties to the resolution. The office was periodically to set out the results of these labours in official reports which were to be communicated to the contracting Governments, and which were to be made public. The office was to be supported by contributions from the contracting Governments. Time has been allowed to make all the arrangements, but apparently the French Ministers have been too engrossed in other affairs to take any trouble about international sanitation. Such an office is a necessity, and if France declines the privilege it should be offered to another country.

It consoles the thrifty spirit of Frenchmen and atones for much official extravagance when they learn that the new Cour des Comptes consists of masonry which was prepared nearly a century ago. The large building, of which M. MOYAUX is the architect, is erected with stones which were intended for the palace of the King of Rome, the son of NAPOLEON I. As the child was born in 1811 and the Empire came to an end in 1815, it seemed to be somewhat precipitate to make provision for a palace which he was not likely to use for several years. But NAPOLEON was desirous to convince Frenchmen of the duration of his dynasty. Accordingly a site was selected where the Trocadéro now stands, and PERCIER and FONTAINE were commissioned to prepare plans of the palace, which still exist. A start was made in cutting stone, but the downfall of the Emperor prevented the realisation of the project.

In New South Wales an Act for the official examination of scaffolding and lifts has been in operation since 1902. It is reported that there is a marked improvement in the class of scaffolding used in the proclaimed districts, and that contractors generally are anxious to comply with the provisions of the Act, and also with the requirements and directions of the inspectors. Amendments have been submitted with a view to giving more effect to the spirit of the Act, especially with regard to steam cranes, hoists for building purposes, lift enclosures and lift attendants. About 6,700 inspections have been made during the past year. The Scaffolding and Lifts Act provides that notices must be given for scaffolds over 8 feet in height; but power is vested in the inspector to give directions where considered necessary to persons erecting or using scaffolding or gear under that height. This power is fully taken advantage of. There have been recorded six fatal accidents and eighteen casualties upon buildings in course of erection or repair, but in no instance was any accident attributed to defective scaffolding or gear. No appeals have been made with respect to scaffolding. This is, no doubt, due to the amended regulations, which allow contractors certain alternatives in the erection of particular classes of such structures. Twelve steam gantry cranes and twenty-three steam hoists have been used in the metropolitan area and in connection with building operations. These have been inspected with varying results. An innovation in machinery for building purposes is the use of hydraulic lifts, two of which being at present in use. The number of lifts recorded as in commission is 765. The amended lift regulations provide that "goods" lifts must have almost the same precautions for the safety of those working them or using them as passenger lifts. These requirements have necessitated the outlay of large sums upon structural alterations to enclosures; but the users of the lifts are more than satisfied by the additional safety.

ILLUSTRATIONS.

CRATHORNE HALL, YORKSHIRE.—GARDEN FRONT, GENERAL VIEW.

WELLINGTON HOUSE RESIDENTIAL HOTEL, BUCKINGHAM GATE, S.W.—MAIN ENTRANCE.

THIS building, of which two illustrations—a perspective view and detail drawing of a portion of the front—appear in the present issue, will, when completed, be one of the most important of the series of magnificent residential hotel buildings recently erected in the West End of London. The building will be called the "Wellington House," and is erected upon the site of what was known as "Petty France," in the centre of historic associations connected with the period of the Peninsular War. The block, which has frontages to York Street and Buckingham Gate, will comprise about thirty-seven luxurious suites of rooms and chambers, to which will be attached upon the ground floor and basement handsomely appointed and fully-equipped reception, dining, drawing and billiard-rooms (with well-appointed kitchens, &c., in connection), the use of which will be placed at the disposal of tenants generally. A portion of the frontage to James Street, Buckingham Gate, will be occupied by several handsome and valuable shop premises. The elevations are carried out in red brick and terra-cotta, the latter by DENNIS, of Ruabon, and the internal appointments will be upon the most lavish scale. The amount of the contract is 64,704*l*. The architects are Messrs. PALGRAVE & Co., of 28 Victoria Street, Westminster; the contractor, Mr. C. GRAY, of Acton and Shepherd's Bush.

ENGINEERS AND SHIPBUILDERS' INSTITUTE, GLASGOW.

THIS illustration is a reproduction of a drawing in the Royal Academy. The building stands at the corner of Elmbank Street and Elmbank Crescent, nearly facing the High School of Glasgow. Architects practising in Glasgow were invited to prepare plans for the new buildings, and fifty-one responded to the invitation. After receiving the report of the assessor, Mr. G. WASHINGTON BROWNE, of Edinburgh, the plans of Mr. J. B. WILSON, A.R.I.B.A., Bath Street, Glasgow, were accepted as best fulfilling the requirements of the Institution. Internally the building will be arranged on three floors and basement, with lecture halls, ante-rooms, council and committee-rooms, library, reading and secretarial rooms, on a scale adequate to the demands. The accommodation provided also will partake somewhat of the character of a club where members may meet and confer in a social as well as a business and professional way. A large lecture hall, 72 feet by 40 feet, and with comfortable seating accommodation for between 450 and 500, will be provided on the upper floor; a lesser lecture hall, 40 feet by 22 feet, being also arranged on the first floor. On the street floor there will be a library 46 feet by 40 feet, and a reading-room adjoining, 40 feet by 25 feet, and on the same floor—convenient both to the street and to the inner parts of the building—council-rooms, secretary's office, &c. The basement will be devoted to stores for books and documents, with special access from the library and reading-rooms, and to accommodation for heating and lighting plant. Besides rooms for committee meetings, &c., the first floor will have a spacious and cheerful smoking-room, as well as a coffee-room in which members may confer and meditate in "lighter vein" than in the lecture halls and committee-rooms. Cloak-rooms and lavatory accommodation will be ample on all floors. The entrance hall and the corridors throughout will be spacious, while the wide double flight of stairs leading to all floors will be copiously lighted from a handsome dome roof. The external walls are built of cream-white sandstone from Blackpasture quarry. Marble and mosaic is proposed to be freely used in interior. Heating by low-pressure steam or "Reck" system. Ventilation by electric fans.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual general meeting of the Royal Institute of British Architects was held on Monday last, with Mr. H. T. Hare, vice-president, in the chair. The report adopted stated that the Council have held twenty meetings, of which the Council elected in June last have held fifteen. Reports were received from the following committees:—Charter revision, competitions, prizes and studentships, Finance, sessional papers, professional questions, fellowship drawings, fellowship election procedure, London County Council.

The losses by death have been as follows:—*Fellows*: George Murray Alexander, Thomas Barnes-Williams, Roger Thomas Conder, Colonel Joseph Gale, William John Gant, George W. Hamilton-Gordon, Richard Creese Harrison, John Nixon Horsfield, David Jenkins, William Alfred Large, George Low, William Mackison, Frank Barlow Osborn, Henry Allen Prothero, Edward Salomons, Henry William Lock, William Angelo Waddington, Philip Wilkinson, Edmund Woodthorpe. *Retired Fellows*: Henry Simpson Legge, Andrew Moseley. *Associates*: Lewis Eric George Collins, John Wardle Donald, Sydney Fowler, Frederick William Ledger, Charles Long, Arthur Maryon Watson. *Hon. Associates*: Lord Montagu of Beaulieu, Colonel Lenox Prendergast. *Hon. Corr. Members*: Albert Thomas, Johan Louis Essing.

The present subscribing membership, compared with that of the previous year, is as follows:—

Year.	Fellows.	Associates.	Hon. Associates.	Total.
1906 . . .	749	1,177	46	1,972
1907 . . .	862	1,254	46	2,162

Since the last annual general meeting 136 Fellows have been elected, 112 Associates and one Honorary Associate.

Progressive examinations were held in June and November 1906. The preliminary was held in London, Belfast, Birmingham, Bristol, Cardiff, Dublin, Glasgow, Leeds, Liverpool, Manchester and Newcastle-on-Tyne; the intermediate in London, Belfast, Bristol, Glasgow, Leeds, Manchester and Newcastle-on-Tyne. The Council desire to record their thanks for the valuable services rendered by the hon. secretaries and examination committees of the various allied societies. The final and special examinations were held in London, and special examinations for colonial candidates were held in Toronto and Melbourne, when four candidates were examined and two passed. The results are:—

	Number Admitted.	Ex-empted.	Ex-aminated.	Passed.	Rejected.
Preliminary examination . . .	450	124	326	221	105
Intermediate examination . . .	309	9	300	141	159
Final and special examinations . . .	202	—	202	111	91

The total number of candidates was 961. The number probationers now stands at 2,707 and of students at 879. The Council again have occasion to regret that so large a number of students remain on the list without proceeding to the final examination.

The statutory examinations, qualifying for candidature as district surveyor in London and for candidature as building surveyor under local authorities, were held in London in October, when eighteen candidates presented themselves. Certificates of competency to act as district surveyors in London have been granted to Horace William Lubitt [A.], William Robert Davidge [A.], Percie Ion Elton, Herbert Kenchington, Gilbert Henry Lovegrove, William Herbert Rogers, Herbert Shepherd [A.], William George Hipwright and Collings Beatson Young; and a certificate of competency to act as building surveyor under local authorities to Harry Prince Healy.

It having been considered that the silver medals awarded by the Institute for the essay and the measured drawings were out of date, the reverse still bearing the title "Institute of British Architects," the Council approached Mr. George Frampton, R.A., with a view to his making a new design. Mr. Frampton has generously responded by presenting the Institute with a charming design for the obverse, and has superintended the striking of the dies, the reverse now, according to his suggestion, bearing the Institute seal. The portrait of Sir Aston Webb, R.A., by Mr. Solomon J. Solomon, R.A., was duly presented to the Institute in the name of the subscribers by Sir William Emerson at the general meeting on December 17 last. Mr. Frank Dicksee, R.A., has kindly accepted the commission for the portrait of Mr. John Belcher, A.R.A. The Council, at the request of the Mayor of Venice, have lent the International Exhibition of Fine Art at Venice Mr. J. Sargent's portrait of the late Mr. Penrose for a period of six months.

The Council have had correspondence with the First Commissioner of Works with regard to the completion of the towers, shown in the late J. M. Brydon's design, in the new Government buildings facing Great George Street, with the result that the First Commissioner has acceded to the views of the Council, and given instructions that the single tower of the building now in course of construction shall be continued and completed on the lines laid down by Mr. Brydon. The First Commissioner, in the course of a reply to a question in the House, read the letter he had addressed to the Institute.

The instructions to competitors for the London County Hall having now been issued, the Council can do no more than note briefly the following facts:—The London County Council drew up the conditions on the lines indicated in the original suggestions of the Institute Council referred to in the last annual report, but several important modifications were made and the details embodied in the conditions which were finally issued were not submitted to the Institute Council. In these original suggestions the Institute Council did not contemplate the international character of the competition, but acting on the advice of the competitions committee, refrained from making any representations on the subject when the intention of the London County Council became known. The Institute Council were not consulted in any way as to the selection of the eight architects invited to take part in the final stage of the competition. At the suggestion of the Institute the London County Council has extended the whole time required for the preparation of drawings to nine months, of which six are to be devoted to the preliminary stage. The Institute Council have also addressed a communication to the London County Council protesting against the appointment of their official architect in the dual capacity of assessor in the competition and joint architect to the building.

It is to be regretted that the repeated submission to the London County Council of the views of the Institute Council referred to in the last annual report resulted in a final communication from the London County Council declining to reconsider their decision as to the line of frontage on the north side of the Strand between the churches of St. Mary-le-Strand and St. Clement Danes.

On April 22 a deputation from the Institute Council laid before the Building Act committee of the London County Council their views as to the status of district surveyors, urging a return to the practice of appointing practising architects of established reputation. The Council have taken counsel's opinion as to the operation of the Workmen's Compensation Act, 1906, as between (1) architects and clerks of works, (2) architects and assistants, (3) architects and pupils, (4) building owners and architects. Their opinion will be published in the Journal.

The Ulster Society of Architects, having severed its alliance with the Royal Institute of the Architects of Ireland, applied for alliance with the Institute. In view, however, of the protests raised by the Irish Institute, the Council deemed it advisable to defer consideration of the application until such time as the Irish Institute and the Ulster Society might come to an amicable understanding.

Since the issue of the last annual report the awards in the Palace of Peace at The Hague international competition have been made. Mr. T. E. Colcutt, the British member of the jury, read a confidential report to the Council criticising the awards. The Council had before them an invitation from a Dutch committee to co-operate in a movement of protest, but declined.

The seventh International Congress of Architects was successfully held during the week from July 16 to 21. It was attended by foreign members from every country in Europe and from America and Japan, and the Council have been much gratified by the courteous expressions of appreciation they have received from all quarters at home and abroad. The Congress was financially successful, and the executive committee have a balance of nearly 600*l.* in hand for the printing, &c., of the *Compte Rendu*, or volume of Transactions of the Congress. This will be issued shortly to members of the Congress.

The Council entrusted to a special committee the consideration of the resolutions with regard to the question of registration passed at the general meeting on April 3, 1906. The committee held many meetings during the Session and finally reported to the Council. The Council's report came before the General Body on the evening of March 3, when with an amendment the report was adopted and the Council were authorised to prepare a revised Charter and a Bill for

Parliament for submission to the General Body. The Council have entrusted the task to the same special committee, who are now in the midst of their labours.

The following resolutions were carried at the general meeting of January 7 :—

1. Resolved, that in view of the fact that limited competitions for public buildings erected with public moneys are a great injustice to the young and unknown members of the profession struggling for recognition, and also not in the best interests of the promoters, this Institute declares that such competitions should not be limited, and should take such steps as may be deemed advisable to discourage public bodies from instituting such competitions. 2. Resolved, that this Institute exert its influence in obtaining the abolition of the growing custom of penalising non-competing architects by retaining their deposit. 3. Resolved, that this meeting considers that the assessor in a competition should refrain from any expression of doubt as to the relative merits of the designs placed in his award, such expression of doubt being calculated to weaken the effect of his award and to lead the promoters to override it, to the great detriment of the object aimed at, viz. the adoption of the best design.

The Board of Architectural Education report as follows :—Since their last report the Board, in response to a request from the Victoria University, Manchester, have appointed visitors to report on the work of the students at the School of Architecture. The University of Liverpool, after conferring with representatives of the Board, have arranged to confer a degree in architecture, to be entitled "B.Arch." The Board also call attention to the fact that the University of London has instituted a B.A. degree in architecture. A syndicate for the consideration of a school in architecture and a diploma was appointed by the University of Cambridge, and invited the Council of the R.I.B.A. to nominate delegates. Sir Aston Webb, Messrs. Reginald Blomfield, Cross and Slater were nominated, and attended a meeting of the syndicate at Cambridge, where they expressed their views as to the proposals submitted. In view of the discrepancy that appears between the R.I.B.A. examination papers and the syllabus of the Board, the Board have requested the Council of the R.I.B.A. to appoint a joint committee of the Board of Architectural Education and the Board of Examiners to consider their relations and the nature of the examination papers.

During the past year the visitors appointed by the Board have attended periodically the Architectural Association day schools, the Architectural Association continuation schools, the Architectural Schools of Liverpool University, University College, London, King's College, London, and Victoria University, Manchester, and have reported to the Board making suggestions with regard to the work, which have been duly forwarded to the authorities. A sub-committee of the Board has been appointed with a view to obtaining diagrams of standard examples of doors, windows, domes, vaults, &c., for use in the various schools. A form of certificate has been approved by the Board, and is now granted to students. The Council have the pleasure to report the continued financial prosperity of the Institute, and to point to the balance of 1,435*l.* 16*s.* 9*d.* of income over expenditure, which is gratifying in view of the extraordinary expenditure of 631*l.* in connection with the International Congress. It is due in great measure to the increase in membership. The sum of 3,000*l.* has been invested this year, thus bringing up the invested capital of the Institute to 21,000*l.*

PREHISTORIC CISSBURY.

A PARTY of the members of the Brighton and Hove Archaeological Club visited Cissbury, under the guidance of the hon. secretary, Mr. H. S. Toms. Situated on the top of a high hill about four miles to the north of Worthing, Cissbury is, says the *Sussex Daily News*, the site of two of the most important evidences of the occupation of Sussex by very early man. The most striking of these is the formidable hill-fort, which consists of a deep ditch and high rampart, running round the top of the hill and forming an elliptical enclosure of nearly seventy acres. The strength of the earthwork can be realised when it is stated that the outline of the ditch and rampart is, on a clear day, plainly visible from the Dyke Road, ten miles away.

Outside the camp, near the southern entrance, and occupying the greater part of its western interior as well, are a large number of basin-shaped depressions from 20 to 70 feet in diameter. These, it was mentioned, were of even

more interest than the entrenchment itself, for about thirty years ago they were subjected to a thorough investigation by General Pitt-Rivers, Mr. Ernest Willett and others, who decided that they were filled-in shafts of pits dug into the hill.

The whole of the material with which they were filled was taken out, and when the bottoms were reached, sometimes 30 feet deep, tunnels were found branching out in every direction, and following up the veins or layers of black flint in the chalk. Sometimes these tunnels intersected those of the adjoining pits, and so literally honey-combed the hillside.

Lying on the bottom and among the material which filled the pits and tunnels quantities of broken and perfect flint axes were discovered, together with other implements of thousands of artificial flint chips and the flint nodules from which they had been struck. No trace of metal was discovered, and the evidence of the relics conclusively proved that these pits were dug by neolithic man with the object of obtaining flint from which to fabricate his tools, and that the pits themselves were the workshops in which he made them. Other interesting relics discovered were the horns of the large red deer converted into primitive picks, chisels, and wedges evidently employed by prehistoric men in digging the shafts and tunnels of the mines. After the revelation of the evidence of the mines, the problem presented to the excavators at Cissbury was the period of the entrenchment. This was successfully demonstrated by General Pitt-Rivers, to whose scientific investigations much of what is known of the archæology of the county is due. He observed that the southernmost angle of Cissbury Camp broke the line connecting the mines inside and outside the entrenchment. Digging sections through the ditch and rampart, he exposed the mouths of several of shafts through which the ditch had been cut, or over which the rampart had been thrown. This showed beyond doubt that the hill was used by the miners before it was occupied for defence, and that some at least of the shafts and galleries were made before the entrenchment.

Remains showing that the camp was occupied by a different race in far later prehistoric times were afterwards discovered in shallow pits in another part of the camp. Fortunately these, together with a large number of implements from the flint mines, are now in the Brighton Museum, and consist of pottery urns, bone combs employed in weaving, spindle-whorls, a chalk loom-weight, a peculiar looking hook and other iron objects. The latter are similar to the remains of the Early Iron Age found in Sussex and elsewhere, notably at the prehistoric Lake Village at Glastonbury in Somerset, and their discovery by Mr. Park Harrison forms an important contribution to the study of the archæology of this district. The interest of Saturday excursion was considerably enhanced by the discovery of several flint axes in the rabbit holes in the mouths of the pits and ramparts. Hundreds of the old artificial chips were seen on the surface, and Mr. Toms gave actual demonstrations as to how they were made.

ST. PAUL'S CATHEDRAL.

THE main drainage committee of the London County Council have prepared the following report :—

On February 5, 1907, we submitted a report with reference to the construction of the third section of the northern low-level sewer No. 2, and we then stated that "as the sewer will in its course pass to the south side of St. Paul's Cathedral, we have been in communication with the representatives of the Dean and Chapter with regard to the manner in which the construction is to be carried out at this point, and they are satisfied with the proposed arrangements." We now have to report the receipt of a memorial on the subject, signed by the trustees and the Dean and Chapter of the cathedral as follows :—

The Chapter House,
St. Paul's Cathedral, E.C.

To the London County Council—

The memorial of the undersigned, being the trustees and the Dean and Chapter of St. Paul's Cathedral, sheweth—

That grave doubts have recently arisen as to the consequences of the new sewer which it is proposed to construct under St. Paul's Churchyard, on the south side of St. Paul's Cathedral;

That the consideration of this question has for some time past engaged the most serious attention of the Dean and Chapter and their advisers;

That, since the last communication which passed between the London County Council and the representative of the Dean and Chapter, more facts have come to light and new measurements have been taken ;

That the Dean and Chapter and their surveyor have had advantage of the careful advice of three architects of the best experience and reputation, Mr. T. E. Collcutt (president of the Royal Institute of British Architects), Sir Aston Webb, R.A. (past president), and Mr. John Belcher (past president), and that they have furnished them with a report ;

That your memorialists have the honour to submit this report, and ask for its due consideration at the hands of the London County Council ;

That they are aware that the Bill for the proposed line of the sewer has received Parliamentary sanction, but that they consider that the gravity and urgency of the matter compel them to ask for a reconsideration of the case ;

And that your memorialists are strengthened by the belief that there is no question of serious public advantage involved which would cause the proposed line to be adopted rather than any other line between St. Paul's Churchyard and the river.

And your memorialists will ever pray, &c.

(Sgd.) RANDALL CANTUAR.

(Sgd.) W. P. TRELOAR, Lord Mayor.

(Sgd.) A. F. LONDON.

(Sgd.) ROBT. GREGORY, Dean.

(Sgd.) HENRY SCOTT HOLLAND.

(Sgd.) WILLIAM SINCLAIR.

(Sgd.) W. C. E. NEWBOLT.

The architects' report referred to is as follows :—
The Very Reverend the Dean and Chapter of St. Paul's Cathedral—

Gentlemen,—In accordance with your instructions we undersigned have made a very careful examination of the present structural condition of the cathedral, and the elements that have taken place from time to time, and we have been assisted by the reports of former surveyors and engineers, and we hope shortly to be able to make a full and detailed report on the subject. But in view of the imminent construction of a sewer by the London County Council within 45 feet of the south-west tower of the cathedral, we feel it our duty to furnish an interim report on this particular point, which has become so urgent and pressing.

We may premise by pointing out that the three portions of the building that have from time to time shown the most significant points of weakness are the south-west tower and south-west and south-east piers of the support to the dome. We find that there have been several proposals to construct a sewer on the south side of the cathedral in St. Paul's Churchyard. One commenced by the City Corporation in 1843 was abandoned on the danger to the structure being pointed out by the surveyor (Mr. Cockerell), though a sewer was actually constructed on this line in 1843 at a depth below the surface of 16 feet 3 inches (but a smaller one). A tube railway has recently been proposed, but this, for the present, has also been abandoned.

The present proposal of the London County Council is to construct a sewer running along the south side of the cathedral, and only 45 feet from the south-west tower at a depth of about 52 feet from the surface, and only 16 feet below the assumed surface of the London clay, and it is attended by very eminent engineers that if the sewer, which we understand will be nearly the size of a tube railway, is constructed in the clay with a shield, and protected by proper precautions and inspection no harm can come to the cathedral.

It is with great diffidence that we feel compelled to come to a different conclusion. But bearing in mind the great difficulty if not impossibility of complete and adequate supervision of a work of this character, and the disturbance it has undoubtedly been caused to surrounding buildings by works of a similar character in London, we are of opinion that the construction of such a sewer so near St. Paul's, after taking into consideration the present sensitive condition of the structure, might very possibly become a very serious danger to the cathedral fabric, and should therefore be opposed by the authorities by every means in their power, in order to secure another route for this sewer which would be free from any possible risk to the building.

We remain, gentlemen, yours faithfully,

(Sgd.) THOMAS E. COLLCUTT.

(Sgd.) ASTON WEBB.

(Sgd.) JOHN BELCHER.

(Sgd.) MERVYN E. MACARTNEY.

In order that the Council may be in possession of all the facts, we think it well to state what action we had taken to insure that the construction of the sewer should not endanger the fabric of the cathedral.

In 1904, when the route of the sewer was under consideration, it was found that the most satisfactory course which could be adopted would bring the sewer near the south side of St. Paul's Cathedral. Having regard to the importance of the building, we considered it advisable to communicate with Mr. Somers Clarke, the architect to the Dean and Chapter, on the proposal, and at his request, three trial borings were made in the vicinity of the cathedral for the purpose of ascertaining the nature of the strata, the sites for the borings being fixed by Mr. Clarke himself. Mr. Clarke then asked whether the Council would consent to submit the plan for the construction of the sewer at this point to an independent engineer acting for the cathedral authorities, and whether the works could be inspected during execution. This was agreed to, and the expense involved was borne by the Council.

As a result of the negotiations, a letter was received in May 1905 from Mr. Somers Clarke stating that he was authorised to say that, "advised by their engineers, Messrs. Barry Leslie & Co., the Chapter of St. Paul's does not regard with apprehension the proposed low-level sewer passing under the south side of St. Paul's Churchyard." Mr. Clarke also asked that certain suggestions made by Messrs. Barry Leslie & Co. as to the method of constructing the sewer near the cathedral should be adopted, and these proposals were agreed to. As we had already received a communication from the solicitor to the cathedral authorities assuring us that Mr. Somers Clarke had full authority to settle the matter on behalf of the Dean and Chapter, we felt satisfied that no further objection would be raised.

No further communication on the subject was sent to the Council until April 2, 1907, when the memorial above referred to was received. When we recommended that the work should be put in hand, therefore, we had every reason to believe that the Dean and Chapter had not altered their opinion in the matter, but in order that we might be confirmed in our assurance that no damage to the cathedral could result from the construction of the sewer at this point, we thought it advisable to consult an independent engineer, and we therefore asked Sir Benjamin Baker to advise us in the matter. Sir Benjamin Baker reported that, provided certain precautions were adopted, which precautions we had already arranged to take, there would be no danger in constructing the sewer in the manner proposed. As it appeared from the memorial, however, that the trustees of the cathedral, after considering the report made by the committee of architects, viewed with anxiety the proposal to construct the sewer under St. Paul's Churchyard, we at once acceded to their request that the matter might be reconsidered. We have had under consideration an alternative route by which the sewer would take a course longer than was originally proposed, at a greater distance from the cathedral, and as it appears that the adoption of this alternative would not detract from the efficiency of the sewer, but would obviate all question of damage to the cathedral fabric, we think that any additional expenditure which might be incurred would be justified, and we have therefore given instructions for the plans and specification for the construction of the sewer to be amended accordingly.

PROFESSIONAL IDEALS.*

A BUILDING like this is the best monument of what the twentieth century has accomplished. The really important part of the history of a nation is the development of its ideals and standards. The specific things that it does are important not so much for their own sake, but for the sake of the evidence they give as to the trend of a nation's thought. It is not the magnitude of the individual battles which makes a war worth reading about. It is the ideas under which the war is conducted and the constitutional principles for which it is fought. It is not the census figures which decide whether a nation is great or small. It is the industrial methods and educational ideals which these census figures indicate. And in like manner it is not the buildings and machines and railroads and mines which constitute the important part of the history of the engineer-

* An address delivered by President Hadley, of Yale University, at the opening of the Engineering Societies Building erected by Mr. Carnegie in New York.

ing profession. A book might give a good description of a thousand of these great engineering works, and yet fail of being in any sense a true history of engineering progress. The thought of the successive builders and the influence of that thought upon the conduct and ideals of other men are the things that we really care about. The story of the concrete achievements that have dazzled the eye of the world is but the unimportant and superficial part of the history. The real thing for which we care, the thing that helps us to understand the past and inspires us with hope for the future, is the story of the men who did the things, their struggles and their discoveries, their trials and their successes.

The men who did more than anything else to make the nineteenth century different from the other centuries that went before it were its engineers. Down to the close of the eighteenth century the thinking of the country was dominated by its theologians, its jurists and its physicians. These were by tradition the learned professions; the callings in which profound thought was needed; the occupations where successful men were venerated for their brains. It was reserved for the nineteenth century to recognise the dominance of abstract thought in a new field—the field of constructive effort—and to revere the trained scientific expert for what he had done in these lines. Engineering, which a hundred years ago was but a subordinate branch of the military art, has become in the years which have since elapsed a dominant factor in the intelligent practice of every art where power is to be applied with economy and intelligence.

A building like this is, therefore, the symbol of all that is most distinctive in the thought of the century that has gone by. A hundred years ago we might have had a building in honour of theologians or of lawyers or of physicians, but one that symbolised the achievements of the engineer was beyond man's dreams, because the world at large had neither felt the need of his work nor dreamed how soon it should be seeking his leadership.

I have spoken of this building as a monument, but that is, after all, not the proper word. A monument implies that a man is dead, or, at any rate, that he has so nearly reached the limit of his growth that he might just as well be dead. Looked at in this way, the engineering profession wants no monument. It has not yet reached the limit of its growth. It has not come to the time when a complacent survey of the past will take the place of toilsome planning for the future. Not a headstone do we want, but a milestone—a point at which our measurement of what has been already done serves as an inspiration for the journey yet to be traversed. We may take this opportunity for a brief review of what has been done in engineering and other allied professions, but the engineer who is worthy of his calling will value that review most highly if it is made a means of calling his attention to that which yet remains to be done.

A hundred years ago there was a sharp separation between scientific theory and commercial practice. There was not a great deal of science anyway outside of mathematics and astronomy, and what there was was underrated by men of affairs. In those days when a man said he was practical it meant that he was not theoretical, that he didn't know science, and didn't want to know it, and didn't want to have any man around that did know it. The men of that day trusted to two guides: inherited prejudice and individual experience. The more enlightened among them used experience to correct prejudice; the rank and file of them used experience to reinforce prejudice, and that was about all the difference. The value of generalisations, except in religion and in statecraft and in some few branches of medicine, was not recognised by anybody.

The great element of progress in the nineteenth century has been the recognition on the part of mankind in general of the value of scientific generalisations in every department of human conduct. Our science has become sounder, our understanding of its applications clearer; and the public has recognised that scientific conduct of a business means the substitution of universal experience, learned with difficulty and applied with toil, for the narrower range of individual experience which was at the disposal of the so-called practical men of fifty or a hundred years ago. Of this change the engineer is the representative and the leader. He it is who makes physical science in its various lines applicable to the complex problems of construction and development. He it is who has paved the way for the recognition of the technologist and the expert in every line of human industry. He it is who has shown how mathematics, instead of being

an abstract discipline, remote from everyday human affairs, may become the means of applying truths for a long time remote and undiscovered to the everyday affairs of the world in which we live. Not the buildings you have built, gentlemen, not the railroads that you have planned, not the machines you have invented, represent your greatest achievement. Yours is the proud boast of having in our brief century established science as the arbiter of the material affairs of mankind, and of having enforced his worship upon a world once reluctant, but now gloriously admiring.

What, then, you will ask, Is there anything which remains to be done comparable in importance to this? Yes, there is. An equally large part—perhaps in one sense a much larger part—of your professional duty yet remains to be accomplished. It is not enough to have technical training. It is not enough to know the special sciences on which the practice of a profession is based. A man ought to have clear conceptions of the public service which his profession can render and the public duty which its members owe. Thus, and thus only, can the engineer, the lawyer, the physician, or a member of any other learned profession, rise to the full dignity of his calling.

For there are two quite distinct qualities which must be combined in order to secure the best professional service. There are two quite distinct tests which work must meet in order to be pronounced first-class. One of these is the technical standard; the other, for want of a better word, may be called the ethical standard. The man who wishes to build a good railroad must not only lay it out according to the rules of the surveyor's art, with proper curves and grades and bridges which will not fall, but he must also have some intelligent regard to the needs of the population, the safety of travel and the many other factors which determine whether a railroad shall be a work of public use or a source of industrial bickering and financial disaster. This combination of public and private demands is not peculiar to engineering. It can be illustrated in every other profession of importance. It is not enough for the lawyer to give advice which shall be technically sound and which shall enable his clients to keep out of gaol. He must learn to take a large view of the law as a means of public service instead of private gain. It is not enough for the physician to know how to cure specific diseases. He must know how to care for the large problems of public health, and to use the resources of the community in a way to meet as fully as possible its sanitary needs.

This larger view of professional obligations is not so fully recognised as it should be. We have in the nineteenth century made so much progress in the technical training of doctors and lawyers and engineers that we sometimes forget that there is need of anything more than technical training. We have let the old idea of public leadership, which was prominent in the minds of the great professional men of past centuries, give place to another and narrower ideal which is fully satisfied when a man has made himself a technical expert. Many a man of real eminence in his calling deliberately rejects the wider conception of professional duty which I have here indicated. Perhaps he recognises the claims of public service, perhaps he does not; but in any event he believes that these claims rest upon him as a man rather than as an engineer or a lawyer. In his professional capacity he says he is hired not to tell what the law ought to be, but what it is; not to advise how a railroad can do the most public service, but how certain men with certain ideas of their own can best use the differential calculus to get those ideas carried out. This is perhaps the prevalent view of professional ethics to-day. I believe that it is a wrong view, which must menace not only the influence and standing of the professions themselves, but the general interests of the republic.

In the first place, a man who believes that he is hired to carry out another man's ideas can never claim a position of actual leadership. He remains a paid servant—high paid doubtless, because he is possessed of a kind of skill which is very unusual, but nevertheless a servant, bound to carry out the wishes of his master. A group of professional men which regards this as a proper view thereof forfeits the claim to stand in the first rank socially and politically, and voluntarily accepts a position of the second rank. I do not believe that the engineers of America want to do this. It has been said that engineering is the handmaiden of commerce; but I do not believe that the men who have planned and dedicated this building will be satisfied with any handmaidenly conceptions of what the

successors ought to do. If for a moment in our zeal for new technical developments we have let our responsibilities as public servants fall out of our hands, I feel sure that we shall be ready to take them up again as soon as our eyes are opened up to the real situation.

For mere technical achievement is not the thing that endures. Among the peoples of the ancient world I suppose that there were no engineers equal to those of Egypt. Considering the means at their command, the things that they did were absolutely extraordinary. They did some things which, even with the means at our command, we can hardly duplicate. But they used their abilities in the service of a dominant priestly caste, and therefore, while their work fills us with admiration, it does not appeal to us as does the work of the Roman engineers a few centuries later, who built roads and aqueducts and bridges, and thus took the lead side by side with the Roman lawyers in establishing the basis of modern civilisation. The roads and bridges of Rome, simple and straightforward as they are, constitute a more enduring monument to the Roman engineers than all the obelisks and pyramids that were ever erected.

For their own sake, then, and for the sake of the enduring quality of their work, we can appeal to the engineers and lawyers and physicians to see that it is adapted to public ends. We can reinforce this appeal by a yet stronger one on behalf of the American commonwealth as a whole, for the development of technical ideals and standards in our various professions during the last few centuries, to the neglect or exclusion of ethical ones, is constituting a very serious public danger.

A commonwealth like that of the United States is necessarily governed by public opinion. Courts may formulate this opinion, legislatures may pass rules to give effect to it, police may enforce its demands against the recalcitrant, but the governing power rests in the intelligent public opinion itself. When that opinion ceases to be intelligent and powerful, freedom becomes a mere name. Now a serviceable public opinion of this kind can only be formed when intelligent people technically trained for different lines of life seriously try to find out how their work can be made to meet the public needs. They are the only ones who can do this well. If it is done by anybody else it will be done badly. If the lawyers as a class try to keep the law in line with the demands of intelligent public opinion, we can get good law. But if lawyers are content to see the law perverted to private ends, and judges take refuge in technical construction of precedents without full regard to the needs of the existing situation, legislatures will step in to create a chaos of conflicting laws which are worse than no law at all. In like manner, if our engineers get their own minds clear, and get the public mind clear, as to the political economy of the properties entrusted to their charge and the ethics of their management, they can forestall those conflicts which now threaten to break out at every moment. But if the members of a profession whose advice is necessary in order to a clear understanding and wise settlement of these problems retire from the field of action, the matter will be settled by those whose interests are more selfish and less far-sighted. There are three professions to-day which do not regard themselves as servants, but as masters—the financier, the journalist and the politician. If the engineer and the lawyer accept positions as servants, simply putting their technical knowledge at the disposal of merchant, journalist or politician, who will pay the highest price for it, it is not simply a confession of inferiority, it is a dereliction of public duty.

Do you say that it is impossible for a single man or group of men to remedy these evils? Look at the career of Albert Finck who in 1874, when he was an engineer on the Louisville and Nashville R.R., made a study of the cost of transportation which has been at the basis of all the intelligent management of the traffic departments of railroads from that time to this. Of course Albert Finck was a rare man. He could do things that some of the rest of us cannot. But I verily believe that if our professions could awake to the necessity of broad ideals like those of Finck, the greatest dangers which threaten the American Commonwealth would be fairly met, and the men who met them would be given the positions of power and trust which they had proved themselves worthy to hold. Nobody is satisfied to-day with the struggle between individualism and socialism, between financier and politician, between Wall Street and Washington. The men who are engaged in this conflict are for the most part heartily sick of it. Let a man or group of men arise who add to their technical knowledge a readiness to use that knowledge

in the public service, and people will be ready to put them in charge of affairs and follow where they lead. We have outgrown the day when a little common sense was sufficient for managing the affairs of the nation. They are become too complex, and this complexity gives the engineer, if he will add to his training in mathematics a training in ethics and political economy and the fundamental principles of the law, an opportunity such as never before existed to claim and receive the position which rightfully belongs to him.

There arises now and then among our engineers a man with this quality of looking into the future—call it genius, call it insight, call it imagination. One of your own members said in a memorable speech that the thing that distinguishes a man of the first rank in his profession from a man of the second rank is the possession of this quality of imagination. Unfortunately it is rare. We cannot all of us have it. But we can have more of it than we now have if we will modify our training and widen our standards of professional success. Excellent as is the course in our technical schools, it does tend to have a narrowing effect instead of a broadening one. The ideals of our engineering societies are high, but they are not always as broad as they might be. The widening of the course in the schools and greater readiness in our associations to recognise services which we now call non-professional will, I am convinced, do more for the engineers and more for the community than would be represented by ten years' progress in mining or machinery and the various developments of applied science.

We celebrate to-day, and we are justified in celebrating, the recognition of science as a necessary guide in the conduct of the material affairs of each man's business. Half a century hence, when our descendants shall meet in this building or some greater building, I am confident that they will celebrate a yet greater thing—the recognition of the right of men of science to take the lead in enlightening the thought of the people on public affairs and the responsibility of filling the highest positions in the service of the Commonwealth.

NEW ROME.

IN his last report Mr. Consul Morgan says that after a somewhat protracted period of economic depression Rome was awakened to a new existence. The population of former times, who had never devoted themselves to business pursuits and who had but very imperfectly felt the necessity of doing so, have developed by gradual amalgamation with the new-comers from the rest of the peninsula and from abroad into quite a different race, largely composed of enterprising men, anxious to place Rome on a footing similar to that of other prosperous European capitals. Their first endeavours were directed towards rebuilding and modernising the old city, but at the outset inexperience led them to commit grave errors, with the result that they found themselves involved in a disastrous crisis which was ruinous to a great many people. A period of depression followed, but gradually the position began to improve. The population increased so rapidly that the new houses not only became fully tenanted, but a dearth of apartments is at present keenly felt, especially by the less-favoured classes of society.

Meanwhile the constant number of visitors drawn to Rome, either by reason of their health or for other motives, continued to spend large sums of money in the city, thus substantially contributing to the revival of its financial and economic conditions. The surplus capital of other centres, like Milan and Genoa, was also attracted as a matter of speculation, and with such assistance as the Government and municipal administration have been able to render the future of the capital of Italy was assured. Complaints are heard every now and then that Rome has been spoilt by the obliteration of some of the traces of the past; but it was felt by those who are in a better position to judge that archæology should not stand in the way of Rome's prosperity. All that could be preserved of the past of Rome was most scrupulously saved, and even now important schemes are under official consideration for the protection of the city's monuments.

The pretty small towns and villages near Rome are now served by a regular electric tramway service. The country is being gradually opened up and symptoms of activity are everywhere discernible. The two railway stations in Rome known as Termini and Trastevere are to be shortly connected by means of a direct line, and the workshops, as well as the stores connected with the railway service, will be transferred to the Trastevere station, thus relieving the present con-

gested Termini station. The cost of the undertaking is estimated at 250,000*l*.

The General Direction of the State Railways has purchased the Villa Patrizi, just beyond the Porta Pia, where all the railway business of Italy will be centred and transacted. In that connection it may not be amiss for me to remind travellers that all claims for compensation in respect of loss of property on Italian railways should, under the new arrangements, be addressed to the Chief of the Railway District (Capo del Compartimento Ferroviario) residing in the town from whence the said property was forwarded, provided its value does not exceed 40*l*. Claims for larger amounts should be addressed to the Direzione Generale delle Ferrovie di Stato in Rome. Claimants should not omit to attach to their complaint a list of the missing articles, giving the approximate value of each article.

Within the brief period of thirty-seven years Rome has been almost rebuilt, and by comparing a map of 1870 with one of the present time it can be seen at a glance that its topography has altered considerably. Strenuous efforts are being made to encourage the establishment of manufactories. The possible harnessing of a portion of the Tiber and of the waterfalls near Rome as a motive-power, the recent substantial 50 per cent. reduction on the import duty on petrol, the proposed reorganisation of the electric-supply service and other reforms of a wide public character, will undoubtedly exercise considerable influence in the attainment of the desired end.

Another important scheme which is receiving serious attention, and in respect of which a convention between the Government and the local municipal administration now awaits Parliamentary sanction, is the one relating to a new road to the sea almost parallel to the course of the Tiber. A small harbour is to be built on the left side of the river's outlet into the sea. Besides facilitating the conveyance of goods to Rome by means of the proposed approach to the capital from the sea, it is intended to convert the new harbour into a summer resort readily and quickly accessible from the capital by means of a regular electric-tram service.

PROTECTION OF SHORES FROM EROSION.*

THE constructive works which a foreshore engineer has to devise are groynes and sea-walls, or other fore-and-aft defences, where the land in rear of the foreshore does not afford the support necessary to hold up the bank of shingle or other drift. One most important matter to consider is that of the drainage of the land contiguous to the sea front. It is perfectly clear that with a foreshore such as that near Herne Bay, where tertiary clays and gravels are combined in varying layers, a wet season will work havoc with the line of cliffs. The water accumulates and lodges in the natural basin formed by the clay, and oozing through some fissure or vein of porous material, brings down great masses, especially after frost. Meantime, the fret of the waves at the foot of the cliffs tends to cut away the support for the cliff and accelerate land-slides. No measures of coast protection will prevent such weathering from above.

Along the East Anglian coast, where land-slides are disastrous in extent, a slipshod way of draining lands abutting on the sea prevails and materially assists the work of destruction. There is no inducement to a landowner to spend money on land which next year, or next month, may tumble into the sea.

Some coast lines are peculiarly liable to be disintegrated by frost. Chalk cliffs, provided they are nearly vertical, will resist this action for a long period. Moisture falling upon chalk land gets away quickly, chalk being a most absorbent material. The worst that happens generally, if the cliffs are vertical or nearly so, is a slight weathering of the skin of the face of the cliffs. Where, however, chalk headlands stand at a moderate slope, they are more likely to give trouble, owing to the percolation of the water into the fissures in them.

The sandstones do not come off so well. Many of the loosely-knit sandstones are liable to be split by water penetrating into veins, freezing, and thus wedging off great masses. This question, however, is rather alien to the immediate matter I am endeavouring to deal with, viz. coast defence.

At Bridlington, in Yorkshire, five "A" groynes were built in 1868, and two of them still exist.

At the top or sea-wall end the groynes were built 12 feet above the level of the foreshore, and at the bottom end 4 feet. The frames are 12-inch by 6-inch timbers filled with block chalk, and the sides are inclined to 35 degs. The piles are 12 inches by 12 inches and the planking 9 inches by 4 inches. This type of groyne embodies almost every principle to be avoided. Being built to an arbitrary level above beach level, such groynes accumulate drift on the windward side and cause deep steps in the foreshore, which are unsightly, inconvenient and dangerous. Being built almost broadside to the sea, they set up scouring forces of the most formidable nature, forces not of conservation, but of destruction. Lastly, the cost of a groyne of this type is of necessity heavy. Groynes of a somewhat similar type have been constructed at Trusthorpe and Ingoldmells, on the Lincolnshire coast. In that case the transverse section of the groyne showed five rows of piles each 7 inches square spaced 5 feet apart. The centre portion of the groyne rose about 3 feet above the sides, and the slope of the sides was 22½ degs. These latter groynes have retained the drifting sand, but on this part of the coast the sea is receding, and the problem is rather that of preventing inundation than of stopping erosion.

I remember an instance under which promenade works were built under these conditions. A contractor friend of mine who attended the inaugural luncheon of the sea wall from which the sea was withdrawing summarised the situation by saying that it appeared to be a case in which "the sea saw it and fled."

The type of groyne which, under normal conditions, I find most effective is that now to be shown. I have recently carried out the defences of a corporation in which the ravages of the sea were extreme, by building a series of groynes of this type. The piles are 10½ inches by 10½ inches, driven in pairs, 8 feet centre to centre, leaving a space for 4-inch planks to be bolted between. Owing to extreme severity of the conditions, the piles had to be about 21 feet long. The planks bolted between the piles are arranged to break joint. By carefully watching the accumulation or depletion of moving shingle and sand, and by taking off or adding planks, as the state of the foreshore indicates the necessity for doing, an effective sea beach can by groynes of this type be coaxed into existence. A few tides' neglect may, however, undo the accumulation of weeks.

These groynes have cost about 28*s*. per lineal foot to construct.

On less exposed coasts in which the piles need only be say 14 feet long, the cost of similar groynes is about 18*s*. per lineal foot.

Taking fifteen groynes to the mile and assuming each groyne to be 100 yards long, the cost per mile for groynes such as those at Hove and Hastings, which are massive and high and have oak ties, would be about 10,000*l*. Somewhat similar groynes, but with struts instead of oak ties, such as may be seen on the Cromer coast, cost about 8,500*l*. per mile.

Low groynes of the single pile type, like those at Felixstowe and Worthing, cost about 1,250*l*. per mile; and similar groynes, but with double piling, vary from about 1,500*l*. to 2,000*l*. per mile according to the length of piling necessary.

I may perhaps, in passing, mention that there have been several patent claims for groyning, notably that of the late Mr. E. Case, who was the engineer of the Romney sea defences, which are secured by the Dymchurch wall. His patent (1896) was, however, upset in the Court of Appeal. His method of constructing groynes was to fix uprights in pairs. They were of a light character and held in position in the beach by being concreted into excavated pits. The planking was bolted between the pairs of uprights. In the coast protection works at Dymchurch Mr. Case was undoubtedly highly successful. He advocated building groynes from the lower part of the foreshore upwards, but did not carry the groynes so far as the top end of the sea-wall, or other fore-and-aft protection work. This latter arrangement often results in dangerous scour round the head of the groynes, and, in my view, is undoubtedly a mistake. On exposed frontages the Case system has been of doubtful utility, as the concrete bases, into which the uprights are bedded, are liable to be scoured out. In this case the entire groyne comes to grief.

The effect of successful groyning on a steep foreshore is that the slope of the shingle forming the foreshore is flattened, and, in order to produce a satisfactory contour, it

* From the paper by A. E. Carey, M.Inst.C.E., read before the Society of Arts.

is therefore obviously necessary that shoaling should take place beyond the original line of low water. It is, therefore, necessary that the groynes should be carried below low-water mark, and this extension (when deep water originally existed close inshore) is the measure of the efficiency of the groyne. To extend groynes below low water it is either necessary to drive close sheet piling or to take every opportunity as the beach increases to add planking, and thus to push the structure seawards by degrees.

The advantage of the expedient of spur groynes (*i.e.* groynes running from a given structure parallel with the coast line) is one of which an instance may be seen immediately to the south of the entrance to Lowestoft harbour. A spur groyne is local in its effect. Its object is to afford protection to a short length of frontage, generally to some extent at the expense of the frontage to leeward of it. Where, for instance, entrance piers run out into the sea, on the windward side of which the travelling shingle is arrested, scour on the leeward side is a natural consequence. By means of a spur groyne the root of a leeward pier may be protected, as behind it shingle sooner or later gets driven and permanently lodges, being sheltered from scour by the spur groyne.

Turning now to the question of sea-walls, it is hardly needful to say that they vary in type within wide limits. As a rule, sea-walls are built fair on the face with a batter of 1 in 6 or 1 in 7. At Scarborough the sea face of the wall is curved to a radius of 17 feet, and the toe projects 15 feet beyond the bottom of the curve.

There are many other instances of sea-walls with curved fronts. I may mention that of Scheveningen, on a sandy coast. The apron of this wall is 20 feet long, it batters 1 in 4, and rests upon mattresswork and clay 18 inches thick.

Another common expedient, which has been adopted at Hastings and Blackpool, is that of having a projecting bull-head at the top of the wall. The idea of this design is that a column of water shot upwards under a wave stroke will be driven off at a tangent, away from the esplanade. So, to a large extent, it will, but the strain thrown on the wall is proportionately severe. Then there have been numerous designs for walls with stepped fronts, such as that for Bridlington and Margate. The Margate wall has a most elaborate contour consisting of a series of steps, each with rounded copes.

The idea embodied in the design of these various structures is that of breaking up the forces acting upon the wall and making the details of these forces mutually destructive. The forces operating upon a sea-wall consist of horizontal direct blows of the waves; these, by deflection, set up vertical forces acting upwards and similarly vertical forces acting downwards. The effect of the last is to excavate and tear out the root of the wall. The upward vertical force is one of the most fruitful sources of destruction, by reason of the cascade of water which thus passes over the sea-wall and scours out the filling behind it. It thus sometimes digs a trench into which the wall is capsized inwards.

The conclusions which I personally have arrived at are that to build sea-walling, unless under conditions which will result in its being well clothed with shingle or drift in front, is merely to court disaster. Such structures form admirable excavators. The weight of water rushing up the face of the wall will on recoil set up dangerous scour at the root of the wall. Many such a structure has come to grief in this way. It cannot be too much emphasised that the object of a sea-wall is that of forming a barrier for the travel of shingle inwards, rather than constituting a barrier for the wave stroke itself. Considered from this standpoint, it seems to me obvious that sea-walls of elaborate section involve a wasteful expenditure of money. The simplest and cheapest type appears to me the best. Such a structure is an ordinary wall of concrete, if necessary faced with granite, vertical on the front and stepped at the back. The best sea-walling, I may repeat, is a massed sea beach, and if sea-coast towns would be content not to push their building line so far forward, but to let nature build them a protection with the aid of a suitable system of groynes, they would, in nine cases out of ten, be in a far better position than they are when endeavouring to build sea-walls so as to encroach on the natural frontage of protection.

The latest practice in coast defence is that of dumping shingle artificially on a beach which has been depleted. The effect of this is often to restore efficiency and recreate a protective barrier. Some twenty years ago the sea-

wall at Hove, immediately after construction, was seriously endangered by underscour. Twenty-seven thousand cubic yards of shingle were brought from Shoreham by barge and deposited as close inshore as possible, groynes were constructed and the wall thus saved.

Similarly, between Newhaven and Seaford about 71,000 cubic yards of shingle were brought in railway waggons and tipped on to the beach between the groynes, and the result has been the successful protection of a length of low, exposed coast.

The question of coast erosion is one of urgency and of increasing urgency. The situation in many districts is so intolerable that some comprehensive national scheme must be evolved without delay. There are tracts of coast-line on which the invasion of the sea is a contingency continually present to the landowner and occupier. Slipshod agriculture is the natural consequence. The individual landowner may spend freely on defence works and find himself outflanked by the neglect—or more probably by the excess of zeal—of his neighbour. The principal areas of erosion are as follows:—

On the East Coast.—The Lias cliffs between Scarborough and Whitby, the coast line between Bridlington and Spurn Point (glacial drift), the East Anglian coast-line from Cromer to Clacton (glacial drift), the Kentish coast from Herne Bay to Ramsgate (mostly tertiary).

On the South Coast.—The Hastings sand cliffs near that town, the chalk cliffs between Newhaven and Brighton, points at the east and west ends of the Isle of Wight, the Oolite coast line between Swanage and Weymouth, the Lias cliffs near Lyme Regis.

On the West Coast.—Points in Bridgwater Bay, Somersetshire, in Cardigan Bay, on the North Wales coast near Colwyn, the Lancashire coast near Blackpool, and other localities.

A Royal Commission is now sitting to take evidence upon the entire matter, and is investigating the subject with admirable thoroughness. I have, at the request of this body, furnished a memorandum of the legislative measures which the present situation seems to me to call for.

My proposal is for the creation of two central bodies to deal specifically with the problem, one taking charge of the entire coast of England and Wales, the other of the entire Irish coast. Such bodies should act with much greater economy and efficiency than now obtain. The present *régime* of local control is often wasteful and sometimes actually pernicious. I suggest that the Coast Commissioners should take over the powers and functions of the various bodies now controlling sections of the coast under statute, and also the rights and powers of the Government departments affected. The body of Commissioners in each case should not, I think, exceed five, as any large representative body would only perpetuate the evils of the present lack of system. The Commissioners, I suggest, should be appointed respectively by the President of the Board of Trade and the Chief Secretary for Ireland. The Coast Commissioners would nominate and appoint district engineers or coast wardens, whose functions would be to advise the Coast Commissioners as to the measures necessary for the maintenance of their respective coastal frontages, and the execution of such works as might be ordered by the Coast Commissions.

I further suggest that the coast line of Great Britain might be conveniently divided into the following districts:—

1. Berwick-on-Tweed to the north shore of the Humber.
2. The south shore of the Humber to the Essex shore of the Thames.
3. The Kent shore of the Thames to Poole Harbour.
4. Poole Harbour to the Severn.
5. The Welsh coast.
6. The Dee to the Scottish border.

The Irish coast might be divided into three or four sections.

The administrative functions of the new bodies would be the investigation of the titles, rights and obligations of the various authorities, landowners and others claiming jurisdiction or rights over lands contiguous to high-water line and between high and low-water levels. They would have authority to stop the removal of shingle or sand from a foreshore; and I have suggested that, should it not be provable that such right had been exercised within twenty-one years, no compensation should be payable.

For the purposes of coastal defence my suggestion is that the Commissions should be the sole authority, with the proviso that their functions should be restricted to works

intended and designed primarily for the defence of lands and towns against sea erosion.

With regard to the thorny question of how the bill for the works carried out is to be met, my suggestion is that the salaries and expenses of the Coast Commissions and of their executive officers should be defrayed by an annual Treasury grant, and that the Treasury should further provide a capital sum to cover the plant necessary for the operations of the Commissions. This would be all that the Treasury would be called upon to find. The actual cost of works carried out by order of the Coast Commissions should, I think, be defrayed in respect of two-thirds by the County Council or Councils of the locality which includes the site or sites of the respective works, and one-third should be borne by the Corporations or local Councils whose frontages would be immediately affected. Public inquiries in every case would be held before any scheme of works was determined upon, and local views would thus be considered.

The main argument in favour of the suggestion which I have ventured to put forward is that a policy of prevision would take the place of the present lack of policy and of mere hand-to-mouth expenditure under panic.

The Coast Commissions would be able to utilise the surplus deposits of shingle and sand in one locality to make good the deficiency in another. It is on the maintenance of the circulating medium of defence provided by nature, either thus or by natural travel, that the security of the entire coast line depends.

There are various precedents for the formation of bodies such as I suggest, and the broad conclusions which I have arrived at are the results of long experience.

In conclusion, I desire to express my thanks for the attention which you have been good enough to give to my imperfect development of a wide subject.

One often hears it said, "Sea defence works are generally expensive; coast land is often cheap. Let the cheap land go." It seems to me that, from a national standpoint, such a creed is unworthy of the people whose race-character springs from the mastery of the seas.

GENERAL.

The Emperor of Russia has given a commission to M. Bernstamm, the sculptor, to execute in bronze his group of "Peter the Great Saving two Sailors," which appeared in the Salon of 1905. It is to be set up in the garden of the Peterhof Palace.

The Chantrey Trustees have purchased the following works of art from the Royal Academy's exhibition:—"The Rehearsal," by Mr. L. Campbell Taylor; "Runswick Bay" (landscape), by Mr. A. Friedenson; "The Seeds of Love" (water-colour), by Mr. W. G. Simmonds; and a small group in marble, "Earth and the Elements," by Mr. Bertram Mackennal.

The Design by Mr. Percy D. Lodge and Mr. Albert E. Dixon, both of Manchester, has been adopted in the competition for the Thornwood Avenue schools, Gorton.

The Belfast Quantity Surveyors' Society at their last meeting decided to reduce their fees for warehouse work from $1\frac{1}{2}$ per cent. to 1 per cent. The change has been approved of by the Ulster Society of Architects.

A Paper on "Two Benedictine Minsters" will be read by Mr. E. W. Harvey Piper at the meeting of the Society of Architects on Thursday next.

A Visit to "The Peel," Clovenfords, Selkirkshire, is organised for to-morrow (Saturday) by the Edinburgh Architectural Association.

The Worshipful Company of Makers of Playing-cards offer two prizes for the best designs for the backs of playing-cards, the first being 15*l.* 15*s.*, known as the Company's prize, the subject of the design to be "Imperial Unity," the second being 10*l.* 10*s.*, known as the H. D. Phillips prize, the competitor being at liberty to choose his own subject.

The Education Committee of the Durham County Council report that they have appointed architects to prepare plans for the following schools:—Blackhill, Chilton Buildings, Chilton Ferryhill, Chopwell, Cleadon, Cornforth, Fulwell, Hartburn, Silksworth, South Hetton, Willington and Witton Park. They invited seven architects to submit competitive plans for the new school at Blaydon, and received plans from six of them. Subject to the conditions relating to the competition being fulfilled, they have selected the design of Mr. J. Morson, of Durham.

The Prix Allier de Hauteroche, of the value of 1,000 francs, which is awarded at stated intervals by the French Académie des Inscriptions et Belles-Lettres, has on the present occasion been divided equally between Dr. H. Gæbler, of Berlin, and Dr. George Macdonald, assistant secretary in Edinburgh to the Scottish Education Department. Dr. Macdonald, who was Rhind lecturer in archæology for 1904, is honorary curator of coins to the Society of Antiquaries of Scotland. He has written extensively on numismatic subjects, but the particular work which the Académie des Inscriptions has selected for "crowning" is his "Catalogue of Greek Coins in the Hunterian Collection, University of Glasgow."

At the Adjourned quarterly meeting of the Belfast Corporation on May 2 some questions were asked in regard to the issuing of a writ by Sir Brumwell Thomas, the architect of the new city hall, for 13,000*l.* for fees. The Lord Mayor, in replying, said that the matter had been left to a sub-committee to see if an amicable settlement were possible. A writ had been served, and he imagined that in time it would go into the courts of law. So far as the sub-committee was concerned, they had not been able to come to any satisfactory agreement with the architect.

The Manchester Infirmary Board have been informed that the progress at the new Royal Infirmary is sufficient to justify the confident belief that the actual building will be completed by July next year, the date originally arranged for. Roughly speaking, one-half of the new hospital is now roofed in and water-tight, and the windows to some extent are fixed. A large amount of plastering has also been done, and the woodwork in the nurses' home is well advanced. The rate of progress at the work has been increased lately, and the payments to the contractor have gone up to 17,500*l.* per month. It is likely that the speeding up of the work will further increase the amount to 20,000*l.* a month.

The Edinburgh Dean of Guild Court considered last Friday an application from the North British Railway Company for a warrant to erect a water tank at Margaret's Works, Meadow Bank. Lord Dean of Guild Wilson asked if it were not possible to get another site for the tank. It would be a most desirable thing if it could be placed in a less conspicuous position. The representative of the railway company replied that no other site was available at that place. The Lord Dean of Guild said if that were so then warrant would have to be granted. The Court had no power to refuse it, but the tank would look a very hideous thing facing the public road. The tank, it is understood, will be about 90 feet in length and will stand about 15 or 18 feet above the pavement.

The Sheffield Town Clerk has been instructed to inquire from other municipalities what steps are being taken to meet the increased liability thrown upon corporations by the extended Workmen's Compensation Act. The town clerk in his report says, "The exact definition of workmen will probably not be fully known until after considerable litigation." The highway and sewerage committee of the City Council have had before them twenty-seven tenders for the construction of six settling tanks, twenty-four contact beds and other works in connection with the sewage works extension scheme. They recommend the acceptance of the tender of Messrs. Logan & Hemingway, of Nottingham and Sheffield, for 41,046*l.* For the laying-out of Fitzalan Square 11,618*l.* is to be borrowed.

A Course of Lectures, designed to meet the requirements of landowners and others interested in the production of timber and the preservation and extension of woodlands, is being arranged to be held in June and July at the Royal College of Science, Dublin. The lectures, which will be suitably illustrated, will deal with such practical questions as the present condition of Irish woods, the possibilities of extending our forestry operations, the classes of trees suitable for profitable cultivation, the conditions under which the several species should be planted and the treatment they require in order that they may afford an adequate return to the capital and labour invested in their production.

Mr. Thomas Rowbotham, the contractor engaged in the erection of the new Birmingham University buildings on the Bournbrook site, has offered to present to the University the clock, and, if thought desirable, accompanying chimes for the tower. The gift will represent a sum of about 2,000*l.* At the same meeting of the Council Sir John Holder expressed his willingness to contribute a sum of 1,000*l.* for the purpose of filling the large window at the south end of the great hall with stained glass.

THE WEEK.

THE improvements committee of the London County Council have issued a new statement containing the building conditions referred to in contracts for lease of the Council's surplus lands. The following marginal abstracts will suggest their character:—(1) Lessee to maintain support to adjoining land and buildings and to indemnify Council. (2) Lessee to build on lot permanent building and to expend minimum sum specified in particulars of the lot. Buildings to be built to be such as Council shall approve and not to build otherwise. (3) Lessee within calendar months after date of contract to submit to Council plans, &c., for approval. (4) Lessee not to execute any work or excavate until plans, &c., approved. (5) Lessee within two months after plans signed to commence building. Buildings to be built under inspection of Council's architect and in accordance with approved plans, &c., and completed within months after contract. (6) Lessee not to excavate beyond what is necessary for building works or without consent to remove soil, &c. Damages for breach. (7) Architect and others authorised by him to have access to lot for purposes of inspection, &c. Power for Council to require work, &c., not in accordance with approved plans to be removed and in default to remove same and make good at lessee's cost. (8) Lessee to keep buildings insured during erection. Power for Council to do so on default. Lessee to rebuild in case of fire, but architect may extend time for completion of buildings. Rent to be paid as if no fire had happened. (9) Relics, &c., found, to belong to Council. (10) Lessee to pay for use of half party walls. (11) Prohibition of advertisements without written consent of Council. Damages for breach.

THE Severn tunnel is one of the most important engineering works of our time. The plans were prepared by Sir JOHN HAWKSHAW, and the works were commenced in 1873 by the late T. A. WALKER as contractor. Before the works were completed the water on more than one occasion flowed in, and great difficulty was experienced in keeping the tunnel dry. Subsequently other works were undertaken. But at the present time there is water in the outlet shaft to within about 6 feet of the surface. The engineers have given a final certificate, and maintain that the contractor—Mr. DICKSON—has faithfully carried out his contract. Something will have to be done to remedy the defects, which probably are due to unforeseen natural causes. The Worcester City Council appear to be acting with great discretion. They propose that the engineers and contractor should agree to submit the problem to some engineer, to be appointed by the President of the Institution of Civil Engineers, in case they cannot agree upon a selection. The engineer is not to be considered as an arbitrator, but he is to decide whether the works correspond with the letter of the contract, and also to suggest the remedies which are considered to be effectual. He is to decide who is to pay his fees and the expenses which may be necessary in connection with his examination. It is by no means certain that the arrangement can be carried out. It is based on the theory that either the engineers or the contractor have acted erroneously. The City Council will escape all responsibility. But the history of engineering shows that there are contingencies which no foresight could have guarded against, unless by an expenditure which could never be repaid. That, apparently, has occurred at the Severn tunnel, and any liability must in equity fall upon those who are to be considered as the owners.

ON Tuesday there was a further step in the restoration of the west front of Hereford Cathedral, for the corner-stone of the south-west turret was laid by the Earl of WARWICK according to Masonic ritual. The work has been in progress since 1901, under the direction of Mr. J. OLDRID SCOTT. The Rev. Canon CHILDE in his sermon stated that 120 years ago on Easter Monday the western tower fell, and the destruction of the west front and part of the nave was the result. In 1788 JAMES WYATT was called in to carry out the reparation, and in no building in England was his peculiar system more markedly exemplified. It was supposed at the time that he was economically inspired. But it appears that no less than 20,000*l.* was expended on his experiments. His transactions consisted of the total rebuilding of the west front (without a tower), the foundations of which were moved 15 feet inward, and the nave consequently was as much shortened; the arcades and clerestory windows in the upper part of the nave altered from the circular to the pointed form; the vaulting of the nave renewed; the roofs of the nave, choir and transepts flattened; the spire taken down from the central tower; the battlements raised somewhat higher and the pinnacles with crockets placed at the angles. In 1841 another attempt was made at restoration under COTTINGHAM. But his improvements will not sustain modern criticism. In 1857 the work was placed in the hands of Mr. (afterwards Sir) GILBERT SCOTT, and after five or six years the cathedral was reopened. The great work of the west front was, however, as we said, not undertaken until 1896.

It is the fate of VITRUVIUS to be neglected and undervalued during several years, and then there is a sudden discovery by some scholar that his books contain more information than is generally supposed. The latest discovery is that the architect anticipated the modern taximeter, for in the tenth book there is a description of an apparatus which could be used by travellers on land and sea in order to ascertain the distance traversed. The particulars are given in sufficient detail, for a German mechanist has constructed one corresponding with the description of the ancient writer. It has been found to act when applied to the wheels of a carriage. Apparently it bore some resemblance to the hour glass, for there was a relation between the grains which passed from one part of the apparatus to another and the distance traversed. The incident has revived with scholars the circumstance that in the time of the Emperor COMMODUS carriages were in use to which an improved form of the taximeter was attached.

IRISH students of painting have in the International Exhibition such an opportunity as is rarely presented to them of studying modern British art. Pictures like MILLAIS's "The Rescue"; Lady BUTLER's "Roll Call" and "Scotland for Ever"; Mr. G. D. LESLIE's "School Revisited"; Mr. VAN HERKOMER's "Last Muster"; and Sir BURNE JONES's "Depths of the Sea," may all be said to possess historic interest. When they appeared each of them was the subject of much discussion, and in each case the painter triumphed over the critic. There are four paintings by Sir ALMA-TADEMA, "A Roman Family," "God Speed," "A Safe Confidant," and "The Kiss." Works by several other British artists are also to be seen, although they may not possess the peculiar attractions of those we have named. No doubt many lovers of art in Ireland will desire to have a few or more of the pictures retained. But it is difficult to see where the money could come from that would be necessary to buy works of English painters which have received popularity. Students of art will therefore be wise to enjoy the present time to the fullest.

SCULPTURE AT THE ROYAL ACADEMY.

ACCORDING to REYNOLDS, there is, or should be, only one style for sculpture in expressing form and character. The class of painting it resembled was the grand style; and the pleasure it afforded was in many respects incompatible with what is merely addressed to the senses. In other words, the President was opposed to the picturesque in sculpture, as well as to such dramatic expression as is seen in the face of *Laocoon*. Art has changed in several ways since 1780, when REYNOLDS expressed his theories, and he could not fail to be amazed if in vision he saw the variety among the examples of sculpture which appear in the Central Hall and the Lecture Room of Burlington House. Probably still more strange to him would be the number of men and women who follow the art in England.

As we have mentioned the *Laocoon*, we may mention that the group is recalled by Mr. THORNYCROFT'S *Courage*, which is part of a public monument. Instead of a father and two sons we have a mother and one child. She is seated, and while holding the serpent with one arm raises a large scimitar with the other to strike it. Unlike the ancient work, the woman's face is perfectly calm. As an example of courage we consider the group, excellent as it is, somewhat fails, for with such an arm and such a weapon the snake appears to have little chance. As an exhibition of courage, Lord LEIGHTON'S *Athlete* was more expressive, for in this group the woman appears perfectly at ease. Another group is the late *Canon Major Lester*, by Mr. FRAMPTON. It will bear comparison with FRÉMIET'S *St. Vincent de Paul*. The great folds of drapery in the cloak are better adapted for a public statue than the numerous folds which for a time were preferred by sculptors. In the centre of the hall is the seated figure of the *Marquess of Salisbury*, which is to be erected at Hatfield, and which is also by Mr. FRAMPTON. The statesman is represented wearing a chancellor's robe, which is boldly treated, the ornament being in delicate relief; and the peculiarly placid expression of the face was no doubt considered desirable for a statue to be placed so near his home. It is novel to find full-length figures of three Indian princes in the hall. Mr. W. R. COLTON represents *Sir Sheshadri Syes, late Dewan of Mysore*, and *H.H. the late Maharaja of Mysore*, in bronze, and therefore the jewellery, braiding, ornament and feathers are shown with great exactitude. Mr. GOSCOMBE JOHN'S figure of the *Maharaja of Balrampur* is in marble, and therefore a different method of treating the indispensable ornaments is adopted.

Electric-light standards and electroliers have given rise to many experiments. Mr. NICHOLSON BABB'S base of a standard, which is to be executed under the terms of the LEIGHTON bequest, is an interesting example. The cupids which are introduced are modelled in excellent style. Mr. WHITNEY SMITH'S *Drinking Fountain* is novel, for a fine figure of a girl holds aloft the model of a boat, out of which we suppose the streams will run. Immense energy is expressed in *Amor Victor*, a relief by Mr. GILBERT BAYES. If Mr. TAUBMAN'S colossal bust is really representative of Canada, invasion of the colony would be a dangerous game. Mr. DRURY'S *Lieut.-Col. McCarthy O'Leary* is admirable in its energy, and if compared with the Indian princes will suggest the influence of race. REYNOLDS, who disapproved of expression in sculpture, might not approve of Mr. REUBEN SHEPPARD'S *Music of Death*. But the pathos of the group is undeniable. Another group that is particularly expressive of the sculptor's art is *Man and the Ideal* by Mr. RICHARD GARBE. The figure of the woman is charming. A well-modelled figure is the *Wounded Warrior*, by Mr. FLEMING BAXTER, although some may object to the effort of withdrawing the arrow from the foot. As long as sculpture is practised we suppose Greek subjects will be in favour. Mr. TOFT'S *Antigone* is a most interesting attempt to suggest a painful subject—the entombment

alive of the faithful but unhappy daughter of OEDIPUS, and he has treated it in such a way that beauty rather than terror prevails.

In the Lecture Room Mr. BROCK'S *Motherhood*, a half-size model of a portion of the national memorial to Queen VICTORIA, will at once attract. The group is treated with a simplicity and breadth befitting the subject. The children are true to nature, and appear as if they were not posed. Mr. SWAN'S *Orpheus* is a bronze group. He stands on a rock which a pair of leopards are endeavouring to ascend, fascinated by the music. It is one of the important works of the year. *The Elfe's Music*, by Mr. ANDERS OLSEN, shows a figure with the whole weight thrown on one foot in effective style. There cannot fail to be difference of opinion about Mr. DERWENT WOOD'S *Atalanta*. It represents a comely woman, but whether the legs are suggestive of an athletic runner may be doubted. It was generally accepted that memorial figures of bishops of the English Church should simply represent them in the quietude of death. Of late years there appears to be a preference to depict them as living men. Mr. POMEROY'S *Bishop Ridding*, for Southwell Cathedral, shows his Lordship in his cope praying with his arms outstretched. At a distance it might easily be taken to be "St. Francis receiving the Stigmata"—a subject often selected by Italian painters. Demonstrative devotion is not a characteristic of the English clergy any more than of the English laity. And although the figure is ably executed, we trust it will not be taken as a precedent for imitation.

Mr. BASIL GOTTO'S bronze statue of BACCHUS shows not only skill but courage. The "jolly god" does not merely pose with a cup in his hand: he is a beneficent being who is not ashamed to carry the wine-skin, and, judging by the expression of his face, has deigned to share the contents with his votaries. There may not be warrant for the interpretation in Greek figures, but it is expressive of modern ideas, and it is to be hoped Mr. GOTTO will again visit Olympus. All lovers of stately prose must envy the possessor of Mr. H. PEGRAM'S reduction of his large statue of Sir THOMAS BROWNE, M.D., in which the Norwich physician is seen contemplating the fragment of a Roman urn which he was to make immortal. In the relief *Perseus delivering Andromeda* Mr. PEGRAM has attempted a subject over which many artists have failed. We must, however, allow for the limitations of sculpture. ANDROMEDA is supposed to be chained to a rock. But it is not quite clear how the monster could have found its way between the rock and the victim. PERSEUS is also compelled to come so near that one of his feet treads on the monster's neck, and the head of MEDUSA is so close as to form a contrast with that of ANDROMEDA. The sculptor has turned all these difficulties to account, and the scene appears to have as much animation as any painted representation of it. General BADEN-POWELL'S *Captain John Smith* is a bust which is remarkable as coming from an amateur. Mr. ALFRED GILBERT'S *Mors Janua Vitae* might have been inspired by one of the Etruscan terra-cotta tombs, although the beauty of the faces of the man and woman is of a far higher character. A gilded shrine forms part of the composition, and the panels express more of the artist's intention. The *Spirit of Ivy*, by Mr. DAVID BROWN, is interesting, and a figure of *Andromeda*, by Mr. B. CLEMENS, might have been intended to serve as a pendant to it. Some of the largeness of WATTS'S painting will be found in Mr. F. BAXTER'S *The Dray*, a group. The staff of office, Marischal College, Aberdeen, in silver, ivory and lapis lazuli, is an interesting example of applied art. It is executed by Mr. H. WILSON with great delicacy, and has, moreover, the advantage of not being burdensome to an aged principal.

It is needless to say there are numerous busts which are likely to be even less appreciated than the portraits in oils in other rooms. There are also many statuettes, a class of sculpture which deserves ample encouragement—especially if some enterprising trader would undertake reproductions of them as in France and

Germany. And in the Lecture Room there are several well adapted for that purpose. It should also be mentioned that in one of the galleries there is a small group by Mr. BERTRAM MACKENNAI called *The Earth and the Elements* in marble, in which the RODIN system allowing part of the block of marble to remain is adopted. If it is intended to suggest that all things are originally derived from a common material, the treatment is allowable. Otherwise the contrast is too violent for a work of art. Near it is a fine statuette in bronze, ivory and enamels, by that able decorator Mr. REYNOLDS-STEPHENS, called *Guinevere's Redeeming*, in which the queen appears in a robe which bears some resemblance to a nun's, while at the base are minute figures suggestive of her fall.

VERSAILLES.

WE suppose there are few Englishmen who are not disappointed when for the first time they see the Palace of Versailles. And yet during the present holiday season it should not be omitted by anyone who makes a little tour to Paris. So much has been said in histories about negotiations with LOUIS XIV. in the palace, and scenes in it have been so often described by DUMAS, it is quite natural that imagination should create buildings which no masons could construct. It would be difficult to explain all the reasons for the disappointment. Symmetry was a dominant principle with MANSART, and it has been carried to an extent that is remarkable at Versailles. The majority of visitors who go to the palace from Paris see the buildings around a large parade-ground, and there is no sign of that esteem for vegetation which is one of the characteristics of Frenchmen. Compensation for this is no doubt found when the buildings are seen not from the entrance of the Cour de Statues, but from the magnificent gardens which should be regarded as the true foreground for the buildings.

It should also be remembered when criticising the groups that MANSART was not allowed as free a hand as he desired. With all his egotism and his weakness to believe that his flatterers had reason to consider him as more than mortal, there were moments when LOUIS XIV. could not free himself from the influence of ordinary affections. Although he was only fifteen when his father died he held in reverence the buildings which LOUIS XIII. had erected, and all the reasoning of MANSART against their incongruousness was without avail. LOUIS XIV. insisted that the buildings should be preserved. And it must be said that a great many visitors at the present time approve of his resolution.

The site, although adapted for such a château as served for LOUIS XIII., was too low for the assemblage of buildings which became necessary under the new régime. It is generally believed that LOUIS XIV. wished to show his superiority over his Minister, FOUQUET, by the difference between Versailles and Vaux. Land was obtainable by the king. But water was required, not only for the use of the inhabitants, but for the fountains which were to become a feature in the landscape. According to RACINE, who held office under the king, over 30,000 men were employed upon forming conduits from several distant sources. Labour, in fact, seemed to be unlimited. It is recorded officially that at one time 36,000 soldiers were engaged on the earthworks for the terraces, and they were assisted by 6,000 horses. No care was taken about sheltering the labourers, and it is supposed that thousands perished from the hardships which had to be encountered. It may be doubted whether so many men were lost by building operations since the times of the Egyptian kings.

If we recollect the circumstances of the time, the power which LOUIS XIV. possessed over the lives and fortunes of his subjects and the baseness of the courtiers, it is difficult to avoid wondering at the regularity of the plan. Suggestions were always forth-

coming. New requirements were continually arising. Changes were occasionally approved, and yet on the whole the general plan seems to be methodical, as if the king had withdrawn from France and had resolved to avoid seeing Versailles until the works were completed. The explanation of this phenomena must be found mainly in the resolution of JULES MANSART and LENÔTRE. Admiration for their decisive character should, at least with architects, outweigh the monotony which is often thought oppressive.

Versailles when completed became the principal residence of LOUIS XIV. and his court. Indeed, as one wanders through salon after salon bearing strange names, some of which were adopted at a later time, one wonders to what kind of organisation they were adapted. Writers of romances are careful to avoid references to the rooms in which transactions took place, and indeed it would be a superhuman task to try and repeople the palace as it was in the days when the great monarch presided in it. But its completion synchronised with the zenith of his power. Then came a change. LOUIS XIV., or rather his subjects, had to pay the penalty of misgovernment, and in the latter years of his life he had to see many of his treasures in gold and silver carried off to be converted into money, as a small contribution towards the expenses of the wars in which he had engaged. He died in 1715, and it could be said without any exaggeration that never afterwards was the palace more than a costly and useless memorial of the magnificence of one king. LOUIS XV. was only a child of five when he succeeded to the throne. In subsequent years he could not afford the cost of keeping up the palace, although some additions were made by GABRIEL. There was not enough money available to pay for keeping the whole of the buildings in a sound condition. Under LOUIS XVI. the Jeu de Paume or racquet court attached to the palace was the scene of the first important act of the French Revolution. To NAPOLEON when he became emperor Versailles was only a sort of white elephant, which he often cursed, for he preferred to erect his own architectural memorials.

When the Bourbons returned to power it was expected that Versailles would be restored to its pristine splendour. Then as often before the puzzle was to discover money. The sums expended during the reign of CHARLES X. were not sufficient to restore the gilding. Royalist families who had suffered by the Revolution when they came back from exile found a refuge in the palace. To accommodate them the immense rooms which were only adapted for spectacles were divided and subdivided. As sanitary regulations were not adapted for such a multitude, anyone who reads about the occupation of that time must wonder there was not an outbreak of plague which would have decimated the inhabitants of the adjoining town. When LOUIS PHILIPPE in turn ascended the throne it was proposed to make the palace a second Invalides. But the king could not tolerate such a degradation of a royal creation. He thought he would meet the popular demand for utilising the buildings, and at the same time flatter the national spirit, by making of it a museum consecrated to the glory of France. The time of the warriors had passed. It was now the turn of the artists. There is no doubt that a sum of at least a million sterling was expended by the king's order. It is believed that over 4,000 paintings and 1,000 busts and statues were introduced. Then the history of France was illustrated to an extent that was without parallel. Enthusiastic Frenchmen may in their hearts enjoy those pictures, but as far as can be judged by a stranger there is no demonstration of their pleasure. There is an old story of an Italian prisoner having the option of the galleys or reading through the history of Italy by GUICCIARDINI, and he preferred the galleys. We consider that the study of the dullest history of France would be an easier task than the following of the series of historical paintings in Versailles and duly marking them off in a

catalogue. No doubt many of the paintings have become discoloured, and few of them are adapted to the fierce light which shines through the tall windows in the principal rooms. The works are all original, but we doubt if any gallery in Europe where forgeries prevail is so wearisome to the visitor. What appears to make them worse is that the furniture and ornaments in a great many of the rooms are beautiful. But the terrible background of pictures diminishes their interest.

The present Government, although apparently indifferent to ecclesiastical buildings, has in an especial manner taken the palace of Versailles under its protection. Although water appeared to be everywhere in abundance, not a drop could be used without the greatest difficulty for the extinction of fire. A danger of that sort was never contemplated by MANSART, and no provision was made to meet it. A special water supply has now been arranged, and water from a height of about 200 feet above the level of the entrance court can be applied in any emergency. In that way all the attics can be controlled.

Nearly two centuries have elapsed since the death of LOUIS XV., and as we have above suggested, during that time there has been more or less neglect at Versailles. Accidents would occasionally arise to furniture, statues, vases and other embellishments. There was no authority to dispose of such things or to repair them. They were therefore put aside in out-of-the-way rooms which even officials did not care to visit. The present curator, M. DE NOLHAC, is more adventurous. He has investigated the lumber-rooms and, naturally, has concluded that he has discovered treasures. He has obtained the sanction of the Fine Arts Department to form a new museum of those survivals of a former age. No doubt they will excite curiosity for a time. But when one considers the dreariness of Versailles with its multitude of contents in a perfect state, fear and trembling must arise at the thought of an immense collection of fragments. French skill in arrangement may, however, make an attractive show out of them. But the mere idea of such a creation is likely to make a visit to Versailles more embarrassing to the ordinary sightseer. And yet such a collection must seem to point the moral of a building which for the glory of one man entailed misery and destruction on multitudes.

PRECURSORS OF THE ROYAL ACADEMY.*

THERE is evidence enough to suggest that at one time paintings as well as other works of art were sold in fairs and places of public resort. The majority of artists occupied humble dwellings in which their productions could not be seen advantageously. Modern exhibitions are a development of the older system of public exposure. Painters and sculptors send their works to them with the object of attracting purchasers. It happens, however, that this purpose is ignored by a great many. Pictures are treated as if they were challenges to the public demanding admiration. As a consequence, critics endeavour to discover the defects rather than the merits of the works which are to be seen. Very little protection is allowed to the artist. He may be libelled as an impostor who casts a pot of paint in the face of the public, and should he seek redress the Courts will allow a farthing as compensation for the injury. If the same critic were to mention a vendor or manufacturer of colours and allege that his paints were worthless, damages not of a farthing but probably of 1,000*l.* would be awarded. In other words, artists by separating themselves from the old limners and makers of images have attained a position which is not without its disadvantages.

In France a paternal monarch allowed a large number of artists to use the big galleries of the Louvre in order to make a show of their works. To increase the interest in them DIDEROT and some other writers wrote articles about their attractions. In England no care of that kind was displayed. The painters were left to sink or swim like ordinary tradesmen. The value of exhibitions was for long unrecognised either by painters or by the public. Like much else which is important among us, accident had much to do in their creation. Pictures were purchased, but they were private transactions, for a man went to a portrait-painter, sign-painter, or a dealer in the same way as he went to his tailor, without any thought that he was doing more than gratifying himself. The patronage of art at the early part of the eighteenth century was a satire on the education of English gentlemen. In 1737 it was said that shiploads of *Dead Christs*, *Holy Families*, *Madonnas* and the like were imported and purchased at high prices. People looked on pictures as they would on hangings, and yet some were willing to give a year's revenue for a work which was supposed to be valuable because a famous name was inscribed on it.

While art was in so low a condition HOGARTH presented to the Foundling Hospital, which then stood in Hatton Garden, a portrait of the founder and a design for an emblematical decoration which was placed over the entrance. Other artists offered to contribute, and in 1746 nineteen artists were in return for their gifts elected as Governors of the Institution. The pictures consisted of four scenes from sacred history, views of other hospitals in London, the *March to Finchley* and some portraits. The novelty of the spectacle made the hospital attractive to people who had few opportunities to see pictures, and the painters gained a notoriety which it was expected would lead to profitable results to themselves. Having succeeded in benefiting the foundlings it was considered that equally worthy objects of charity could easily be found. It was therefore proposed that an exhibition of the works not only of painters, sculptors and architects, but of engravers, chasers, seal-cutters and medallists should be held once a year. The admission was to be 1*s.*, and the money applied towards the support of artists who through age or infirmity or other lawful hindrance were no longer "candidates for fame." Application was made to the Society of Arts for the use of the great room during a fortnight. But the Society could not approve of the charge of fees for admission. It was therefore decided to allow the public to be admitted gratuitously but to be charged 6*d.* for the catalogue. The exhibition was held in 1760. Sixty-nine artists contributed between them 130 works. Six thousand five hundred and eighty-two catalogues were sold. With the money received, viz. 164*l.* 11*s.*, expenses amounting to 58*l.* 12*s.* 6*d.* were defrayed, 82*l.* 2*s.* 6*d.* purchased 100*l.* in Consols and there was a balance of 23*l.* 16*s.* The exhibition had hardly closed when differences arose about the laying-out of the balance. Some artists wished that it should be applied to the advancement of art rather than to charity. Eventually it was decided to allow the money to accumulate until 500*l.* was acquired through succeeding exhibitions, and then to leave the disposal to the vote of the majority.

It was proposed to hold a second exhibition in June 1761, with the price of the catalogue raised to a shilling, and that no person was to be admitted without one. The Society of Arts would not approve of the alteration, and insisted that the exhibitions should be free and open to the public. Accordingly an agreement was entered into with an auctioneer for the use of a room in Spring Gardens. But before the time of exhibition had arrived the differences between the artists extended so far that two bodies were formed. There were, in consequence, two exhibitions in 1761—one at the rooms of the Society of Arts in the Strand, and the other at the great room in Spring Gardens. In 1762 the exhibitions were again held, and continued until 1768, when

* *The Society of Artists of Great Britain, 1760-91. The Free Society of Artists, 1761-83. A Complete Dictionary of Contributors and their Work from the Foundation of the Societies to 1791.* By Algernon Graves, F.S.A. (London: George Bell & Sons.)

the Royal Academy of Arts was constituted. The two societies, in fact, exhibited until a later period, although under different conditions, and with a new rival in the Academy Exhibition. In other words, there were a great many people who approved of one of the societies from having charitable intentions, while others upheld the endeavour to attain independence without royal support.

Mr. ALGERNON GRAVES, having completed his most useful "Dictionary of Exhibitors at the Royal Academy," has had the courage to treat the exhibitors of the two societies in a uniform manner. It is possible to obtain occasionally, although at much cost, a set of the Academy catalogues. But printed copies of the earlier exhibitions are not to be discovered, and, indeed, Mr. ALGERNON GRAVES's volume had to be compiled from manuscript volumes prepared thirty years ago. Some of the artists and their works are forgotten, and Mr. GRAVES has endeavoured as far as possible by research to obtain information concerning them. He has also given an index to the portraits as well as to the owners of buildings, &c. Altogether he has produced a work which, if complete in itself, becomes a necessary complement to the Academy catalogues.

In those old days the boundaries of the province of art were not laid down definitely. We must therefore expect to meet with entries which would surprise the committee of the Royal Academy in our time. Needlework, for example, took the place of etching. *William Penn's Treaty with the Indians* and *The Death of General Wolfe* after WEST's pictures were favourites with ladies. Landscapes in oil, with trees and shrubs in seaweed, were supposed to be attractions. Indeed, landscapes in seaweed were numerous. Architecture made up of shells as imitations of Classic examples could also be seen. One example consisted of "Eight Corinthian pillars of white shells with flowers twisted round them and urns over them supporting a dome." Hair was another material much employed. "Three Ladies adorning the Tomb of their Father: a bracelet in human hair," was to be seen in 1765. Another work of art consisted of "Two portraits, a sea-storm, a figure of Hope, and a basket of flowers, wrought with a needle on silk in human hair." Paper-cutting was also accepted as art. One lady exhibited "A frame of various devices, cut in vellum with scissors, containing the Lord's Prayer, with her name and the date of the month and year, in the compass of a silver threepence." We may smile at such entries, but they possess an historical interest. It may have been with such things that Dr. JOHNSON was bored when he visited the exhibitions, although it is generally assumed he was unable to comprehend the paintings and sculpture.

There was, of course, much which was important in both series of exhibitions. REYNOLDS favoured the Society of Artists between 1760 and 1768. And among the pictures exhibited were *Sterne*, *Lord Ligonier*, *Garrick between Tragedy and Comedy*, *Lady Waldegrave as Dido*, *Nelly O'Brien*, and *Lady Bunbury sacrificing to the Graces*. GAINSBOROUGH at first contributed to the Society of Artists, but from 1774 to 1783 he gave his aid to the Free Society. ROMNEY supported both societies. In the Free Society's exhibition of 1763 was his *Death of General Wolfe*, which that year gained the prize of twenty-five guineas from the Society of Arts. BENJAMIN WEST exhibited at the Society of Artists from 1764 to 1768. WILLIAM HOGARTH, who was so closely connected with the founding of the Society, exhibited only in 1761. In that year were seen his *Sigismunda*, *Gate of Calais*, *Picquet or Virtue in Danger (the Lady's last Stake)*, *An Election Entertainment* and three portraits.

The architecture has, of course, more interest for us. It is satisfactory to know that the art was recognised in 1761. In that year, besides the model of a candlestick, CHAMBERS exhibited a triumphal bridge at Blackfriars, a triumphal arch at Wilton, and a London house for a person of distinction. He ceased exhibiting in 1768. JOHN GWYNN in 1760 contributed a design for galleries

to contain the Arundel marbles in Oxford, and one of three designs for Blackfriars Bridge. In 1761 he sent "A design for a triumphal arch, in lieu of a transitory fireworks, to celebrate the successes of the present war and the re-establishment of peace. (The said arch may be commodiously erected either at Hyde Park Corner or Holborn Bars, supposing Middle Row as a public nuisance taken away.)" JAMES STUART (STUART & REVETT) between 1765 and 1783 showed several drawings from his "Grecian Antiquities" and other work. Besides, there were drawings which were not architectural, designs for medals, sketches of pictures, models, &c., which testified to his versatility and industry. ROBERT BALDWIN, who from having the "Bridge Office, Black-Fryars," as one of his addresses, was probably an official architect, sent in 1783 "A design for the safety and execution of criminals, detached from the Gaol of Newgate by a subterraneous passage," which was an effort to avoid the disgraceful spectacles then common. JOHN CARTER's drawings were mainly of Gothic subjects, but in 1777 were three pictures showing the history of a Young Cavalier in 1642. One of the busiest architects of the time (1761-78) was JAMES PAINE, who was once clerk of works at Greenwich Hospital and architect to the king. He prepared designs for buildings for the Duke of DEVONSHIRE, the Duke of NORFOLK, Lord ARUNDEL, &c. Several bridges were among his works. He was architect for Salisbury Street, Strand. JOHN JOHNSON, who was for a quarter of a century architect and surveyor for Essex, exhibited in 1775 a design for two houses in Cavendish Street, Cavendish Square. He was then in his twenty-first year. He possessed influential clients. One of his works was the "Quadrangle Prison" in Essex. JOHN VARDY was one of KENT's pupils, and was clerk of works at Whitehall, St. James's, Westminster, and Hampton Court. He exhibited designs for a building for the "Society of Dilitanti, 1751"; the British Museum, 1754; a royal palace at Whitehall, 1748; the north front of St. James's Palace, 1758; King's Bench, 1753, &c. He was architect for Lord SPENCER's house, in St. James's Place. GEORGE DANCE, whose excellent profile portraits were lately exhibited at the Royal Academy, was a young man when he exhibited his design for the "Bridge at Blackfryars" in 1761, to be followed next year by perspectives of St. Leonard's, Shoreditch, and the Mansion House, both buildings having been designed by his father.

There was more sculpture shown than was to be expected. Master JOHN FLAXMAN was represented in the exhibition of 1768 at the Society of Artists by two works in wax, viz. *The Death of Julius Cæsar* and *The Marquis of Granby*. To the Free Society he earlier contributed large models of *Hercules* and of *Omphale*, a *Minerva* bust and *The Assassinating of Julius Cæsar*. FLAXMAN was twelve when he became an exhibitor. ROUBILIAC's first design for the *Shakespeare* in the British Museum was seen in the exhibition of 1760. JOHN BACON was another exhibitor. The early works of BANKS—*The Ransoming of the Body of Hector* and the *Judgment of Perseus*—were shown at the Free Society.

In the last catalogue of the exhibition of the Free Society for 1783 it was stated that "this Society claim the merit of being the first who produced an exhibition in this country; it ranked amongst its exhibitors the most respected painters, engravers and some of the first architects; but the fascinating charm of a royal exhibition induced many to desert it, and the false delicacy of some was hurt by the plan being founded for the purposes of charitably contributing to relieve the distresses of their brother artists. The public, however, had seen the institution in its proper light, and from the first to the last have afforded the warmest encouragement, and not withheld their powerful patronage." The Society of Artists separated from the Free Society, and by some fatality the whole career of the former was disturbed by dissensions.

If HOGARTH had lived his strong common sense must have prevented some of the disunion, and in that case it is quite possible that the foundation of the Royal Academy might not have taken place, or would be delayed. The Society had the great advantage of having a preface by Dr. SAMUEL JOHNSON to their catalogue, which announced that the purpose of the exhibition was not to enrich the artists but to advance the art. A curious proposal was, however, announced by the Doctor. Many artists, it was said, of great abilities were unable to sell their works; they were invited to send them to an annual sale which would be conducted by the exhibition committee. A price was to be secretly set on every piece. If more was given the artist was to be the gainer, but if purchasers offered less the artist was to be paid the deficiency from the profits of the exhibition. The difference between the two societies therefore simply related to the class of persons who were to be benefited by the profits of each year's show.

Many of the works which were seen in the two exhibitions must still exist, and it cannot be supposed they were all valueless. Mr. ALGERNON GRAVES's volume furnishes clues which will help towards their identification, and no doubt many amateurs and speculators will be able to derive advantage from the pages. For those who feel an interest in the history of modern English art the book will be invaluable, for although it may be supposed we never had a school of painting in this country, yet a substitute was found for it in the competition which took place in connection with exhibitions; and the earliest which were organised were those of the two rival societies.

ARCHÆOLOGY IN DURHAM.

THE annual meeting of the Archæological and Architectural Society of Durham and Northumberland was lately held. The venerable Dr. Greenwell presided. In the course of his address, according to the *Durham Advertiser*, he congratulated the Society on the excellent volume of Transactions now out. The cathedral had been lighted with electricity since last year's meeting, and he thought it might have been better done. He was extremely sorry the Dean and Chapter did not utilise those very fine chandeliers that they had, of which two were left in the choir. They were of about 1750 period, as handsome work of that kind as possibly could be found. There were three originally, and if they could have made another one and put either three or four into the nave, it would have improved the appearance of the cathedral enormously; it would have given a better light than at present and would have shown off the very fine specimens of metalwork of the time to which they belonged to advantage. Unfortunately that did not fall in with the wishes of some members of the Chapter, or whoever was responsible for it. They had lighted the cathedral in a fashion he could not say he liked at all. There was at one time a notion to restore what was called the Norman simplicity of the cathedral and they took out a lot of fifteenth-century windows. The notion of restoring the cathedral was absurd. The cathedral, like every other building, had been altered from time to time in the style of architecture belonging to the period, and at the best they could only imitate and it was not the real thing. If it was the best imitation it was a new window, and there were very bad imitations.

They knew that magnificent screen too, one of the noblest in the whole of England, so ruthlessly torn to pieces and scattered about in the castle, and many of the pipes of the organ, which were still in existence, had been allowed to be trodden underfoot and totally destroyed, although remonstrances were made time after time. The chandeliers were taken out of the cathedral, being not commensurate with the Norman simplicity of the building, and one was given to his church in the South Bailey, another was given to Shincliffe, and the third, which was of two tiers, to Ryton Church. The people of Ryton, after having theirs a few years, could not appreciate it, and sold it to a music-hall at Newcastle, and it was afterwards melted down and gone for ever. Some years ago he thought it would be a very great pity if these chandeliers could not be replaced in the cathedral, and asked Mr. Todd,

who was then vicar of Shincliffe, if he would give his back to the cathedral, and promised to do the same. He also spoke to the Dean, who said they would be glad to have them back, and so both were sent back to the cathedral, and there they were now. Then he made a search after the Ryton one and found it had been melted.

Proceeding to speak of the work going on in the castle, Dr. Greenwell said there seemed to be a great deal of good being done in strengthening the structure. But there was one thing not done about which he raised his voice over and over again, and that was in the housing of the students there. Sooner or later a fire would occur. They had one instance of a fire occurring lately in Selby Abbey. It was absolutely certain that some day or another one would occur within the castle, and nothing in the world could prevent the total destruction of the whole of that part of the staircase entirely, the black staircase, and most likely the great hall as well. A match dropping, a man putting his shirt to air in front of the fire, all kinds of causes might be imagined, and the whole place was wood—floors, ceilings, divisions of rooms. Pointing to Dr. Gee, master of University College, who was present, the President said banteringly, "If the castle is burned down there is the man on whom all the blame is." There was pressure, no doubt put on Dr. Gee, but he should be above pressure. They ought to do a thing quite irrespective of the pressure brought to bear, but he was afraid it would not be done.

The Selby Abbey fire was a deplorable event which had taken place during the year. It was not so seriously injured as was supposed. The nave was practically uninjured with the exception of the roof. The masonry had not been damaged at all, and to a large extent the stonework of the choir had not been so much damaged as it might have been, and in fact was expected. The great east window was quite intact, but, unfortunately, the very fine woodwork of the choir was entirely destroyed, and some portion of the very fine stonework which was part of the east end of the building, quite equal in style and delicacy of work and beauty of design to the well-known Percy shrine at Beverley. He was glad to say Selby Abbey, although it had lost a very considerable amount of things which were of interest, would not be a thing of the past at all, but would still be one of their finest buildings in the future as it had been in the past.

One of the most fearful things they had to do with was churchwardens, who had done a great deal of harm to the churches. They sometimes thought it was absolutely necessary to do something when nothing was required; why, he could not tell. But the people they deprecated were the organists, who were a hopeful people thinking of nothing but the organ. What was an organ? It was a very inferior thing to the human voice. The first thing that was considered in the churches was the developing of the human voice, and making it heard to the best advantage. The organist said "No," so he went and drowned the human voice, and you got great big organs put into churches—too large for any use that they could serve—and they got all kinds of destructive work in order to fit in these horrible things. He hoped the clergy present who had organs had small organs, which did not destroy the voice, and which were not put in at the expense of some of the destructive work that he had seen.

Mr. Hodges afterwards gave a brief outline of what had been going on at Hexham, and of the discovery of signs of an ancient church of the period A.D. 674 during the work of excavation at the abbey. The works connected with the rebuilding of the nave had thrown a flood of light upon what remained, and enabled a great chapter of entirely new matter to be written in connection with the great church which at the time it was built astonished all by its size and beauty. They knew now for the first time exactly where it stood and very nearly its actual size. It had a nave 100 feet long, which was a very large church indeed compared with other pre-Conquest churches.

A Bust and Tablet in memory of Charles Dickens have been set up on the site of Furnival's Inn, E.C., which has been amalgamated into the premises of the Prudential Assurance Company. A black granite tablet, designed by Mr. Waterhouse, upon the top of which is the bust of Dickens, has been placed just under the archway at the entrance to the inn. The tablet reads:—"Charles Dickens, novelist, born 1812, died 1870; lived for a time in Furnival's Inn close to this spot, and there wrote 'Pickwick' in the year 1836. This bust was modelled and presented by Percy Fitzgerald."

ARCHÆOLOGY IN READING.

THE annual reports from the Honorary Curators of the Museums and Art Galleries have been presented to the Town Council.

Mr. S. Slingsby Stallwood and Mr. George E. Fox reported, as hon. curators of the Silchester collection, that the season of 1905 was occupied in excavating at the western end of the grass field the two Insulæ V. and VI., portions of which had been examined in 1892. Buildings of the usual character were uncovered, but amongst them may be noted a dyer's workshop, some small houses and what was probably an inn; also what appeared to be a row of shops lining the street leading up to the Forum. The find of objects was somewhat less scanty than in previous years, but such pits and wells as were found afforded little to add to the collection. Of pottery, there was a certain quantity of the so-called Samian ware, but only in fragments. The glass was more interesting, as amongst the pieces turned up were fragments of a sapphire-blue mottled glass bowl like that found in 1895, and of a singular flanged bowl of clear glass. In metal, a short piece of fine gold chain. In clay or stone, the objects needing mention are a part of a figure of a Venus in pipe-clay, portions of trays of Kimmeridge shale, a fragment of a small white marble statuette; and, in ironstone, the forepart of a couchant lion and an altar, with wings projecting at the sides, intended for building into a wall, a base with delicate mouldings and part of a shaft of sandstone may also be noted. An extraordinary deposit of bones was found in Insula VI., consisting mostly of the lower jaws of oxen. The usual animal remains have been turned up, including, however, some of the cat, which are rare. From a tub well in Insula VI. came a stag's horn, pick, and parts of the skull of a child of twelve or fourteen years; but more curious was an interment found in Insula VI. In a room of house No. 1 of that insula a shallow grave dug in the floor close to the wall of the room was discovered. It contained a human skeleton placed on its left side in a crouched position. Such of the bones of the skeleton as could be preserved have been deposited in the collection, together with a photograph showing their condition as found. The photograph, taken by Mr. J. Challenor Smith, has been presented to the collection by that gentleman. Since the last report the plans of the public baths have been added to the collection. These, together with the plans of the baths formerly excavated, have been arranged in Screen III. in the Architectural Room.

Mr. O. A. Shrubsole, the hon. curator of the Geological and Prehistoric Department, reported that the most important acquisition by the Museum during the year had been seven British urns of the Bronze Age, which were obtained from a gravel pit at Sulham belonging to the Rev. H. B. Wilder. The urns were so fragile that it was necessary to specially excavate for them; and Mr. Wilder defrayed the cost of labour and allowed the Museum to retain the urns. In order to provide space for them a new turret-case had been ordered, and room would be found for this by putting the cases closer together.

The Rev. Alan Cheale reported concerning the Historic Archæology Department in September last a grant from the British School of Archæology in Egypt of various objects of interest, a donation from Mr. L. L. Treacher of iron spear-heads found in the Thames at Maidenhead, various loans from Mr. Eli Cauldwell, especially that of a small brass seal, apparently fourteenth century, with an inscription. This department is under much obligation to Mr. Cauldwell for continuous loans of objects. Considerable interest has been excited by the discovery of an upper stone of a quern with Romano-British pottery at the Prospect Park Brickworks. These relics have been presented to the Museum by the owner, Mr. Reginald Wells, who has also consented to excavations by the Berks Archæological Society to be carried out later in search of a Roman villa, of whose neighbourhood there seem to be some indications.

Mr. H. Dawson Barkas, the hon. curator of the art department, reported that the valuable collection of English pottery and porcelain lent by Mr. Cyril Butler, of Bourton House, Shrivenham, received in June 1903 was returned in May last. The two central cases in the art room, occupied by this collection, are now being used for exhibiting our own specimens of pottery and porcelain and the collection lent by Mr. J. G. Stanford, the latter being of educational value, showing the development in the art of English pottery since the sixteenth century. The two wall cases transferred from the Silchester collection are being used for exhibiting Oriental pottery, some Japanese objects

and additional English pottery. In the local collection of engravings and prints several interesting and notable additions have been made, viz.:—A fine coloured engraving of St. Lawrence Church, published in the early part of last century by Lamb (purchased); a coloured engraving of Luckley House, Sonning (purchased), completes our series of local views published by Timms in 1823; portraits of Miss Mitford (presented by Mr. George May); a portrait in colours of Dr. Cowan, of Reading (presented by Dr. Hurry), and an engraving of Dr. Thos. Ring, of Reading (presented by Mr. J. G. Stanford). In accordance with instructions received from Mrs. Mackenzie's solicitors, her collection of Raeburn portraits has been handed over to the authorities of the Brighton Art Gallery. This loan has been much appreciated and has attracted many visitors. At the present the gallery is occupied by the Stott Collection, which will remain until the middle of June, when arrangements have been made with the authorities of the Albert and Victoria Museum, South Kensington, for the loan of one of their series of water-colour paintings, illustrative of the rise and progress of the art of water-colour painting in England.

NATIONAL GALLERY OF SCOTLAND.

THE annual report relating to the National Gallery, School of Art, Museum of Antiquities, &c., for the year ending September 30, 1906, states that the admissions to the National Gallery during the year have been 66,881. The number of persons admitted to the Gallery since it was first opened in 1859 is 4,677,366. The following works of art have been added to the collection:—Antique marble bust of "Antonia Augusta," presented by Major-General D. M. Crichton Maitland; full-length oil portrait of Lady Shand, by Robert Herdman, R.S.A., presented by Lady Shand; picture in oil, entitled "Mischief," by G. F. Watts, R.A., presented by Mr. Watts's trustees; pen-and-ink drawing on panel, entitled "Seapiece, with Dutch Men-of-War," by William Van de Velde (the elder), presented by the Hon. Hew H. Dalrymple.

The number of individual students enrolled in the school during the year was 546, exactly the same number as in the previous year, and there was an increase of forty-two students in the total number enrolled in the various classes. The grant on attendances paid by the Scotch Education Department for the year ended July 31, 1905, was the largest ever received on account of the school, namely, 1,573*l.*, being an increase of 17*1*/₁₀ over that of the preceding year.

The admissions to the Scottish National Portrait Gallery and Museum of Antiquities during the year have been 17,355. The total number of persons admitted to the building since the opening of the temporary buildings in 1885 is 437,879. There have been added to the National Portrait Gallery by gift, or bequest, or loan—oil portrait of Flora Clift Stevenson, LL.D., educationist, by Alex. Roche, presented by Miss Stevenson's executor in fulfilment of her wish; and portrait of General Sir David Baird by Sir David Wilkie, presented by Major-General Sterling; crayon portrait of Lady Charlotte Bury, author and diarist, presented by the artist's executor; chalk drawing of Thomas Campbell, poet, by John Henning, deposited by trustees of the National Portrait Gallery, London. By purchase:—Oil portraits—Professor John Wilson, "Christopher North," by Sir John Watson Gordon; Sir John Macpherson, Bart., Governor-General of India, by Sir Joshua Reynolds. Water-colour portraits—Helen Faucit (Lady Martin), actress, by Kenneth Macleay; James Anderson, actor and dramatic author, by Daniel Maclise; crayon drawing of W. L. Leitch, water-colour painter, by E. Bundell Fox. Medallions—Thomas Walker, political reformer, by Tassie; John Henderson, Scottish actor, by Tassie.

The Council of the Society of Antiquaries have reported that the number of objects of antiquity added to the museum during the year has been 96 by donation and 44 by purchase; also 136 volumes of books have been added to the library by donation and 35 by purchase.

The admissions to Dunblane Cathedral for the period since it was opened to the public on April 1, 1893, to September 30, 1905, were 67,681; the admissions during the year were 4,548.

At the Anniversary Dinner of the Artists' General Benevolent Institution it was stated that 202 applicants were relieved during 1906 with the sum of 4,326*l.* in sums varying from 10*l.* to 100*l.*

NOTES AND COMMENTS.

It suggests the respect paid to law in England when, in spite of all the changes which have been made in the principles of sanitary science and the execution of works, that the statute 23 HENRY VIII., c. 5, should still be respected. The subject arose at a meeting of the Lincoln Court of Sewers last week, when a question was raised about the remuneration of a commissioner. The Act of HENRY VIII. provided that the commissioners should receive 4s. for every day "they shall take pain in the execution of these commissions of sewers, and one clerk by them to be assigned 2s. for every day, of the rates, tares, lots and wains that shall be assessed or lost by authority of the said commission, and be levied and paid by their discretions." Within the memory of living people no such reward was ever paid—in Lincoln, at least. Nor is there any record relating to it at an earlier time. HENRY VIII. was not the first king to recognise the importance of sewers for the safety and preservation of the realm of England, for in the time of HENRY VI. several commissions were sent into various parts of the country. The members held appointments during ten years, but the Chancellor could extend the time to fifteen years. The statute of HENRY VIII. treated the subject on a large scale, for it might be considered as dealing with the arterial drainage of the country, and applied to all works connected with sewers in those days. The oath which had to be taken by the commissioner is worth re-printing as a curiosity, and as suggesting how excellent work was accomplished in the sixteenth century. The phraseology is not unlike what is still employed in some legal documents:—"Ye shall swear that you to your cunning, wit and power, shall truly and indifferently (impartially) execute the authority to you given by this Commission of Sewers, without any favour, affection, corruption, dread, or malice to be borne to any manner of person or persons: and as the case shall require, ye shall consent and endeavour yourself for your part, to the best of your knowledge and power, to the making of such wholesome, just, equal, and indifferent laws and ordinances as shall be made and devised by the most discreet and indifferent of your fellows, being in Commission with you, for the redress, reformation and amendment of all and every such things as are contained and specified in the said Commission; and the same laws and ordinances, to your cunning, wit and power, cause to be put in execution, without favour, meed, dread, malice or affection, as God you help and all Saints."

FROM the report of the medical officer of health for the City of London, it appears that a large and increasing proportion of the new drains in the City are now constructed in iron with caulked lead joints. Iron, according to Dr. COLLINGRIDGE, has many advantages over earthenware, viz. the length of the pipes (9 feet against 2 feet) enabling a true alignment to be kept, the small number of joints, the fact that a defective joint can be caulked at once, saving delay, the greater resistance to subsidence and vibration, and the expedition with which the works can be carried out, the latter being an important item in large business premises, and indeed in any case. The disadvantages are the slightly increased cost of the material and the suggestion that the pipes are liable to corrosion; but if they are properly coated with Dr. ANGUS SMITH'S solution, this does not appear to be a real objection. On the whole, therefore, Dr. COLLINGRIDGE has concluded, iron pipes are preferable to earthenware ones, especially when the drain has to be laid beneath a building; also when a drain has to be driven through a mass of brickwork the iron pipe offers greater facilities for laying the drain, as the joints are so far apart and less cutting away is required in piercing the obstruction. When these advantages are more generally recognised it may be possible to require all drains to be laid in iron.

THE array of the names of supporters of the candidature of Mr. MAURICE B. ADAMS for membership of Council which appears in the last number of the *Journal of the R.I.B.A.* is evidence of the esteem in which he is held, and any member might well be proud of such testimony in his favour. The list may also be regarded as a protest against the inadvertence by which Mr. ADAMS was excluded on a recent occasion. Among the names are Royal Academicians, the President of the Royal Hibernian Academy, some knights, past and present members of Council; indeed, one of the latter it is known resigned in order to make room for Mr. ADAMS. Election in the case of Mr. ADAMS would be a recognition of services rendered to architects for more than a generation. In connection with the visits and excursions of the Architectural Association he was far the most active of auxiliaries. When Secretary of the Architectural Museum he was the principal upholder of the intentions of the original founders. He kept it from losing its character as a treasury of architectural examples, and finally by his tact he enabled the building and collections to become the property of the Architectural Association. Among the thirty candidates how many can point to more efforts for what may be called the general good, or, in other words, for the advancement of professional education? Recent events have demonstrated that a few sturdy, independent members would be an advantage on the Council, and Mr. ADAMS has shown that he will not sacrifice principle to please a majority. We hope therefore for the sake of the Institute as for his own that he will find supporters to place his name high on the voting return.

ILLUSTRATIONS.

CHURCH OF ST. MICHAEL, BECKTON.

THIS church is erected at the Beckton end of the parish of East Ham, for the Rev. J. HUBERT WARE, and is mainly to give church accommodation for the employees of the Beckton works of the Gas Light and Coke Co. The building is faced with Messrs. LAWRENCE & Co.'s T.L.B. bricks, and has stone dressings. The whole of the work was carried out by Messrs. JOHN BARKER & Co., LTD., Kensington, from designs by Mr. A. H. RYAN-TENISON, F.R.I.B.A., of 12 Little College Street, Westminster, S.W.

THE KNOLL, HOLLINGTON, SUSSEX.

HILL CREST, RYE, SUSSEX.

PUBLIC LIBRARY IN THE POTTERIES.

IT not infrequently happens in practice that the site available for a public library is a corner one at the junction of two roads. The design we illustrate is an example of how a public library in such a position may be effectively treated. The main entrance is well placed, whilst the design of the building expresses its functions as a library in a marked manner. The architects are Messrs. GROOME & BETTINGTON, of Hereford.

HOUSE IN CHESHIRE.

THIS charming country home has been built to accord with its surroundings; it seems to fit in with, and be part of, nature's scheme. This is, no doubt, largely due to the use of local materials and the use of half-timber work in the main gable, suggesting the old style known as "Cheshire Magpie" or Black and White. The lower portion is built of red brick, whilst the upper portion is covered with pebble dashing finished white, which contrasts well with the red-tiled roof and with the dark-toned half-timber work. The interior is a model of compact and convenient planning, and comfort has been studied in a marked degree. The architects are Messrs. GROOME & BETTINGTON, of Hereford, the sketch we reproduce being from the pen of Mr. GROOME.

CATHEDRAL SERIES.—CARLISLE: SOUTH AISLE, LOOKING WEST.

TWO BENEDICTINE MINSTERS.

A LECTURE on the cathedral churches of Gloucester and Norwich was given before the Society of Architects on Thursday evening, May 16, by Mr. E. W. Harvey, F.R.S.A., hon. member. The address was illustrated by about 20 lantern slides.

It was explained that each of the minsters is situated near a narrow but navigable river, in a quaint old city redolent with memories of the historic past, and each noteworthy as an example of Norman and Perpendicular architecture of great richness and beauty. In both cases the oldest portions of the existing fabrics, the choirs and transepts and their eastern chapels, were built during the last decade of the eleventh century, in the reign of William Rufus. In both the choirs retain the original Norman cores, but recased, veneered and remodelled in the perpendicular style, and each choir has been covered in by grand lierne vault of stone.

At Gloucester and at Norwich alike popular tradition, and also the guide books, ascribe to the founders the building of the cathedral naves; but in each case it is easy to observe that, although the foundations to plinth level probably date from the days of Rufus, all we see of the superstructure of either nave was in progress during the reign of Henry I.

The lecturer threw upon the lantern screen plans of Norwich and of Gloucester drawn to the same scale. They differ, he remarked, widely from those of most of our other great churches, and are alike in retaining their Norman outline less altered than does any other English fabric.

An initial distinction between the two plans which instantly arrests attention is the position of the cloisters. At Norwich this square enclosure follows the usual rule, as at Westminster, Winchester and Durham, and is placed on the south side of the nave, open to the sunshine and protected by the lofty walls of the nave and south transept from the north and east winds. At Gloucester, for some obscure reason, the cloisters were, as at Canterbury and Worcester, and other exceptional plans, built on the north side of the nave.

Turning now to the churches themselves, we notice that both Norwich and Gloucester are planned in a manner derived from that famous resort of pilgrims, the now ruined church of St. Martin at Tours, a plan usual in Normandy, but only adopted elsewhere in this country at Tewkesbury and Leominster, although traces of its influence are apparent in some features of Canterbury. Each of the cathedral plans shown on the screen has a continuous processional path round the choir, and the eastern end, instead of having the customary English square face, is semicircular at Gloucester and semioctagonal at Norwich. The transepts in either case are short, narrow and aisleless, and their thick walls, of the Norman days, are covered in by Perpendicular vaults. From the eastern face of each transept projects an apsidal chapel, while, alike at Norwich and at Gloucester, another pair of chapels juts out tangentially from the northern and south-eastern angles of the choir ambulatory, these tangential chapels being polygonal at Gloucester and segments of two overlapping circles at Norwich. The east end of the choir in each case formerly terminated in a short apsidal Norman chapel; but this was, in both instances, afterwards rebuilt on a greatly-enlarged scale and to a rectangular plan.

The interest of each church is greatly enhanced by the tracings in the Perpendicular style with which the original Norman masonry has been veneered. Frequent and disastrous fires resulted in both churches in the substitution of stone vaults for all the early timber roofs, while the urgent demands for better lighting, especially at the crossing in the presbytery and at the extreme west end, necessitated the enlargement and reconstruction of all the windows. The two cathedrals are nearly equal in area. That of Norwich covers 34,800 square feet, and ranks fourteenth in size among English minsters, being a little smaller than St. Albans, and a trifle larger than Worcester. Gloucester is less spacious; it stands nineteenth in dimensions, between Exeter and Exeter, with a superficial area of 30,600 square feet.

The proportions of the two minsters are very different. Norwich has an immensely long and narrow nave; at Gloucester the nave is comparatively short and broad. The same relative proportions are followed in the choirs, which, in either instance, is much more lofty and far better lighted than the nave. In each cathedral a portion of the roof vaulting is of unrivalled magnificence, but this splendour is

confined to the nave at Norwich and to the choir at Gloucester.

Norwich is stately, but painfully plain in outline and treatment; it has always lacked any projecting porch, and lost its chapter-house and lady chapel in the middle of the sixteenth century. Gloucester, on the other hand, is one of our most beautiful edifices, and is picturesquely broken in outline, while it possesses a unique interest in that it is the birthplace of the essentially English style known as Perpendicular.

Both fabrics contain little work of the thirteenth century; each has a scarcely altered Late Norman nave, vaulted during Henry III.'s reign at Gloucester, and in the days of Edward IV. at Norwich. Over the rough Norman masonry core of the choir a revetment of Perpendicular stonework has in each case been thrown, massive at Norwich, sumptuous at Gloucester, while the transepts, almost untouched Norman at Norwich, are encased in the later style at Gloucester.

It is well to emphasise the fact that both Gloucester and Norwich, like Canterbury, Winchester, Durham, Ely, St. Albans, Peterborough, Worcester, Chester and Rochester Cathedrals, and the abbeys of Westminster and Tewkesbury, were originally the churches attached to monasteries of the Benedictine order, served by monks who dwelt in the adjoining buildings, separated by the cloisters from the churches.

These monks were habited in loose black gowns, with broad sleeves and cowls; they dined together in a refectory built on the first floor of the monastery, beyond the side of the cloister further from the nave of the church; slept in cubicles in a long dormitory, which ran at right angles to this dining-hall and on the same level behind the east cloister walk. In the centre of this east walk a vestibule led to a rectangular chapter-house, parallel with the south transept, and in this house the business meetings of the community were held.

The monks spent most of their days in the cloister walks, writing and copying illuminated manuscripts in little wooden studies shut off in one of the stone walks; here, too, they taught the novices. They washed in the open lavatory, which we can still see at one angle of a walk adjoining the stone staircase to the refectory.

These cloisters at Norwich and at Gloucester are the most spacious and the most beautiful ever constructed in England.

One other peculiarity of a Benedictine church is well shown in each instance, as it is at Westminster: the choir stalls, instead of being confined to the presbytery, extend under the crossing into the structural nave, and the return seats are enclosed by a stone screen on which once stood the rood, now replaced in each case by an organ case of the Restoration era.

The present choir and transepts at Gloucester were begun by Abbot Serlo in 1088, only eight years before Bishop Herbert de Losinga commenced building similar portions of his church at Norwich; but whereas the East Anglian edifice was from the first intended for a cathedral, and occupied a new site, the see being transferred from a smaller town, at Gloucester the story of St. Peter's Abbey goes back four centuries earlier, to the joint monastery for monks and nuns founded in 681 by King Osric; but it remained only an abbey until 1540, when Henry VIII., having disbanded the monks, converted it into the cathedral church of one of his new bishoprics.

One other point of similarity in the history of the two cathedrals is that both suffered grievously during the Commonwealth, the desecration of Norwich being pathetically told by the saintly Joseph Hall, then bishop, in his "Hard Measure."

The author proceeded to show and give running commentaries on parallel features in the two cathedrals, alternately taking up the thread of either story, as a novelist depicts the woes and adventures of hero and heroine.

A general view of Gloucester from the Severn side, showing the magnificent cathedral tower as the dominating feature of the landscape, was followed by two illustrations of the spire and choir of Norwich as seen across the Wensum at Pull's Ferry, with the fourteenth-century low water-gate of the monastery in the foreground.

The most picturesque aspect of Norwich, that over Life's Green from E.S.E., gave the opportunity for a few words on the construction of the present stone spire, which had three predecessors of timber, each in turn struck by lightning and destroyed, and on the works of vaulting in

stone, all due to fires, carried out successively over the nave, the choir and transepts, by Bishops Lyhart, Goldwell and Nix.

A bird's-eye view of Gloucester from a similar standpoint followed, and it was evident how greatly this minster excels its East Anglian sister in dignity of mass, variety of contour and charm of detail. In the foreground at Gloucester is the grand lady chapel, the finest in England, made cruciform by the projection of little two-storeyed transepts to north and south. From this aspect the eye is led up from the flat-leaded roof of the south choir aisle to the great choir clerestory and the broad and lofty transept, and so upward to the most majestic tower in England, rising in two grand stages to a richly-turreted and battlemented summit of open masonry, delicate as petrified lace, the whole mass being admirable in its balance and proportions.

Following these general views, fresh plans of Norwich and of Gloucester were shown in succession, the salient constructional developments, their builders and the approximate dates being rapidly sketched.

The all-important part which Gloucester played in the history of the architectural development of the Later English Gothic was dilated upon. While in France the curvilinear work of the fourteenth century gradually changed into a florid type of Flamboyant, its vigour losing itself and running to seed in wiry, flamelike curves, here in England, thanks to the lead given at Gloucester, the style gradually became more formal, more dignified and tame, more clearly subdued by the constraint of vertical and horizontal lines. Here, in the south transept of Gloucester, the outlay being met by the offerings of pilgrims to the shrine of that meanest of all monarchical martyrs, Edward II., we witness the birth of the style nicknamed Perpendicular. Here we trace its evolution in the form of a veil of appliqué work in masonry added successively to the wall-surfaces of the choir and the north transept of this great mitred abbey church. The inexplicable fact, the unsolved chronological problem, was that here the new fashion lay dormant for more than a generation, like a bulb during a chilly May, and it was not until half a century later that it was taken up at Edington and at Winchester, and then spread in a sudden blaze of splendour all over England.

Nearer views of the east end of Norwich were then shown, the second one exhibiting the beautiful thirteenth-century arches formerly leading from the presbytery into Bishop Suffield's lady chapel, destroyed in 1573 by Dean Gardiner. The flying buttresses supporting the great clerestory windows of Bishop Percy, and Bishop Goldwell's stone vault to the apse itself rest on lofty piers, the outward thrust whereof is checked by large statues of the Disciples. The utilisation of the Twelve Apostles as makeweights was a thing to be deprecated. Another aspect of Norwich not often seen is from the north-east, the lofty choir and spire forming a background to a view across the palace gardens, with Bishop Reynolds's private chapel and the ivy-clad ruins of the guest-hall immediately to the right.

Bird's-eye perspectives from adjoining church towers of the west fronts of the two cathedrals, that of Gloucester from the truncated spire of St. Nicholas, that of Norwich from St. George's steeple, Tombland, showed that the poorest aspect in both minsters is that from the west. The west end of Norwich fails to attract from inanition and want of go, and also from the foolish restoration of between thirty and forty years since, by which the picturesque Elizabethan cupolas, familiar to the lecturer from childhood, and to all from Garland's and Britton's Views, were replaced by "Early English" pinnacles, and modern "Norman" was substituted for fragments of fifteenth-century masonry. The more recent removal by some timid surveyor of the pair of pinnacles flanking the gable had only made the nakedness of the front more evident. The west front of Gloucester is more ambitious, and is part of Abbot Morwent's reconstruction of the two western bays of the nave in 1430, but architecturally it is a dismal failure. It is ruined as a composition by continuous bands of transoms across the upper part of the great window, and by the harsh lines of the flat gable which show behind the pierced parapet. The open buttresses of the chief mullions, just recently crowned with little figures of saints, of insufficient scale for their position, are remarkable rather than pleasing, and the only redeeming features of the Gloucester façade are the square angle turrets, which consort well with the pinnacles of the central tower. To the left is the beautiful, if bepatched, thirteenth-century front of the Deanery, formerly the

Abbot's Lodging, in which many royal and other visits of high degree have been entertained.

The imposing south side of Gloucester nave and bold south porch, the most satisfactory feature of Morwent's rebuilding works, were next shown, the likeness of the porch to the similar and slightly earlier feature at Chillenden at Canterbury being pointed out. In both cases the statues destroyed by Puritans have been replaced by indifferent modern figures, Redfern being responsible for those at Gloucester, any one of which, it was suggested, would have needed a king's command to secure admission to the current Academy exhibition.

A photograph of the pierced buttresses, the beautiful Decorated windows and Norman walling of the south nave aisle at Gloucester, led to the narration of how, owing to the weight of the stone vault thrown over the nave by the monks under Abbot Henry Foliot in 1242, the south wall steadily bulged outwards, until in 1318 the then Abbot, Thokey, realised that active measures must be taken to obviate collapse of the structure. The present open buttresses were built up against the Norman ones, the stone groining was taken off the aisle and replaced by a pointed vault carried by quadripartite ribs, and for the semicircular windows were substituted new ones with pointed heads and flowing tracery, the whole of the fenestration, within and without, and the vaulting ribs being covered with a profusion of the ball-flower ornament just at that time so popular in the West of England.

Reverting to Norwich, the gatehouse built by Thomas Erpingham in 1420, was followed by a glance at the nave and spire from the south-west, and the story was told of the riots, fire, desecration and bloodshed of 1222 due to the quarrel as to Tombland fair tolls between the monks and citizens, fanned by the aggressive measures adopted by "that accursed prior, William de Brumham." The beautiful but much-restored gatehouse of St. Etheldreda, built by the monks in expiation of their share in the disturbances, was next viewed and the scene shifted back to Gloucester, where the south and north sides of the choir aisles were in turn seen. It was pointed out that, unlike Norwich, Gloucester has under the choir and its chapels an Early Norman crypt, exactly the same in area as the groined plan, and on the first floor again, over the vaulted north and south choir ambulatories, on either side of the choir, is a spacious and lofty triforium, also vaulted in stone, approached by good stone staircases and connected across the east window by the so-called "Whispering Gallery," a corridor 3 feet wide and 6 feet in height. Externally this passage-way forms a marked feature from the south-east and north-east, as it is carried in front of the chapels forming the eastern terminations of the choir aisles; in its construction the fourteenth-century builders reused Norman work in masonry, their economical habits proving a snare and a stumbling-block to ill-read successors to the members of the Pickwick Club. At the south-east angle the lecturer pointed out that there was in view a study in the development of Mediaeval fenestration—Norman, Early English, Early Decorated, showing ball-flower ornament, and finally Late Perpendicular, all comprised at one glance.

Passing still further north in the circuit of Gloucester the audience stood in Pitt Street, looking on the gateway arcade of the infirmary, cleansed by Sir Gilbert Sturges seven-and-thirty years ago of the picturesque sixteenth-century bay windows and walling with which they had been filled in, and left as perfect, as neat and as unromantic as a cemetery mason could have desired. It was curious to note that at six Benedictine cathedral monasteries, this of Gloucester and those of Norwich, Canterbury, Winchester, Ely and Peterborough, only an arcade remains of the infirmary in which the monks were nursed after blood-letting and during sickness and throughout extreme old age. Here the walling was of very Early Decorated character, with grouped shafts and narrow bands of continuous foliage in the capitals and wide moulded arches. Through the openings are gained finely framed views of Abbot Seabrooke's superb central tower.

Once more the magic carpet was invoked to convey the spectators back to Norwich, where the long line of the flat-leaded nave roof was seen rising beyond the ruins of the refectory, while to the right rose the bold south transept with the tower and spire immediately behind. Next came a bird's-eye view across the cloister garth towards the spire at the north-east angle, and the author raised the question whether the cloister garth of Norwich or Gloucester is the most beautiful in England. Certainly they have no rival elsewhere, either in spaciousness, in picturesque

in serenity. In both cases the cloisters replaced earlier ones of timber on stone plinths, probably destroyed by fire, and were several generations in course of construction. Norwich was by far the slowest in reconstruction, for whereas Gloucester cloisters were in progress during sixty years, from 1352 until 1412, during the reign of four abbots, those at Norwich were a-building during 133 years, having been begun half a century earlier in 1297, and not being finished till twelve years after Gloucester in 1430, while even bishops in turn wore the mitre, including such names as Walpole, Salmon, Percy, Spenser, Courtenay and Alnwick. During all this long period the original plan and dimensions of the bays of each walk were maintained, and it is easy to trace a gradual progression in the fashion of the fenestration from east to south by west to the north—that next the cathedral—and the last to be reconstructed. The audience were asked to glance in passing upon the bewildering piling-up of windows in the lofty nave, with two sets of triforia and two of clerestories rising over each other tier upon tier—all tears, like Niobe, it was suggested in an aside—broken into here and there by later efforts to secure better lighting for the interior.

The comparison with the complicated fenestration of Norwich elucidated the simple plan of Gloucester. Here the effect of a peep across the cloisters to south-east suffered from the uniformity of the tracery, as well as from the lower and simpler character of the walling behind; but the tower which here replaced the spire of the East Anglian minster seemed assuredly a grander finish to the *coup d'œil*. The garth of Gloucester was, for centuries after the Reformation, and even when the lecturer first visited it, a howling wilderness, and was traditionally said to have been the chicken garden of the monks, a legend which the author believed. Thirty years ago it was laid out as the amenity garden, and the public had now a grievance in that its beauties could only be inspected from two or three distant viewpoints, as the tracery of the cloister walks was wedged with the obscure glazing facetiously known as cathedral glass, with here and there stained glass as hideous as it was misplaced. Another modern grievance was that the lecturer's visit this spring he found that the trees and shrubs planted about thirty years ago have now grown luxuriously that it is impracticable, even before the trees are burst, to obtain a clear and unobstructed view across the garth. A fifteenth-century gargoyle at the north-east angle of the cloisters represents a bearded man grasping a rainwater pipe, suggesting to the fanciful the Angel Peace bearing away the cannon that has devastated so many homes. Some detailed views of the cloister fenestration were followed by interior views in the walks. At Norwich a drawing by Ethel Buckingham was reproduced, picking up the east walk towards the well-known prior's doorway, which was directly afterwards shown at close quarters from a photograph. At Gloucester the illustrations included the caryls in the south walk, where the monks studied in seclusion in little recesses like sentinels' boxes; and the famous lavatorium and its cistern, the finest of all those of monastic times remaining to our days. The much more modest fifteenth-century lavatory at the north-east angle of Norwich cloisters followed, and a visit was paid to the chapter-house at Gloucester, the best fabric of its class, and part of the original foundation by Abbot Serlo. The eastern bay is obviously new. As a matter of fact, it was pulled down and rebuilt in 1460 by Abbot Richard Hanley, to whom we also owe the present lady chapel. Over the Norman bays is a heavy barrel-vault, carried by ribs rising from recessed columns, and along the walls is the usual Norman arcading, all in marble, resting on a continuous stone bench, whereon the monks sat in chapter. The flooring is so low below this level that the monks of short stature must have suffered grave discomfort during lengthened sittings, and curiously enough the stone bench along the inner side of the cloister walks is just as inconveniently low, to the detriment of tall men. On the north and south wall spaces of the chapter-house some fifteenth-century black and white painting has recently been renewed in startling and unusually vividness.

Having completed a perambulation of the cathedrals, the lecturer devoted the second portion of his address to the interiors. Entering Norwich by the west door, he remarked that the nave was one of the longest and the most impressive in England, its effect being only surpassed by the totally diverse nave of Westminster Abbey. Of sixteen narrow but lofty bays, with a wide triforium and clerestory on either side resting on stone vaulted aisles, it

shows massive treatment of fully developed Norman of the days of Henry I. The huge piers gain some of their effect, as do those in the naves of Ely and Peterborough, from the fact that the inner faces are alternately semicircular and divided into a triplet of shafts. Over the openings to the aisles we glance into the cavernous depth of the triforium on our left, of equal span and height with the arcade below, resembling in spaciousness those of Ely, Peterborough, St. Albans and Southwell, but infinitely finer in treatment than any of these. When a lad the lecturer used to hear the verger boast that a waggon and four horses could be driven round the triforium, so wide and well paved is it, and he then wondered how they got the team up to its floor, and what was found there worthy the cartage. Glancing up to the shallow clerestory, the merest tyro in architectural history realised that what at first seemed a harmonious composition is of two widely separated periods. On the walls built between 1110 and 1120 is poised a magnificent groined lierne vault, erected in 1465-70 by order of Bishop Walter Lyhart. For this stone roof, the finest in the country, we are indebted to the disastrous fire of 1463, when the wooden spire was struck by lightning. The vault is separated by a wide gulf from that by Beaufort over Winchester nave, and is immeasurably superior to Chillenden's roof over the nave of Canterbury; it is noble in conception and execution, refined and yet lavish in detail.

Turning now to Gloucester, we open the west portal, and ask if two contemporary naves could be more unlike than those of Norwich and of Gloucester? They were both in progress at the same time; but the broad piers and great triforia of Norwich are here replaced by lofty cylinders of masonry, rising clear from the paving to a height of over 30 feet, with plain capitals suggesting those of the Doric order, and carrying an arcade, with a narrow but rich double zigzag ornament. Above this tall arcade is a meagre Late Norman triforium and clerestory, and over these again was thrown in 1242 a quadripartite vault of the Chichester type. The monks themselves, under Abbot Henry Foliot, we are told by Froucester, laboured at the roof, considering they could do it better than skilled but less pious workmen. The result does more credit to their courage than to their architectonic knowledge or technical skill—indeed, their revaulting is almost revolting in its effect. The need for the vault was urgent because the flat wooden ceiling, which probably resembled those of Peterborough, Waltham and St. Albans, had been consumed in one of the numerous fires with which Gloucester Abbey was afflicted.

Glancing again at the chimney-like columns, we recollect that they are but shams; instead of being solid, they are mere casings of masonry around masses of loose concrete and rubble. This was their salvation a century and a half ago, when the ignorant and conceited Kent, self-styled an architect, actually proposed to flute them, so as to reduce their girth, but was dissuaded on learning the real construction.

When were these cylinders built? And where was found their model?

They subvert the ordinary opinion that the nave, like the choir, is the work of Rufus's friend, Abbot Serlo, for no such Doric capitals, no such voussoirs to the arcade, can be paralleled elsewhere of that period. The treatment of the masonry is absolutely diverse from that of the core embedded in the walls and arcades of the choir, and it is evident that at the time of the dedication of Serlo's church in 1150 only the eastern limb, the transepts and a bay or so of the nave existed. Similar columns and abaci to these exist only on the Western Marches, at Tewkesbury, Malvern and Pershore.

Here a slide of the interior of Tewkesbury Abbey church, looking east, was cast on the screen, and it was apparent that while there is a great resemblance to Gloucester, the soffits of the arcade and the treatment of the aisle are plainer. This nave, which was revaulted in the fifteenth century, was consecrated in 1121. Somewhat similar caps and abaci were to be seen in the nave of Southwell, built in 1120. Two other views showed the north nave arcades of Gloucester and Tewkesbury looking in the same direction, east, and seemed to the author to establish the point that they were contemporary and influenced each other. At Tewkesbury the same details were visible as at Gloucester, but executed in a ruder and plainer fashion, and with less available funds.

In the nave of Norwich the feature that awakens most curiosity in the minds of laymen is the pair of enormous

twisted, or rather channelled, columns on either side at the second bay west of the organ screen. A like but less noticeable pair is embedded in the eastern wall of the choir-screen. Each pillar is of great girth, and is ornamented with spiral channelling cut deeply into the surface. Somewhat similar fluted columns are to be seen in Ralph Flambard's nave at Durham, built between 1100 and 1129, and smaller ones at Waltham Abbey and Lindisfarne, and stamp the date of the nave in the days of Henry I. as effectually as do the lofty shafts at Gloucester. On the south side of Norwich nave the two aisle bays west of the channelled pillar were converted into a chantry by Bishop Nix, 1536, who invested the piers and soffit of the Norman arcade with stonework of Tudor character, and set up an altar, of which only the reredos, despoiled of its statues, remains. The fan tracery above each bay is nearly two centuries later than the similar work in Gloucester cloisters. To light his chantry the better Nix cut away the twelfth-century arcading below the triforium in the two bays of the south wall of the nave opposite and inserted huge windows of his own day. Nix, indeed, comes down in history as an infamous, simoniacal and persecuting prelate; but contemporary historians probably painted his character the blacker because he had the audacity to side with the Pope against that godly defender of the faith, Henry VIII.

Successive illustrations of the south nave aisles of Norwich and Gloucester were exhibited, the former tame and ordinary, the latter showing Abbot Thokey's daring and successful reconstruction of the twelfth-century vault. Crossing the nave of Gloucester by the screen, the north aisle, which retains its Norman vault, was seen in either direction, from east and from west, and on its north wall were successively examined in detail Abbot Froucester's grand processional doorway into the west cloister walk; John Flaxman's dignified monument to Mrs. Sarah Morley, attended in her ascent heavenward by a well-grouped bevy of angels, and the quaint Jacobean tomb to Alderman Thomas Machen, his portly spouse, and their symmetrically disposed dozen kneeling sons and daughters in a bas-relief, the whole an excellent illustration of the costumes of 1615.

Returning to Norwich, the nave was seen looking westwards, and it was noted that, unlike Gloucester, it retains its Late Norman work throughout. The whole space over the western doorway of 1120 (and a stone beam of the fourteenth century), is filled by a huge nine-light Perpendicular window of the Westminster Hall pattern. Erected by Bishop Alnwick in 1436, it was filled by Hedgeland nearly sixty years ago with the strangest medley of stained glass ever passed by a complaisant memorial committee. In one hotchpotch are jumbled together feeble copies of half a dozen paintings by men as diverse as Raphael, Le Brun and Benjamin West. This travesty on stained glass serves as a memorial of good Bishop Edward Stanley, the ornithologist and evangelical preacher, father of the more distinguished Dean of Westminster.

A similar pair of illustrations of the nave of Gloucester, looking west, showed the results of Abbot Morwent's reconstruction of the two western bays, c. 1425-30. The work is of a poverty-stricken type of Perpendicular, and fitly matches with Foliot's home-made vault over the eastern portion of the nave. The nine-light west window is uncommonly like that of Norwich, and like it is filled with stained glass to a mid-Victorian bishop, Dr. Monk. It is by Wailes, is seven years later than Norwich, and does not offend the canons of good taste in glass so outrageously. The rector of Dursley, the Rev. Canon Bartleet, has a tale to tell of this window. Under the canon's guidance some old dames from his parish visited Gloucester. In the cloisters Mr. Bartleet explained to the members of his mothers' meeting how the Benedictine monks once lived there, studied in the caryls, washed at the lavatory, dined in the refectory and slept in the dormitory, or betimes, perchance, in the church. At the close of the inspection one old lady lingered long, and cordially shaking her rector's hand, told him how she appreciated all he had told them about the monks more than the other villagers, "Because you see, sir, my old mother washed for them monks." The canon was taken aback, because, although his informant's mother might have suffered ablutions oft and sore vicariously for the Benedictines, they had been disbanded for three and a half centuries, and the daughter had neither the reputation nor appearance of being a tridentarian. Further questioning showed that the "monks" for whom the old dame's mother washed comprised the family of the first Bishop of Gloucester and Bristol, to whose memory this window was erected.

The glory of Norwich is the lierne vaulting over the nave. The intersections of the moulded ribs are covered by stone bosses, 328 in number, carved in rather coarse and archaic fashion with incidents from the Old and New Testaments, with here and there Bishop Walter Lyham, rebuking a hart lying in the water; they are richly coloured and gilded. Several examples of these bosses were shown, including representations of the Magi, the Last Supper, Peter Released from Prison, and Satan Securing the Son of Herod, the last scene depicted in the customary Mediaeval manner as a befurred, horned and tailed satyr drawing a small naked figure from between the bearded lips of a dying and bedridden king.

Once more the glories of Gloucester held the field, the audience were invited to inspect one of the most brilliantly lighted and most stately choirs in England. Looking eastward from the entrance under the organ screen, all stone panelling seen to right and left beyond the stalls was observed to be but skin-deep ornamentation, a casing of a core of Norman masonry, glimpses of the inner fabric, the oldest part of the minster above ground, being revealed in the round arches of ground floor and triforium. These wide semicircular arches two storeys in height were draped but not hidden by a veil of delicate masonry in open mullions and transoms forming a panelling to each bay. Elegance, harmony and grace characterise the encasement executed by Abbot Staunton and his successor Horton during the fifty years' reign of Edward III., an expenditure easily defrayed by the gifts of pilgrims at the tomb of the king's father. The vaulting overhead, although not up to the Norwich standard, is light and effective, but attention held by the glowing illumination provided by the enormous east window, the largest in Great Britain. Its width is 38 feet is, indeed, a little greater than that of the choir itself, for in order to enhance this wealth of glass the north and south walls of the last bay of arcading in the presbytery were taken down and rebuilt so as to slope outwards at the east end towards the aisles, the inner face of the vault being thus slightly concave. It still contains much of its original stained glass; of the forty-nine full-length figures thirty-seven are absolutely genuinely attired in the costume of the early days of Edward III.; of the eighteen armorial shields thirteen bear the identical coats of arms worn by those who fought on the field of Cressy. Thus records of costume, heraldry, treatment of glazing are independently witnessed that the window was completed between 1330 and 1350. Unfortunately, the colour of the glass is to the lecturer not attractive, being largely dingy white and yellowish-green. If one goes outside he will find that the tracery heads and cusps so prominent in the upper portion of the window are only applied on the inner soffits, and are not repeated on the external surface; the same economy in cusping is evident in the great west window of the nave.

The stalls to the left or north are the oldest, the work of Abbot Staunton; those to the south were constructed by the next abbot, Horton. In the foreground, in front of Scott's reredos, the oaken effigy and altar tomb of Robert Curthose have recently been replaced on the original site.

As we stand here a dissolving view passes before the mental eye. All the appliqué work dissolves from the walls, and squat piers and round arches equally divide the space to right and left, and before us is a similar low arcade, through which we see the light of a round-headed eastern window in the short apse and the chapel beyond, as in St. Bartholomew's, Smithfield, and St. John's in the White Tower. The roof-vaulting is lowered, barrel shaped, and plastered and painted; rude oak benches and a stone benching next the walls replace all the fittings, and to the left a clumsy wooden pulpit. It is August, 1100, and even the massive-walled fragment of a church is well lighted. In the choir itself are seated the hot-tempered red-haired king and his nobles, clad in short-sleeved tunics, and over them full-lined cloaks, with pointed shoes and gloves; nearby are armed huntsmen, while massed in the transept limbs of the shire abbey church are the three-score monks from the adjoining monastery of St. Peter and others from neighbouring houses and not a few secular clergy, with the Abbot Serlo, his prior, treasurer and other officials. The pulpit before us is occupied by a stranger, Abbot Fulda of Shrewsbury, who preaches a scathing sermon in which he predicts the end of a covetous, unjust and pleasure-loving monarch in a district far to the south-east, where two other members of the blood-royal have already met violent deaths. The prophecy is so pointed and unmistakable that courtiers and monks alike wince as they look upon the haughty king's countenance. Afterwards Abbot Serlo, who has a genuine

affection for his rough monarch, begs William to take warning and, at any rate, not proceed on his hunting expedition. How the king angrily brushes aside his mentor, how he rides off to the New Forest, where Walter Tyrrel's bow, drawn at a venture, lays him low, and how his corpse is buried under Winchester Cathedral tower, which forthwith collapses—all these we recall as schoolboys' history as the vision fades.

The unsatisfactory and inadequate reredos at Gloucester, designed by Sir Gilbert Scott and executed by Redfern five-and-thirty years ago and the Early sixteenth-century four-stalled sedilia, elaborate but stiff in treatment, were seen and a return was made to Norwich. From Lyhart's organ screen is a bird's-eye view to east-north-east over the choir, presbytery and apse, with a glance at the unaltered work of the days of Rufus in the north transept. We are still west of the crossing, and beyond the massive clustered piers carrying the tower and spire we see the veneering applied by Bishop Goldwell to the lower arcade of the Norman presbytery. To Goldwell we also owe the heavy ierne vault overhead. The apse itself is Norman, but the openings into the lady chapel are Early English, while the clerestory above is the work of Bishop Percy in the middle of the fifteenth century. A clamber up the narrow and ill-lighted tower staircase brings us to the lantern stage, looking on the Norman arcading and circular portholes of the passage round the interior of the steeple. From this point steps and shaky ladders took the lecturer to the topmost lucerne light in the spire, where beyond and above the closely massed houses and churches of the old city stretches on every side a broad tableland of sparsely inhabited country, wide segments of grey sea rimming the horizon at two points to east and north-north-west; but of this view no slides were obtainable. Descending again to the floor level we look up into the central tower, revealing a curious foreshortened effect of arcading and of the wooden panelling of the belfry floor, 120 feet above the legs of the camera. The next illustration was of the beautiful Flamboyant clerestory windows in the apse, executed about 1360 for the youthful Bishop Percy, who, appointed to the see an inexperienced priest of two-and-twenty, died at the early age of thirty-five. The roof then was of timber, and was replaced a century and a quarter later by the present stone vault, in which Goldwell has perpetuated his memory by arranging that very boss should represent a shallow gilded bowl as a rebus on his name. The next view is taken from the edge of the central triforium bay in this apse, looking westward and upward along the whole length of Lyhart's nave vault to the west window. On the nearer and eastern lower arch can be traced the outlines of the earlier timber roof over the choir, which was waggon-shaped and much lower than the present vault. Below the wide triforia on either side can be seen Goldwell's Perpendicularisation of the presbytery arcade. The guide books dilate on the "wonderful engineering ingenuity Goldwell displayed in supporting the upper walls" while he removed and rebuilt the arcade. The author, therefore, examined the work closely on his last visit to Norwich, and found that all the prelate's ingenuity consisted in scraping the Norman wall to a depth of 2 inches to 2½ inches, and applying to it a veneer of thin slabs of richly-carved stone. Even so unreflex and original a writer as Mr. Francis Bond speaks of this as "one of those marvellous pieces of engineering which the Mediæval architects were so fond of," but the lecturer could see nothing beyond the powers of a Max Ende to devise or a Brunel to execute. Below to the left, in a bay of the south arcade, is Goldwell's tomb, built in his lifetime, and the only Mediæval monument in Norwich showing an effigy. The figure is, as Bloxham pointed out a generation since, a unique example of a pre-Reformation bishop wearing a processional cope. The mantling and helm on the cornice are exceptionally vigorous, and dwarf the coat of arms below.

Returning to Gloucester, a nearly contemporary tomb effigy is seen in the choir—that erected by the last Abbot Parker to house the dust of King Osric, by whom the abbey was founded in 681. The tomb was long regarded as a mere cenotaph; but twenty years ago it was opened by the present scholarly Dean, Dr. Spence Jones, when it proved to contain human bones in a leaden coffin. Parker was no stickler for historical exactitude. The seventh-century monarch represented, with a charming indifference to anachronism, in Tudor regal costume, crown, tunic, mantle, collar and shoes, the latter resting on a lion of England. On his east is the model of a sixteenth-century church. The treatment of the tomb and its cornice and bratticing is far

superior to that of Goldwell at Norwich some twenty years earlier. Next was seen the thirteenth-century oak figure of Robert Curthose, son of William the Conqueror, which, with the fourteenth-century altar tomb on which it rests, has lately been brought from the Boteler Chapel to a space immediately in front of the altar in the choir. During the Commonwealth troubles this effigy was broken in pieces by the soldiers, but the fragments were preserved by Sir Humphrey Tracey and replaced in the north-east chapel soon after the restoration of Charles II. The sculptor was no genius, and evidently found the carving of the hands beyond his skill; they are more like the flippers of a seal. Passing through a wide and richly-groined ante-chamber, we find ourselves in the largest, loftiest, widest and most splendid lady chapel in England. It was built at the very end of the fifteenth century—between 1477 and 1499—by Abbots Hanley and Farley. The richly-groined roof is of the same type as that over the choir, and the nine-light east window contains a medley of ancient glass. Before the beautiful reredos are the altar rails put up by Archbishop Laud when dean. Along the panelled walls, which above the dado level are almost unbroken window surfaces, are several interesting Jacobean and Georgian monuments. Turning back, we see that over the vestibule is a small ante-chapel, separated by an open screen and approached from the triforia, right and left, by the famous Whispering Gallery. We retrace our steps to the altar steps of the choir, and looking westward see a fine six-light window in the west wall, the greater height of the choir over the nave allowing this to be pierced so as to derive light through the tower. This western window, with which the vergers of Gloucester love to astonish non-architectural visitors, suffered in the very last outburst of Puritanical iconoclasm in England—in 1689, when the Mediæval stained glass it contained was smashed, on the ground that it represented the Trinity.

A view of Norwich choir from a like standpoint shows the much tamer character of the architecture. It displays also the new bishop's throne recently substituted for an awful example of an "eighteenth-century Gothic" throne, now justly relegated to the Consistory Court. The choir-stalls both at Norwich and Gloucester each provide sixty-two seats, the number of the inmates in the monasteries. In both cathedrals there are good examples of fifteenth-century carving in oak. Two misereres were shown from Norwich—a lion biting a knight, to whose rescue a maid comes and attacks the animal from behind, and the familiar story of the farmer's wife chasing the fox which has stolen her fat goose, a collie joining in the pursuit, while a pig takes advantage of the occasion and helps itself from an overturned pot. The examples selected of Gloucester misereres, which are carved the reverse way so as to be viewed from the ledge and not from the back as at Norwich and elsewhere, were three—a mermaid with her outstretched arms supporting a pair of dolphins, Samson being shorn of his locks by Delilah, and the ascent into heaven on eagles' wings of Alexander the King.

Another visit was paid to Gloucester to inspect the details of Thokey's early fourteenth-century work in the south transept and the adjoining aisle of the nave, and a bird's-eye view was taken across the transepts to the north, the suspended vaulting across the tower arches to north and south being shown in detail and demonstrated to have no structural or mechanical value. The very early character of the Perpendicular work in the south transept, the rounded sections of the vaulting ribs and the absence of bosses at the intersections were pointed out. In the north transept it was seen that the treatment is more advanced. A somewhat similar view across the transepts at Norwich from south to north, also taken at the triforium level, revealed plain and scarcely altered late eleventh-century masonry, although the vaulting is the latest work of the kind in the cathedral, having been added by Bishop Nix about 1530. Two monuments of nineteenth-century Norwich prelates in the transepts were seen in detail—the seated marble figure of Dr. Bathurst, a dull, dignified bishop who died in the year of Queen Victoria's accession, and is represented by the latest and one of the poorest of Chantrey's works. This is placed against the east wall of the south transept, while in the centre of the north transept is James Forsyth's altar tomb to the last bishop, Dr. Pelham, in which the contrast between the white marble effigy and the streaky alabaster tomb is somewhat too vivid. Returning again to the north transept of Gloucester, the variety and superior beauty and scenic effect of this cathedral were at once apparent, the

views selected for illustration including a peep to north-west across the nave, a glance into the apsidal chapel of St. Paul, with its richly-canopied Perpendicular reredos and Late windows set in Norman walling; the thirteenth-century reliquary, described in a guide book of eighty years since as the "punishment cells for monks," and at a later period regarded as a lavatorium; and the curious little fourteenth-century pilgrims' lectern at the entrance to the north ambulatory. In the ambulatory itself the chief object of interest is the elaborate monument of Edward II., with its ornate tabernaclework, set off by contrast with the dwarf Norman pier on either side. The profile of the face was shown to have a great likeness to the effigy by William Torel of the murdered king's grandfather, Henry III., to that of his son, Edward III., both in the Confessor's Chapel at Westminster Abbey, to that of his grandson, Edward the Black Prince, at Canterbury, and to those of his great grandsons, Richard II., shown by carved figure and Haxey's painting at Westminster, and Henry IV. at Canterbury. Crossing the choir of Gloucester to the south ambulatory, the great and unique cope chest, shaped like a legless grand piano, was seen; a glance given into St. Philip's chapel, and the stone staircase was ascended to view the spacious and well paved and light triforia, with their peculiar flying buttresses employed within as vaulting ribs.

Reverting again to Norwich, the choir ambulatories were visited. A charming and unparalleled feature is the bridge crossing the north aisle, formerly leading to a reliquary chapel long since destroyed. A circular turret contains the staircase by which the priest gained access to the bridge, from which he hung the Eastern or Sepulchre light. The garishly-decorated vesical Jesus chapel projecting to the north-east having been visited, the choir was crossed to the south ambulatory, ridicule being poured on the tradition beloved of Norwich vergers that the "Wicked M." tracery in the windows over the entrances to these ambulatories from the transepts was devised to evade the iconoclasm of the Reformers. With an inspection of St. Luke's chapel at the south-east angle, a glance at the fine fourteenth-century font with its sculptured panels of the Seven Sacraments and a peep up the steps across the apse to north-east, the survey of Norwich closed with a view of the ancient episcopal throne, in which the bishop, who stood in the ambulatory of the apse with his face to the lady chapel, obviously occupied the westward position while celebrating mass. The final slides were of a feature at Gloucester not paralleled in Norwich, the spacious and many-chapelled crypt; here, the entrance from the south nave aisle, the steps as seen from below, and the altar slab and piscina in the south-east chapel were the points selected for illustration.

In conclusion the lecturer said:—We have spent a long evening in inspecting and comparing two of the most picturesque and historically interesting of our great Benedictine churches, edifices in regard to which the hackneyed lines from "Il Penseroso" are peculiarly appropriate:—

Let my due feet never fail
To walk the studious cloister's pale,
And love the high embowered roof,
With antique pillars massy proof;
And storeyed windows, richly dight,
Casting a dim, religious light.
There let the pealing organ blow
To the full-voic'd choir below,
In service high and anthem clear,
As may, with sweetness to mine ear
Dissolve me into ecstasies,
And bring all heaven before mine eyes.

ARCHITECTS AND LABOURERS' COTTAGES.

THE Council of the Royal Institute of Architects of Ireland have issued a copy of the correspondence that has passed between it and the Local Government Board regarding the appointment of architects to supervise the erection of labourers' cottages under the Labourers (Ireland) Act, 1906. Since the date of the last letter from the Board a statement was made in the House of Commons by the Chief Secretary for Ireland that many highly qualified architects had applied to rural councils for employment at less than the maximum fee fixed by the Board. The Council state that, so far as they are aware, no member of the Institute, which numbers among its members most of the practising architects of standing throughout Ireland, has

applied at less than the maximum fee. The Council point out that many of the applicants are totally unqualified to act as architects, several of those appointed by the district councils having been objected to by the Local Government Board as unfit under the exceedingly wide qualifications the regulations under the Act, while in other cases the competition for the post proved abortive, there being on one applicant. The inevitable result of fixing such very low fees is, the Council hold, to render it impossible for an architect of any standing to apply and consequently inferior men are appointed. The Council wrote to the Board expressing their opinion that the fee of 2½ per cent. should only apply to exceptional cases, and submitted a list of amendments to the draft rules proposed by the Board regarding the employment of architects. Subsequently the Council asked the Board to receive a deputation for the purpose of submitting a statement dealing with the fees of architects, but the Local Government Board in reply stated that no useful purpose would be served by the deputation, as the matter was fully considered by the Board before prescribing the scale of fees. The Council then wrote explaining its suggested amendments to the scale of remuneration. The Council deprecated most strongly the power given to rural councils to invite tenders from architects and engineers with the object of inducing them, under the stress of competition, to undertake the duties required under the Act for a bulk sum. The Local Government Board was also asked to reconsider its decision regarding a deputation from the Council, but a reply was received stating that the Board carefully considered the views put forward on behalf of the Institute, but it was not prepared to reopen the matter.

ARCHITECTURE AND COLUMBIA UNIVERSITY.

THE following account by Professor Hamlin of the methods employed in the school of architecture at Columbia University is given in the *Architectural Record*:

In this school the work in design really begins for the majority of the students entering the school as novices in the middle of the first year of professional study. The first half of that year must, of necessity, under present conditions, be occupied with very elementary subjects. The students learn their orders and how to cast their shadows, how to lay washes, how to render backgrounds and foregrounds, how to handle the T-square and triangle, pencil and brush. They must learn the alphabet before they can begin to spell. By the middle of the first year they are ready to undertake small and simple problems in the use of the orders and the more familiar Classic forms of door, windows, pediments, balustrades, &c.; they are learning to spell with the one practical architectural alphabet which they have mastered.* By the end of the first year they are sufficiently familiar with the manipulations of architectural drawing and with the commoner applications of the orders and elements of architecture to be admitted to the problems entitled "Elementary Design." In these the subjects are simple buildings, in some cases making use of prescribed order; in other cases permitting of a freer range, and furnishing problems to each of which the afternoons of three or four weeks may be devoted. The student acquires his first discipline in the artistic considerations which distinguish a good plan from a bad one, a well-composed façade section from a poor one. Presentation counts for a great deal in these little problems, because the young designer must be made to acquire absolute mastery of his means of expression in order that in later and more important problems he may instinctively and without effort express his design in the most advantageous manner. When the student has acquired the prescribed number of "points" in design in this class, he is entitled to take those of the next higher division, called "Intermediate Design." The problems in this class are fewer in number and more elaborate than the elementary problems, and introduce more varied considerations of planning, composition and surroundings. They include such buildings as a post office, a public library, a crematory, &c.; buildings of a somewhat complex character but not yet of great monumental importance. The problems in this class require from four to six weeks.

* These elementary attainments are to be hereafter insisted upon as requirements for admission to the school, so that the student will then begin his work in design at the very outset of his school career, and a larger number of points in design will be required for graduation.

for their elaboration, and the juries in their awards place emphasis upon fundamental qualities of planning and composition, while they penalise slovenly and negligent presentation by exclusion from any awards. It is not the presentation, but the real design of the problem which determines the merit of the different solutions. In this class the student is required to win a larger number of "points" than in the elementary class. There is no prescribed length of time in which these "points" may or must be acquired, so that each student is advanced from one class to the other solely according to his own skill and advancement as shown by his work. Some pass through both classes in a single year, others take two or more entire years to accomplish the same result, and others do it in varying periods between these extremes.

The highest class of problems given to undergraduates at the school is termed "Advanced Design." The students who take this work are, for the most part, such as have completed all or nearly all of the prescribed lecture courses and classroom work, and are therefore free to devote their entire time to these exercises. The subjects of the problems are of a monumental character and extremely varied in kind. Variety of experience is a desirable acquisition for the young student, so that while concentration marks the work of the earlier classes, the purpose of the advanced problems is to give the student the widest possible range of experience. Churches and synagogues, technical schools and like problems, involving the grouping of many buildings; state capitols and town halls, presenting the problem of a single monumental exterior and complex planning; railroad stations, armories, hospitals and school buildings, furnishing practice in the meeting of highly specialised and practical requirements; a frontier custom house and lighthouse of picturesque character; decorative problems such as a monumental ceiling or a memorial arch, and problems involving a certain amount of landscape architecture—such is the varied scope of the problems in this class. It is interesting to note the effect of this training upon the student, as it shows itself in the final thesis design which must be submitted before graduation. The fuller grasp of the conditions dominating a problem, the increased sense of monumental fitness and artistic propriety, the gain in resourcefulness and flexibility of design, the greater ease and readiness with which the details are handled—these things measure the efficiency of the training that has gone before. The programmes of the problems in advanced design are purposely so framed as to require for the most part drawings of large dimensions involving bold delineation and breadth of handling. The student must learn to see things in a large way if he would handle them broadly. Little bits of drawings, however valuable in certain stages of his training, will never enable the student to work in a large-handed and masterly fashion. The buildings he is to erect are large objects, and largeness of scale and breadth of handling are not promoted by the study of either plan or elevation solely to the $\frac{1}{8}$ -inch scale. Alternating with these various "problems" (as they are technically called in the school) there are given out in each of the three grades a series of sketch-problems or "sketches," each to be executed entirely within ten or twelve consecutive hours, as exercises in rapid invention and delineation. The subjects of these sketches are usually small structures like rustic gateways, water-towers, band pavilions or the like, or else (especially for advanced students) compositions of a decorative character, such as a fireplace, a public clock, a ceiling, a tomb or an episcopal throne. The dominant considerations in judging these sketches are:—First, a good and reasonably artistic scheme of fundamental conception; and, secondly, a simple and effective presentation—clear, forcible and workmanlike drawing, with a touch at least of imagination and feeling in the delineation and colouring. The standard is purposely set high, and very few of the sketches are awarded even the coveted "pass," which counts for one point on the student's record, while a "mention," counting two points, is still more rarely accorded.

Of a still higher grade are the graduate problems given to post-graduate students, some of them candidates for the higher degrees. Four such problems occupy the academic year, forming a continuation of the discipline of the advanced design. These problems may be taken by graduates of the school resident abroad, doing the work in the Paris ateliers, or as special student-guests of the American Academy at Fieschi, the programmes being sent to them from Columbia University. The most important of the post-graduate problems are those given out as the competitions for the

resident or the travelling scholarships—one of each kind every year.

Supplementing all these problems in design are the special problems given out as a part of the work in the courses in the history of ornament, in architectural history and in construction and office practice. A Byzantine column and spandrel, a Romanesque doorway, a Gothic window or tomb, a Renaissance pilaster or entablature, a Renaissance ceiling, a Louis XV. mantel and wall-treatment, as exercises in decorative style; a chapter-house or a bay or west front of a Gothic church for practice in the Mediæval styles; a country house in wood and a city house, with the drawings worked out, figured and calculated as for the contractor's estimates—these or like problems serve to remind the student that architectural design is a practical art as well as a useful art, and that styles are studied not as mere curiosities, but as languages which can be used.

A paragraph may be devoted to the machinery of the instruction and its working. The school maintains three drafting-rooms, two of these on down-town streets, under the general care of two distinguished architects with the rank of professors in the University—Mr. McKim and Mr. Hastings—each represented and assisted in the actual work of instruction by younger practitioners specially qualified for such work, and a larger drafting-room at the University under two instructors, both likewise practising architects. These six gentlemen form a committee on design, meeting from time to time to prepare the programmes for sketches and problems, to discuss the general interests of the work and to select the jurors who, with one instructor from each drafting-room and the executive head of the school, pass upon the various designs submitted. The dates for handing in each problem are scheduled and the drawings rejected unless handed in by the specified dates. They are mounted on stretchers and hung on the walls in the "model-house," near Havemeyer Hall on the University grounds, and there examined and judged by the jury on an appointed day. The awards consist for the "problems" of "passes," counting three points, "mentions" counting four points, and "special mentions," given only for exceptional excellence, counting five points. The standard of the work depends very largely on these juries, which unite in their membership the academic element and that of the "outside" general practitioner. The partly changing membership of the jury makes it impossible for the work to fall into narrow ruts, or for students to win points by sacrificing fundamental qualities in their work to particular "stunts" or tricks supposed to be in special favour with the jury, for they never know who is to be on the jury. It likewise renders impossible the domination of the jury, month after month, by one person or one element, and thus two of the objections alleged against the jury system as organised in the great Ecole at Paris are effectively removed. No medals or prizes are offered; the awards are honours having a purely scholastic value, and as their number is not restricted and they are given for absolute and not merely relative merit, they become emulative rather than competitive distinctions, and any one or any number may win them, whereas a medal or prize can only be won by one man to the exclusion of all the rest, no matter how good their work. The two annual fellowships, one for resident and one for foreign study, are awarded as prizes, it is true, but not to students in the school. They are open only to graduates, and the competitions are established to determine the holders of the fellowships instead of the fellowships being offered to stimulate interest in the problems of the competitions.

All this is, however, the mere machinery of the teaching of design. The results depend upon the judgment, taste and enthusiasm of the men who administer the teaching and on the industry, imagination and enthusiasm of the students who work under them. At Columbia the six professors and instructors having charge of the design give only a part of their time to the work of the atelier. They are all practising architects, not academic pedagogues.

The cost of such an education at Columbia University is less than at most technical schools in the United States, the fees charged amounting to scarcely 50 per cent. of the actual expense to the University of providing the instruction. A student who pursues the entire course for the degree or certificate, if he spends four years in doing it, pays altogether about 860 dols. in fees. If by hard work and brilliant performance he can accomplish the same in three years, it will cost him less than 700 dols. This covers all the drawing, design, mathematics, history, theory and research, and includes the special fees for registration,

gymnasium, and graduation. But the University is also very hospitable to draftsmen who cannot afford either the time or the money for such a course, admitting them as "special" or "non-matriculated" students, to take whatever course or combination of courses they wish to pursue. All students who take only a part of the work pay accordingly; so that a non-matriculated student can, for example, take elementary or intermediate design and drawing at a cost of only 45 dols. per year; while for the classroom courses the charge per half-year is 7.50 dols. for each hour per week of lectures or classroom work. Thus every student may regulate his work according to his purse. It is perfectly possible for a draftsman who can arrange to command two or three hours two or three days per week, besides his evenings, to complete the entire course for the certificate in six or seven years, with a splendid gymnasium and an incomparable library (the Avery Architectural Library) at his command at all times.

CHICHESTER "GUILDHALL."

THE Rev. Prebendary James Fraser, formerly rector of Eastergate, and now residing at Chichester, with a view to the carrying out of the scheme proposed for the repair of the City "Guildhall" or Franciscan church in Priory Park, in a letter to the town clerk says:—

"You kindly gave me an interview this morning respecting the City Guildhall, and this letter is the result of our conversation. I have been connected with Chichester for more than fifty-five years, and love it well; also I am a venerator of St. Francis, and do not like to see a building which was once the chapel of a Franciscan priory left to decay. Therefore I gladly welcome the scheme for effecting the necessary repairs as soon as possible. Can we help on matters a little? Last autumn I inserted a legacy in my will for this purpose, but as time is pressing I am prepared to make a change, and I now offer to add (give) 50*l.* to each 200*l.* as it is subscribed, and I will give four of these fifties—*i.e.* 200*l.*—if 1,000*l.* is raised by subscriptions, and I shall direct that my legacy be reduced as I think best. Next, with respect to the employment of an architect, I consider that Mr. Prior has a first claim, but should he decline it or be willing to share it, I desire to strongly urge the appointment of Mr. Percy W. Lovell, Parliament Chambers, Great Smith Street, Westminster, who received an excellent training in Sir Aston Webb's office, and who has made a most careful study of Boxgrove Priory Church. May I ask you to lay this matter before my friend, the mayor, and the proper authorities?"

This letter has been submitted to the finance committee who repeat their former resolutions, the chief of which was that application be made to the Local Government Board for sanction to borrow from the Corporation's invested Consols for five years the sum of 500*l.*, to be utilised for the purpose of repairing the building.

GENERAL.

Copies of the first and second volumes of the first edition, 1576-9, of Androuet's "Des Plus Excellent Bâtimens de France" (40*l.*) were sold on Saturday at Sotheby's and the first edition of Columna's "Hypnerotomachia," the rare Italian architectural romance, for 100*l.*

The New Convent at Fenham Hall was visited on Saturday by about forty members of the Northern Architectural Association, under the guidance of the architect, Mr. L. Stokes.

In a Congregation at Oxford University the statute instituting a committee for the further organisation of the study of classical archaeology and establishing diplomas in classical archaeology to be granted after examination was promulgated and the preamble approved.

Mr. B. T. Batsford will publish in a few days a new and enlarged edition of Mr. Thomas H. Mawson's "The Art and Craft of Garden Making," the last edition of which was issued in 1901. The present edition will contain numerous fresh illustrations and schemes of gardens.

The Institution of Civil Engineers.—The fifteenth "James Forrest" lecture will be delivered by Dr. Francis Elgar, F.R.S., on the evening of Tuesday, June 18, his subject being "Unsolved Problems in the Design and Propulsion of Ships." The fourth engineering conference will be held on June 19, 20 and 21, commencing each day at 10 A.M., and the annual conversazione on the evening of June 20 at the Royal Albert Hall.

An Exhibition of Persian faience is now on view at Burlington Fine Arts Club. About 200 examples have been lent by English collectors. The exhibition will not be closed until July 14.

Toronto Architects complain, says the *Canadian Architect*, of the difficulty experienced in trying to procure competent draughtsmen. Even where they are prepared to pay the highest salaries it seems impossible to secure good men. Trial has been made of some English draughtsmen who came to Canada with highest recommendations from leading London firms, but their services have not proved satisfactory, partly on account of the difference between Canadian and British methods.

The Dublin Corporation by a majority on Monday agreed to increase the salary of Mr. Spencer Harty, the borough engineer, from 1,000*l.* to 1,500*l.* He has held office during forty-seven years, and was the lowest paid officer of his class in the United Kingdom if compared with others having similar responsibility.

Chester Consistory Court last week sanctioned two church improvement schemes. One was the restoration, at a cost of over 2,000*l.*, of the old church of St. Andrew's, Tarvin; the tower is a familiar landmark in the vale of Cheshire. The Chancellor described this edifice as a fine specimen of Perpendicular architecture. The other scheme was alterations, costing 1,000*l.*, at Holy Trinity, Gee Cross, near Stockport.

The Constitution of the committee which will manage the new Art School, Edinburgh, was discussed last week by the art school sub-committee of Edinburgh Corporation. The proposal was submitted that the committee should consist of fifteen members, of whom eight would be nominated by the Town Council, a certain number by the R.S.A., and the remainder (probably two) co-opted. The chief difficulty lies in the proportion of members to be appointed by the R.S.A. and the Board of Trustees. The proposal will be further considered by the full committee. The Town Council will be the ultimate authority in connection with the school, the committee doing the administrative work and being confined in expenditure to the estimates approved by the Council.

The Competitive Design by Messrs. John Gibbons & Sons, architects, Manchester, has been accepted by the committee for St. Michael and All Angels' new church at Bramhall, which will seat 500 persons.

The Glasgow Institute of Architects held an extraordinary general meeting last week. The resolution adopting new articles of association of the Institute, which have been framed in order that the members of the Glasgow Architectural Association may be admitted as members of the Institute, was unanimously passed. The Secretary reported that the president (Mr. James M. Monro) and Mr. Barclay had been elected representatives from the Institute on the governing body of the Glasgow School of Art for the next years from August 1 next. It was agreed to renew prizes annually allowed to architectural students in the Glasgow School of Art and the Technical College.

A Sub-Committee of the Lord Provost's committee for Edinburgh Town Council recommend that a reception be held on the occasion of the visit to Edinburgh of members of the Royal Institute of British Architects on July 4. The reception will be held in the City Chambers.

The Marylebone Borough Council have rejected by a large majority the proposal that the improvements and housing committee should consider the question of erecting a new town hall for the borough and of acquiring a site for the same.

Mr. R. C. Haworth, of Manchester and Colwyn, was offered to give a plot of land at Irlam for a free library, but was waited on by a deputation from the District Council and told that public baths would be much more acceptable to the district than a free library. Mr. Haworth agreed, therefore, that the land should be used as the site for public baths. At the subsequent Council meeting the survey was asked to prepare plans. The site adjoins that of the new Council offices now being built.

A Carnegie Research Scholarship of the value of 100*l.* has been awarded to Mr. D. M. Levy, A.R.S.M., assistant lecturer in the metallurgical department of the University of Birmingham. Mr. Levy proposes to conduct researches in the metallurgical department at Bournbrook, and has selected as his subject "The Influence of Sulphur on Carbon in Cast-iron."

THE WEEK.

is not the fault of a great many people in Manchester if art does not flourish in that city. There are several societies who take an interest in endeavouring to spread a taste for art among the humbler classes. But as yet Manchester does not possess an art gallery on a suitable scale which would be adapted to educational purposes. It seems to be generally agreed that the erection of one, being a necessity, must be shortly undertaken. The citizens have contrived to compete with other places in works of public utility, and yet they have to confess that as respects art Manchester is not on a level with Liverpool or Birmingham. The removal of the infirmary will leave a fine building which could not be better utilised than for educational purposes, including an art gallery. But some economists appear to be of opinion that it is not necessary to erect a new building, for the old infirmary could be altered into a series of galleries at a comparatively small expense. The removal of the infirmary would not have been so generally approved if people did not believe that an old hospital was a danger to all who entered it, no matter how brief might be the period. It was not the practice to line the walls with materials in which microbes would be unable to find shelter, and if properly scrutinised the condition of the Manchester infirmary would be found to contain sources of danger which would cause a general panic. To convert such a building into picture galleries would mean the removal of the pleasure with which pictures could be seen, and visits to it would be only under compulsion. The sooner such a scheme is wiped out of official records the better it will be for the credit of Manchester and its inhabitants.

THE prices given for English works at the sale of DEEDEMAYER'S collection in Paris were not as liberal as those paid of late years in London for works by the particular artists, but they denote an advance in the appreciation of English art. What is most remarkable is the importance attached to portraits of English artists. It is doubtful whether a portrait of a French artist would realise over 6,000*l.* at an auction in London, but the sum of 160,000 francs was obtained for BURN'S portrait of *Miss Tighe*, and 130,000 francs for BURN'S *Mrs. Monteith*. The highest price for an English picture by REYNOLDS was 60,000 francs for his *Schindlerin*. A portrait of *A Princess* by GAINSBROUGH cost 43,000 francs. LAWRENCE'S *Charles and his Daughters* was sold for 110,000 francs. HOPNER'S *Mrs. Home* realised 78,000 francs, and his *Miss Raine* 102,000 francs. The paintings which were not portraits did not attain more than moderate prices. JOHN CONSTABLE is supposed by some authorities to have revolutionised French landscape painting. The two views of the river Stour were the most coveted, and were sold for 32,000 francs and 55,000 francs respectively. BONINGTON was more highly valued than an English painter, and it may have been on that account no more than 3,000 francs was given for one of his works. WILKIE'S *John Knox Preaching to the Lords of Congregation* was sold for the credit sum of 2,100 francs. TURNER'S *Lake of Thun* realised only 6,800 francs.

THEATRICAL performances have been so successful in several years in the Roman Theatre of Orange, it is not surprising that an attempt would be made to produce the effect of classic drama in Timgad, the ancient city of Algiers. The play selected was the *Altre* of POYZAT, in which the ancient story of the death of AGAMEMNON is retold. More Arabs than Christians were present at the performance. By

utilising the ancient theatres the French give a lesson in archaeology which is likely to be more effective than the reading of any description. The spectators are able to realise the arrangement of an ancient Roman theatre, which is not easily done by the aid of drawings alone. The revealing of antiquity also suggests the power of the French rulers to the natives, and many of them must draw the conclusion that the French are the legitimate successors of the Romans. Although there are Roman remains in England, they have not been utilised for spectacular purposes, and consequently they are incomprehensible to the majority of people.

THE Kent County Council may be said to have approved of the erection of a bridge over the Medway between Halling and Wouldham. The cost will be about 28,000*l.* That is a low sum for an important work. But the bridge is to be constructed of ferro-concrete instead of masonry. It is also proposed to erect a bridge of the same material at Aylesford, the cost of which is estimated at 10,000*l.* However, a great many of the inhabitants are in favour of the retention of the existing bridge. It is therefore proposed to hold a local inquiry at which the objections to the change can be publicly stated. A majority of the County Council have also agreed that as soon as possible a building for educational and other county purposes should be erected at Maidstone. At present the business of that department is transacted in hired buildings in London, and it is supposed that a building could be erected for 30,000*l.* which would serve, and besides be more convenient and economical.

THE connection between the motor car and architecture is generally unrecognised. The *American Architect* of the 4th inst.—which is practically the equivalent of a volume on concrete buildings—points out that architects can regard the expansion of automobile traffic with complacency. According to our contemporary the automobile craze is sure to be the direct cause of putting in the way of the younger architects many a pot-boiler. The automobile, moreover, is quite likely to have a very distinct effect on the architectural character of the buildings erected as summer "cottages" by the more wealthy. What do these "hill-climbing contests" mean? What is their use, if it be not in part to assure the future country gentleman that he may safely place his house upon a hill-top, no matter how steep the approach or how craggy the site? In the past many a man, attracted by the situation and enamoured of the view, has built an expensive house on a hill-top only to desert it in a year or two, after experience had shown how unendurable was the tedium and waste of time in crawling uphill in horse-drawn vehicles. But now the automobile makes practically any height a good building site, and with that fact established will come a revival of the discussion of whether in a building designed for such a site horizontal or vertical lines should predominate, whether silhouette or mass should count; and, just as the bicycle tours through the valley of the Loire had much to do with creating the present fashion for the pseudo-French châteaux sprinkled over the American country-side, so we may expect to find the automobile an active agent in the crowning of many a hill-top or craggy bluff with American adaptations of Rhenish castle or French *château fort*. Further, reinforced-concrete methods and materials lend themselves admirably, almost naturally, to the easy reproduction of the brute masses of castellated dwellings, and a contractor who would add heavily to his estimate if obliged to haul building stone to a hill-top site, will see that, with such easily divisible loads, and so readily handled, as broken aggregate and cement, he can figure teaming at a lower rate. It may be worth while for architects to be ready to meet a demand for castles provoked by the ubiquitous excursions of automobile parties.

CONCRETE COLUMNS.

THE recommendation of EMERSON was to be sparing of material in walls in order that it might be utilised in columns, which would afford more pleasure to those who looked on them. "Under the conditions of building construction," says Professor TALBOT, "columns may form a weak element in the structure. To overcome this, the working stresses should be kept low, and every precaution taken to secure proper materials, workmanlike fabrication and efficient inspection." The difference in views between the two Americans, the visionary and the engineer, or the theorist and the practitioner, is not wider than is usually found by experience. Columns can be very beautiful, but we should remember that they are as much intended for ornament as for utility, and on that account we should not make too much demand upon their strength.

This is especially to be remembered in dealing with columns of concrete. Fine monoliths, which are the most desirable material for shafts, are not always and everywhere to be found. But it is now possible to prepare excellent substitutes for them in many varieties of concrete, and the strength and stability can be increased by a combination with steel. To a professor of municipal and sanitary engineering, who also has charge of theoretical and applied mechanics in such a university as that of Illinois, the question of strength takes precedence in his mind before any consideration of beauty. Professor TALBOT, who holds the two offices, undertook an inquiry on the subject. The university authorities of America are not satisfied with the old European system of classroom teaching. At Illinois, for instance, there is an engineering experiment station for the purpose of carrying on "investigations along various lines of engineering, and to study problems of importance to professional engineers and to the manufacturing, railway, mining, constructional and industrial interests of the State."

In undertaking the investigation of the strength of columns care was taken to have them of sufficient size. From the days of TREDGOLD, an able man who was very poor, a great many experiments on the strength of materials have been made with little blocks. Now, as Professor TALBOT says, a small block of concrete is made in a manner different from that of a large column, and the resistance of the block may be exhibited in a different way. A professor or a skilled assistant who prepares a cube will exercise a care which is not to be expected from the ordinary worker in concrete. The Illinois columns which were tested were generally 12 feet high, and their section was 12 inches by 12 inches. They were put together by men experienced in mixing concrete, and the mixing was done with shovels by hand. For the purpose of comparison cubes measuring 12 inches by 12 inches by 12 inches, and blocks 9 inches by 9 inches by 12 inches, as well as cylinders 16 inches long and 8 inches in diameter were also tested. Care was taken to secure the sides of the columns by strips of pine, which were braced by cross-pieces of the material. The columns were kept fourteen days after they were made before any weight was applied. They were carefully placed in position in order that the weights might fall upon them fairly. The load was applied in regular intervals of 10,000 lbs. In one case the total weight reached 254,000 lbs., or in other words, the maximum load was equal to 1,709 lbs. per square inch. After being applied sixty-one days the columns crushed in middle of length, which was found to be a rather unusual part to exhibit weakness. It was without reinforcement from steel rods. It is needless to say other columns failed under a smaller weight, while some exceeded the figures we have given. The maximum stress per square inch varied from 2,004 lbs. to 1,079 lbs., the average of the eighteen plain concrete columns being 1,553 lbs. per square inch.

Although care was taken to approximate the making of the columns to ordinary practice, Professor TALBOT

says the conditions, such as they were, should be considered as more nearly constant than those to be found in ordinary building operations, and a greater allowance for variation should be made in designing concrete columns for buildings. The column of which the maximum stress was only 1,079 lbs. was "made hastily and somewhat carelessly, with the expectation that it would be used at an early age merely for practice in the use of the instruments and machine, and gives not on less stiffness, but a very low compressive strength. Some architects are likely to say it was not inferior to the average builder's column of concrete.

The columns reinforced with longitudinal rods at the angles appeared at first sight to exhibit rather anomalous results. In most cases the rods did not extend further than within half an inch of the end, and therefore the compression or bearing plates of the machine did not come into contact with them. If, as we have said, the average strength of the plain concrete columns was 1,553 lbs. per square inch, "the average strength of the reinforced concrete columns, based on gross area and without allowance for the steel, was 1,746 lbs. per square inch." That is a difference in favour of reinforcement of about 15 per cent., but Professor TALBOT suggests that care should be taken not to use too high working stresses in columns of the kind. The rods served as stiffeners to keep the concrete from bulging, but in the reinforced concrete used for constructive purposes and not for testing they would, of course, be arranged to share the bearing the load and enduring the strains. To what extent they were capable of serving would, of course, depend upon the size and arrangement of the rods. In the experiments it was found that the rods buckled after the failure of the concrete, and this fact suggests that a diameter of $\frac{5}{8}$ -inch was of little value against the indirect effect of the vertical-screw testing machine.

The columns of concrete alone failed suddenly, those which were reinforced by the rods indicated an approach of failure by vertical hair cracks. As a rule the failure occurred rather near the top or the bottom. The central part was not the weakest. The proportion of length to thickness appears to be of less value, regards flexure, than is commonly supposed. Professor TALBOT remarks:—"Even for 15 diameters we readily conclude from the calculated results of long column formulas, and also from the small lateral deformation found in the columns tested, that the difference in strength between a column 15 diameters long and 5 diameters long is less than the variation among several columns of the same length. The same conclusion may be drawn from the set of tests of columns of various length made at the Massachusetts Institute of Technology."

It must, of course, be borne in mind that concrete cannot be expected to act with the same regularity in resisting loads as columns built up of steel angles and plates. There are several remarks in Professor TALBOT's account of his experiments which are enough to suggest that in America there is an excess of confidence in the virtue of concrete, and that calculations respecting its strength can be made without much regard for contingencies. Professor TALBOT says:—"Caution should be used in accepting high values, because they may have been obtained from elastic deformations, or because they have been taken from short specimens affected by the restraint of the bearing-plates, or because they represent concrete of a much denser quality than would be found under the conditions of practical construction." The correspondence, however, between the experiments made at the University of Illinois and those of the Watertown Arsenal is remarkable. Much, of course, will depend upon the character of the cement. If the same brand is used and under similar conditions, it is to be expected that there will be similarity between the results. But concrete can be considered under the best circumstances as a heterogeneous material, and such things as time, weather

to be taken into account. The Illinois columns kept under conditions by which the warmer air at top of the laboratory could not be supposed to affect tests. And they were upheld in a vertical position the time they were made to the time they were used. In ordinary buildings similar precautions could be observed. And although sound concrete columns do not have their strength diminished by handling, could at least not be increased. Professor TALBOT's sum of the tests is not only novel but authoritative, with the corresponding report of "Tests of Reinforced Concrete T-Beams" is well deserving of attention by every architect who intends to employ concrete in buildings.

SIR BENJAMIN BAKER.

Y the sudden death on Sunday last of Sir BENJAMIN BAKER, England has lost her principal consulting engineer. His sphere of activity as such as wide as the employment of English capital, or, in other words, there were few parts of the world where his advice was not acted on. It was only three or four years ago his opinion was put forward as a sufficient support of the theory that the projected sewer of the London County Council was not likely to be a source of danger to St. Paul's Cathedral. Shortly before he gave his opinion as the representative of the Council in respect of the alleged danger to the Royal Observatory at Greenwich by the generating station. In the report of Lord CROMER his opinion respecting the Forth bridge across the Nile was printed. If the reports he prepared concerning engineering works during the last year could be published they would form a substantial volume.

If he were considered simply as a consulting engineer, he might be easily supposed Sir BENJAMIN BAKER was one among a large number of safe men who are to be found in Westminster. With no less justice he might be considered as the pioneer in a new era of engineering science. By a remarkable coincidence Sir BENJAMIN BAKER served as a connection between old and modern systems of engineering practice. When he became known in Parliamentary committee-rooms at the Institution in Great George Street he was assistant to the late Sir JOHN FOWLER. That sturdy shireman, who had taken part in the opposition to the STEPHENSONS, contrived to attract a great many able men to his service. His Metropolitan Railway was a big scheme in which several auxiliaries were employed. He seemed, however, to prefer that his assistants should start enterprises of their own rather than become permanent assistants in his London office. BENJAMIN BAKER was, however, retained there, for he was one of the latest on whom FOWLER relied, and he gave him many opportunities for the exercise of varied knowledge.

BAKER was not satisfied with repetitions of the structures which FOWLER and the other patriarchs of the profession had designed. STEPHENSON'S bridges with their web plates had been superseded by lattice girders, and these again by truss bridges. BAKER did not consider that construction was exhausted, and he wrote a series of papers on long-span railway bridges which he afterwards published in a small volume. The investigations were remarkable as coming from a man who had to exercise so important a rôle in one of the most important offices. They displayed a mastery of mathematics as well as of construction. A great many looked upon him as mere speculative efforts, but JOHN FOWLER was too shrewd to allow BAKER'S conclusions to remain untested. It became necessary to bridge the Firth of Forth with wide spans, and FOWLER found it easy to persuade the directors of the railway to allow a bridge on BAKER'S principles to be constructed. Practically it may be said that an arm of the sea about one mile in length is crossed, two of the spans being of 1,700 feet each and two others of

675 feet each, with some of less dimensions on either side. The bridge had to be constructed so as to allow a headway of 150 feet above high water. Notwithstanding such exacting circumstances, there was practically no interruption to the navigation of the Firth of Forth. This was in a large measure due to the fact that as the bridge was constructed on the cantilever principle the girders were mainly put together on the land, and were compelled to serve as staging for other parts. The Britannia Bridge had no greater span than 465 feet, or not one-third of one of the large spans of the Forth Bridge. The economy of the system was also remarkable, for although between 40,000 and 50,000 tons of steel were used, every ton has definite work to perform. The bridge was the forerunner of several others on the same principle, and BAKER well deserved the knighthood which was conferred upon him when it was opened. The Forth Bridge should never be mentioned without some reference to the constructive genius and organising power which were exhibited by Sir WILLIAM ARROL, who obtained the principal share in the contract for the superstructure.

FOWLER was the first English engineer to be employed in the designing of great works in Egypt. In them BAKER, as a matter of course, took some share. It was not therefore extraordinary that he should be asked to co-operate in the great project for increasing the water supply of Egypt by works at Assouan, which would have the effect of increasing enormously the storage of water, by making the Nile become a reservoir for a length of 140 miles. To some extent the project had been worked out by Sir WILLIAM WILCOCKS, who after ten years' service in India was appointed to the reservoir section of the Egyptian Public Works Department. But the assumption of the office of consulting engineer by Sir BENJAMIN BAKER gave a new form to the enterprise, enabled large sums of money to be assigned to the work, and gave confidence to intending contractors. The work was carried out by Sir JOHN AIRD, and at times 12,000 men were employed. When the dam was completed some wonderful mathematicians, who think that diagrams and formulæ rule the world, raised doubts about the safety of the structure, but if experience is a test all their predictions have apparently been futile. The dam not only served the purpose contemplated, but it has been found advantageous to increase its wonderful utility by giving it additional height. Lord CROMER declared that all the rumours about the want of stability had not the smallest foundation, and that all who were competent to judge had entire confidence in its security. It was to be expected that with so large an army of workmen careless joints in the masonry would occasionally escape supervision, but, taking as tests the rush of water through the sluices and the continued velocity with which the water has been flowing, the results are remarkable.

As a member of the Institution of Civil Engineers BAKER went through the usual gradations until he arrived at the presidency. It seemed fitting that he should be the first to deliver an inaugural address in the new building which the late CHARLES BARRY had designed. It suggested some of BAKER'S own qualities when he pointed out on the occasion a few of the examples of want of foresight afforded by really great men. Sir ROBERT PEEL had blocked a Bill in Parliament for a central railway station which at the time could have been made on economical terms, and would have obviated many difficulties which have since arisen and are never likely to be remedied. Lord BROUGHAM, although he was supposed to be a man of science, tried to make it illegal to have greater speed than thirty miles an hour on railways. Lord PALMERSTON, acting on the report of ROBERT STEPHENSON, scouted the Suez Canal as if it were a bubble scheme to impoverish English capitalists. SMEATON could not believe in the steam-engine until he saw many of them working, and TELFORD was not less dubious about the practicability of railways. BAKER was not the man to be indifferent to those lessons.

He was generous towards projects, but he took enormous pains in making experiments where they were possible before he came to a conclusion.

His evidence in connection with the collapse of the roof of the Charing Cross terminus on December 6, 1905, is enough to show his great care in investigations. Many causes had been assigned for the breaking of the tie-rod, but it was mainly by the course of reasoning supplemented by experiments of Sir BENJAMIN BAKER that it was ascertained that the fault was committed at the ironworks, for although the bar was made up of several pieces they were not all properly welded, and therefore the rod used was never fitted for its purpose. What was no less remarkable was that the rod was supposed to be tested under hydraulic pressure without the flaw having been discovered. The outer welding was excellent; it was at the core the defect was found.

From the circumstances of his position he was allowed few opportunities to display his inventive power. Sir BENJAMIN BAKER had, however, invented a shield which was considered to be well adapted in connection with underground tunnelling. It would not be considered etiquette on his part to insist on its use on any line with which he was connected. Everyone seemed to have confidence in his opinion, and he was therefore a formidable Parliamentary witness. The Government as well as local authorities were equally desirous to obtain his advice under difficult circumstances, and it is not unlikely that the strain upon his physical and intellectual powers during several years had much to do with his sudden death on Sunday. He had attained his sixty-seventh year, but he appeared to be as active as a much younger man. His name will not be soon forgotten by his brother engineers.

BELGIAN ARCHITECTURE.

IT was admitted by FERGUSSON that in the Middle Ages architectural magnificence was characteristic of Belgium. In endeavouring to account for subsequent indifference to it, one of the causes he gives is that the Belgians are not essentially an artistic people. He held doctrines of his own concerning races and their connection with art, and if the Belgians were not an illustration of what he laid down the fault was theirs, and not that of his theories. To an ordinary observer there is no country in Europe which, amidst difficulties, exhibited so strong a predilection for art. The reader need not be afraid that we are about to write a history of the country. But a very few facts will suggest its peculiar circumstances.

In the fourteenth century Belgium or Flanders was ruled by its own counts. In the fifteenth century it became part of Burgundy. Then it fell into the hands of the Emperor CHARLES V. His son ruled it for several years. Afterwards it became part of Austria. In the middle of the seventeenth century it was held by France. It again passed into the hands of Austria, that ruled it with the exception of a few years, when it was seized by the French, until the period of the French Revolution. Subsequently it was part of the French Empire. It was to be expected that with a variety of masters there would be many changes in taste, for whatever might please the rulers would obtain the favour of people who were peaceably disposed.

In 1814, when there was a partition of some parts of Europe, it was a difficulty to decide the fate of Belgium. If it were not through fear of the growing influence of Prussia it would now have belonged to that country, a circumstance which is remembered in Berlin. England insisted on it being separated from France. Austria knew by experience the impossibility of ruling it. Finally Belgium was incorporated with Holland.

The fate of the country at that time was curiously suggestive of many features of Belgian art. The peculiarities of the Dutch painters were easily imitated by Belgian painters. A Belgian *Kermesse* by RUBENS does not differ much from one of the crowds of Dutchmen

which were so often represented in Holland. TEN and BRAUWER, who were Flemings, are often supposed to be Dutchmen. On the other hand, the influence of French building was most marked. Indeed it might be said that the art of Belgium in general swayed between its northern and southern neighbours. Since Holland has lost its influence with Belgian art, while France has gained much of its old supremacy among them.

The Dutch Government were well aware of this before them in dealing with their new possession. Three months exactly after the fate of the French Emperor had been finally decided at Waterloo an ordinance was issued that the Dutch language was to be the official tongue of Belgium. Language is closely linked with liberty and much else, and although they are so near neighbours few of the educated classes in Belgium could express themselves in the dialect of Holland. The consequence was that not only in Cabinet Councils but in all Government departments Belgians were in a ridiculous minority. Out of thirty-nine diplomatists only nine were Belgians. In the Home departments there were eleven Belgians to thirty Dutchmen. There were six times as many Dutch commissioned officers in the army as Belgians. The Supreme Court was at The Hague, and litigants had to travel there from all parts of Belgium. As was to be expected, the Belgians conspired, and the success of the Paris Revolution of 1830 caused an uprising in Brussels. The Dutchmen very wisely did not make much difficulty about a separation.

Although the Belgians might not be considered men of the FERGUSSON class as essentially artistic, after they became independent they set about building with an enthusiasm that recalled Mediæval times. One must remember that the people in those days looked upon their freedom from Dutch officialdom as a blessing from Heaven. In consequence the revolution barely ended when they began to erect parish churches and convents. The majority were more or less Renaissance in character. The adoption of the style was remarkable, and suggested southern influence. A Jesuit father designed two churches for the Order at Ghent and Brussels, in which Ionic columns were employed in the interior. In one or two churches an attempt was made to use a Byzantine type. Although so many buildings arose throughout Belgium the earliest effort to employ Gothic was not made in Antwerp until 1818, when a parish church in one of the suburbs was commenced, and which was claimed to be the first Gothic building erected in Belgium in the nineteenth century. The architect was M. BERCKMANS. In 1847 a more remarkable building in the same style was erected at Namur from the designs of M. DUMONT, while a third was erected at Bauffe.

M. SUYS, who was the architect of the church of St. Georges, Antwerp, is supposed to have given a new turn to architecture. He was a pupil of PERCIER, one of NAPOLEON'S architects, and as Belgium was then a province of France, he was enabled to win the Prix de Rome, and spent more than the required time in Italy. He was recognised as the great authority on architecture in Brussels, and through his influence Italian style became more firmly established in Belgium. The new National Gallery in Brussels was designed by him, and it may be remarked that Scottish granite was used for the immense columns, although nowadays Belgium yields an abundant quantity of the stone. In the National Bank of Brussels BALAT, however, preferred to imitate the French style of LOUIS XVI. Some churches were erected in the Gothic style, while in others the style of Romanesque was preferred, partly because the painting was exercised by several artists, and partly because panels for the display of religious pictures were considered a necessity.

The skill exhibited by the painters produced an unanticipated effect in architecture. The most precious treasures possessed by Belgium are the town halls

no other country of Europe are such memorials to be found of the power of burghers. After the Revolution of 1830 several of the most ardent painters devoted themselves to national subjects. It then became manifest to the humblest peasant that, in spite of the anomalies of the Government of the country in the past, Belgium had then a history of which the people could be proud. Several of the town halls were decorated with paintings which helped to explain historic incidents which occurred in their vicinity. So much success attended those efforts, it was but a step to the revival of Belgian architecture, not only for new municipal buildings, but for banks, business establishments and private residences. Some of them may appear allied to examples in Holland, but in the best work there are features which are distinctly Belgian. The increased interest which quarrying obtains has revealed the existence of a marvellous variety of building stones, and the architect has therefore at his command materials which are adapted to all necessities. In fact, there is no country in Europe in which there

seems to be a more hopeful likelihood of a national style, in which Renaissance elements will be fused into compositions which can recall the peculiar position of Belgium as a country which was closely related to many foreign nations. It is possible that desires may again arise for a style which will be more distinctly French, but at the present time the native style enjoys most favour.

It may be said that POELAERT's colossal building, the Palais de Justice in Brussels, has nothing which can be considered as native about it. Although it does not recall any other building in Belgium, it is an example of the free treatment of Classic which in a measure corresponds with other buildings. It has not, however, inspired efforts on a smaller scale which would recall it, and probably the effect of the law courts is to a large extent dependent upon the almost countless repetitions of columns and other features. It may be taken as an example of the skill which is found among Belgian architects, and which has been displayed in a variety of works which are well deserving of study by Englishmen.

DOONE, SUNNINGDALE.

THIS residence has recently been erected and completed from the designs and under the superintendence of Mr. HENRY T. CHALCRAFT, architect, of 48 Bishopsgate Street Within, E.C., and is situate on the Ridge Mount estate, overlooking the Sunningdale Golf Links. The walls externally are finished with white rough-cast, and the roofs are tiled; the windows have steel casements and lead lights.

SAXON TOWER, MARTON.

IN a letter to the *Lincolnshire Chronicle* the Rev. J. H. Mallinder writes:—

Will you kindly allow me to make an appeal to your readers to help us in our earnest endeavour to save our fine unique Saxon tower, which is in great dangers? In 1868 the north side of the tower was unfortunately undermined, and heating chamber constructed underneath the foundation, which has caused a serious settlement. The north-west and east walls are badly cracked, and I am sorry to say that those in the north wall are beginning to enlarge. Its condition is causing much anxiety, and a strenuous effort is being made to raise the necessary funds for its repair, so that the work may be put in hand and carried out with as little delay as possible. The construction of it being unique, its ruin would be an irreparable loss. The parish being poor and the need of repair very pressing make it absolutely necessary to appeal to the patriotic public to help in our earnest endeavour to save this noble example of ancient workmanship. Mr. Stebbing has written the enclosed interesting and instructive account of church towers in general, with special reference to our tower, and as he very kindly wrote it for the benefit of our restoration fund, it is very earnestly hoped that all who read it will send a contribution. Marton Church is archæologically an extremely interesting building, and is architecturally an epitome of English history from early Saxon times up to the sixteenth century. A great antiquary calls it "a museum of architecture." All lovers of ancient architecture will surely be interested in the repair and preservation of such a noble and venerable building. An account has been opened at the Union of London and Smith's Bank, Lincoln, into which donations may be paid. This appeal has the full approval of the Bishop of Lincoln, Bishop of Grantham, Archdeacon Bond, Dean of Lincoln and Chancellor Crowfoot. Sum required 600*l*. In bank or promised, 230*l*.

Description by W. P. D. Stebbing, F.G.S., Mem. R. Arch. Institute.

As the writer of these notes has given a certain amount of study to the architecture of some of the earliest ecclesiastical buildings in England, and as he was much interested in your church, which possesses some almost unique features of this early period, he, with your vicar's consent, would like to point out to its lovers, as well as to those who appreciate Mediæval buildings, what it is that makes their fine old village church a possession of great value to the dwellers around it, and to the people of England as a whole. Although the writer had made notes about the tower before his attention was particularly drawn to it, it is your vicar who deserves the credit, as it is his zeal and love for his old church that brought before the writer the feeling that Marton possesses that which ought not to be hidden under a bushel. It is to the vicar's appeal in the *Times* of August in last year that this account of the tower, and early church towers in general, is due. This tower is only one of the features of interest about the church, but its age and the danger it is in make it of the greatest importance. It is well known that towers or tower-like structures have been built in all ages and for all purposes, but we now mainly think of them in connection with some sacred edifice, for the advantage of which they were specially developed some time after the Christian era. They may be said to be even now the beacon that points out that there is some building for the diffusion of religious knowledge, and in fair weather or foul the bells hung in their highest storey have been always calling for the same purpose.

The first churches to be built were poor, humble little erections, both because the structures were temporary, the converts few and the necessary knowledge for constructing a better building was wanting; but when this country, for instance, became more civilised and large tracts were Christianised, larger buildings were wanted, necessitating greater architectural skill, especially in the main centres; this again led to a more elaborate ritual and a development of arrangements for calling the people together at many different times and seasons. Before clocks were invented, and when the knowledge of reading and writing was nil, our ancestors had to depend on their ears and eyes to know the times of the many Mediæval services that they were expected to attend, and in church their only way to learn the true Christian life was from pictures and example. Church towers were first built in Italy, but in spite of the early dissemination of Christianity over the country and the early elaboration of the Romish ritual, even there they

cannot be said to be much over 1,200 years old. From that country the trend of the tower, with the growth of the arts of peace and religious feeling, was northwards to Germany, and thence along the Rhine valley, where a local style grew up, and so across the sea to England. This development, however, was not the affair of a few years, for, as far as can now be ascertained, the first church tower was not built in this country till the end of the ninth century, or, roughly, 200 years after they were first built in Italy. In that country the early type of tower is a tall, slender structure, with openings near the top, somewhat similar to those in Marton tower, but as a rule the bells, instead of being hung inside, are hung in the openings themselves. This means that the bells could not be very large, and that there would not be more than one or two of them.

There is no doubt, considering the rudeness of the period, that the English village tower was built in its typical form because it was the simplest for the purpose, but there are exceptions, and these, as Professor Baldwin Brown has, I think, fully proved, are clearly modelled on structures still to be seen in the Rhine valley, and many details in our simplest examples may also be clearly traced from the same source. Those towers, how many we know not now, as only one remains, and that in Sussex, which were roofed with the peculiar pyramidal German cap, must especially have given a foreign look to the countryside. Unhappily, the existence of any of the earliest English church towers is doubtful, but it seems from documentary and other evidence that they would hardly be more than 1,000 years old, and meantime the country which is now France was advancing in civilisation, and being near to England had a considerable amount of influence over the architecture, and incidentally the towers of our churches, so that when we arrive at the approximate period when Marton tower was built, getting on for 900 years ago, there may very well have been a combination of Italian, German and French feeling in the mind of the old Saxon master builder who had to do with its erection these many hundreds of years ago.

Now, in looking at this tower of Marton Church, I think everyone will agree that it has a distinct air of its own; it is not like a tower of the Norman style, and still less like one built about the year 1200 or later. To put it simply, it belongs to a class distinct in type, and it is now clear that such were built by Saxon or Scandinavian workmen, under the supervision of a man who was not a Norman either by birth or bringing up, even though they may have been built after the Norman conquest. Although the proportions of Saxon towers differ, slenderness is a marked characteristic in many cases, and Marton is of this type. These early towers commonly again are inset at the top belfry stage, and if not reduced in size at this point have a projecting stone string-course to divide off this part of the tower from that below, and this band, with a proper artistic sense, usually acts as a dividing line between the comparatively light and ornamental belfry stage and the plain austere walling below. This is the case in this tower, as there is little below the string-course to arrest the attention. We have evidence that towers of this early period, in their own day, were used for many purposes besides belfries, such as dwelling-houses for the priest in charge, watch towers and watching lofts, and as places of security. Frequently, doubtless from a sense of greater safety, although with no idea of defence, no external doorway was built into the tower, the only admission being from the body of the church. The want of this additional opening may, however, be merely due to the desire to save expense, as poverty and inability to construct tower staircases undoubtedly accounts for their absence except in a few instances, and in two of these exceptions they are later additions to an earlier tower. In the smaller towers, too, like Marton, which seems to have had no west doorway, there may have been no floors in them at all.

Marton tower, except for the cement covering it, the modern-looking window of Norman type low down in the west wall, and the ruined battlementing and pinnacles, is almost in its original condition, and thus shows how plain these early structures were. Except in the construction of the walls, it is typical of the prevalent style of the period, which Professor Baldwin Brown and I (if I may link my name with his) put down to the first half of the eleventh century. Sorry as I am to say it, I believe the delightful and almost unique method of building exhibited in the walling of the tower was never intended to be seen. There is no doubt that many of the Saxon towers now existing were covered, except for the quoins, with a thin coating of

ment; their rubble walling was built too roughly and of so small stones intentionally to have been exposed, and I doubt not that that was the case here. The angles of the tower, of course, are built of massive stone quoining, but the actual walling is mainly of very carefully constructed herring-bone work of an unusual type, and I believe only to be seen elsewhere, as Professor Baldwin Brown points out, in a fragment of the wall of the very early Norman bell keep at Tamworth Castle. (A shell keep in its simplest form was a fortified wall surrounding the top of an artificial mound, and so was intermediate between the Saxon palisaded mound and the wholly masonry structure into which it developed.) With all its other purely Saxon characteristics, we cannot consider Marton tower in any way to be Early Norman, but the thickness of the walls, viz. 3 feet 6 inches at the ground level, is part proof of its late Saxon date. The material used for this walling is a limestone that splits up into thin slabs, and this, in pieces of much the same size, has been laid, not horizontally, but sloping—each course consisting of slabs leaning one way or the other, and roughly at right angles with those above and below. This forms typical herring-bone work such as may be seen in a belt some distance up in the tower of Broughton Church, in the north of the county, but here the construction has been further elaborated by each course of herring-boning being isolated from its neighbour by two horizontal layers of the fossiliferous stone. The effect as a whole is extremely ornamental, and these horizontal courses between the others doubtless aid the strength of the masonry by binding it together. Herring-bone work is by no means rare in the eleventh century, but I think the dwellers round Marton may pride themselves on possessing one of the finest examples of this form of construction in existence.

Of other noteworthy details about the tower those interested may notice in the first stage a curious little opening shaped like a keyhole, a form practically confined to a few Saxon towers in Lincolnshire. This little window in addition has a ring of stone, termed a hood mould, running round the semicircular stone in which the upper half of the keyhole is cut; time and other circumstances have dealt hardly with the actual opening, its outline now being not quite perfect. Immediately above this light hole is a crudely carved head in flattish relief projects from the wall. With the evidence of several examples of sculpture remaining in this and similar positions, it is attractive to suggest that this head may be the remains of a figure of the Christ, otherwise, if no traces of the body are found during the restoration, I am afraid we must consider it merely an isolated fragment of sculpture built in at some period to preserve it. I hope the former suggestion will prove to be right.

Continuing our survey, we find that the walls of the belfry stage, as in most Saxon examples, are reduced in thickness by being set back six inches, or so from the line of the walls below. In the lower part are placed the openings to let out the sound of the bells, a similar pair in each case. In design and construction these belfry openings are similar to many others of about the same date in the country, although there are slight differences in detail; in this case the special feature being a semicircular incised groove which runs round the solid stone heads of the openings, and slightly relieves their otherwise plain surfaces. The particular construction which differentiates these early belfry apertures from those of later date is shown as "mid-wall work," the term meaning that the heads of the openings are carried by a single support or shaft placed mid-way through the wall. As the shaft alone, however, would not carry the stones composing the whole thickness of the wall, this is arranged for by a massive pier known as the "through stone," which rests on the shaft and carries the various stones making up the heads of the openings. The "through stone" generally projects slightly beyond the face of the wall, and the shaft commonly is as a simply shaped capital and a base to help to distribute the weight. As usual, through time and decay all trace of the original termination of Marton tower has gone, and we have instead a flat roof hidden by battlementing and angle iron, doubtless of the fifteenth century, which in their turn are fast mouldering away after a life of seemingly somewhat similar duration to the work erected by our Saxon ancestors. Thus at greater or less length have I run through the several features that prove the age and interest of the ancient tower of your parish church, a tower that, on the one hand, is doubtless a connecting link with the early missionary preachers who made the site sacred

and possibly helped to rear, if the fragments do not commemorate them, the carved crosses of Celtic type which—now broken up—may be seen in the west wall of the south aisle, and on the other is a survival of the early church in England, which, under Henry III., partly lost its independence to the Pope, but which once again recovered its full status as a national church at the glorious Reformation.

HIGHLAND CHURCHES.

THE special building committee of the advisory committee of the United Free Church appointed to inquire into the needs of the Highlands have so far completed their labours as to make an estimate of the probable extent of the scheme possible. Three sets of plans have been adopted for both churches and manse, and these will be sent out to congregations who are required to build, in order that they may choose which of the three is most adapted to their requirements, while it is proposed to allow local architects to be employed to make any deviation of the plans which the local situation demands. In the event of there being no local man available, the committee in Edinburgh will appoint an architect to make the necessary alterations. In regard to the manse there is likely to be more diversity of opinion and more objection to anything in the way of uniformity of design, but here also local architects will, it is expected, be allowed to make deviations, provided these are submitted to the building committee for their approval and involve no additional expense.

The assessors have issued their awards as under:—

For churches—1, "St. Andrew," Messrs. Greig, Fairbairn & Macniven, Edinburgh; 2, "Ossian," Mr. Alexander Cullen, Hamilton; 3, "Unity," Messrs. J. W. & J. Laird, Glasgow.

For manse—1, "Unity," Messrs. J. W. & J. Laird, Glasgow; 2, "Ossian," Mr. Alexander Cullen, Hamilton; 3, "Tigh a' Minist'ir," Messrs. Clarke & Bell, Glasgow.

The assessors further recommended for honourable mention designs by the following (arranged alphabetically):—

For church buildings—"Anon," Messrs. Robert J. Walker & Thomas Ramsay, Glasgow; "Caterthune," Mr. D. Wishart Galloway, Brechin; "Emergency," Mr. David W. Robertson, Edinburgh; "Loco Citato," Mr. W. Carruthers Laidlaw, Edinburgh; Star (device), Messrs. Clarke & Bell, Glasgow.

For manse—"Comfort" (red letter), Mr. Charles Davidson, Paisley; "Comfort" (black letter), Mr. H. Foxall, Carlisle; "Gael," Messrs. Robert J. Walker & Thomas Ramsay, Glasgow; "St. Andrew," Messrs. Greig, Fairbairn & Macniven, Edinburgh; "Simple Order," Mr. Victor D. Horsburgh, Edinburgh; "Red Seal" (device), Messrs. John C. T. Murray & J. A. Minty, Westminster; "Whin," Mr. W. Stephen Gibson, Wishaw.

Until the Executive Commissioners have completed their work and allocated all the congregational property, and until the destination of the proprietary churches is settled, the committee cannot definitely decide what the extent of the building scheme may be, but it is understood that something like eighty churches and eighty manse will have to be provided. The estimated cost of the churches is expected to average 1,000*l.* Such a large congregation as that of Dingwall, for instance, will require an edifice which may cost even 4,000*l.*; but, on the other hand, many of the evicted congregations in country districts will be able to adequately accommodate themselves in churches costing considerably less than 1,000*l.* The average cost per manse is to be about 800*l.*, and the expectation of several members of the building committee is that a sum of 150,000*l.* will meet the requirements of the evicted United Free congregations in the Highlands.

The Edinburgh Dean of Guild Court last week passed plans for the new municipal art school at the cattle market, Lauriston. Mr. J. M. Dick Peddie is the architect, and it is estimated that the buildings will cost 40,800*l.* It may be recalled that the site of the school is the north part of the market, and the building will be in the form of a parallelogram, measuring 370 feet by 126 feet. The hewn work will be of red stone, and the rest of the wall surfaces of common rubble from Hailes Quarry. The work is to be completed in thirteen months, and the Corporation have now intimated that on and after May 31 the western portion of the cattle market area will cease to be used for market purposes.

NOTES AND COMMENTS.

THE disposition of the wall-space in the French Salon is so difficult that sooner or later the painters are likely to draw lots for a place on the line. At the present time each member of the Society of French Artists has a right to be considered *hors concours*, and therefore can claim space for two paintings on the coveted *cimaise*. At present the number of painters who possess the privilege is 550. In other words, the superior position is assigned before the exhibition opens to 1,100 paintings. If the average length of each is taken as a metre, or 39 inches, which is a very low estimate, a length of 1,100 metres is bespoke. Now the total length of the line in the different rooms only amounts to 1,000 metres, and it is therefore one-tenth too short for the works of the *hors concours* alone. Every year, however, works by outsiders are sent in which, in the interest of the Society—financially and popularly—should be found in positions where they could be appreciated. That is impossible so long as the present arrangement holds good. It is therefore proposed that all the painters who have a claim on the line should from henceforth send in one work instead of two. But it will require many heated discussions before a majority of the members can agree to such a self-sacrifice.

THE second divisional volume of "The Modern Plumber and Sanitary Engineer," by sixteen specialist contributors under the editorship of G. LISTER SUTCLIFFE (London: The Gresham Publishing Company), has appeared. It relates to such varied subjects as copper-roofing, zinc-roofing, corrugated-iron roofing, water-supply, the latter being treated with ample details of all that relates to water for domestic use. A great many apparatus and appliances are described. The care taken in making explanations clear is suggested by the 200 illustrations which appear in the volume, and all of which are drawn with care. The work promises to be the standard authority on twentieth-century plumbing. Such late works as the copper domes on the Sessions House, Old Bailey, and the Gaiety Theatre are among the examples noted.

It has been repeatedly announced that the French Minister of Colonies had arranged to depart with his large staff of officials from the Pavillon de Flore, which survived the burning of the Tuileries, in order to avoid the possibility of a great fire in the Louvre. The danger continues to exist. It is possible, however, that the safety of the contents of the picture galleries will shortly be secured. The President has approved of the plans prepared by M. REDON for the alteration of the monastery in the Rue Oudinot, which is destined to become the French Colonial Office. As the proposed works will be limited to the transformation of the monks' cells into offices by removing the walls between them and converting the larger rooms into places of audience, they can be expeditiously completed. The undesirable tenants are likely to commence removing their papers in the coming autumn.

THE fallacy of municipal trading being profitable to the inhabitants has reached Italy, which was always favourable to the growth of economical experiments. It does not appear the new system is more advantageous to the people of the South than to those of northern climes. Palermo, like most Italian towns, was in financial difficulties, and it was imagined that by purchasing gas works and manufacturing gas the debts would soon be repaid. It appeared before long that the municipality could not hope to secure any immediate financial advantage from the gas works and that the people were exceedingly dissatisfied with the gas supplied to them. Many of the clients found their accounts for gas consumption doubled, whilst the lighting and the heating power had decreased enormously. Other experiments which were tried in Palermo have not been

more successful. Several civic councils believed that the most abundant source of profit would be found in colossal bakeries. People can if necessary dispense with gas, but bread is an indispensable commodity. In Palermo the King of ITALY has laid the foundation of a municipal mill, tenders have been invited for machinery, but municipal bread is not forthcoming. In Catania bakeries were established without authority, and in four years the inhabitants have by these means increased the municipal debt to the extent of 17,000*l*. Other instances could be cited, but the belief in trading conducted by amateurs continues to be ineradicable.

THE indifference to the works of J. B. CHARDIN which prevailed for many years in Europe, including France, the painter's own country, is suggested when we find that besides the *Fontaine*, which was purchased in 1898, there is only a small study of still life by the painter in the National Gallery. In the eighteenth century FREDERICK THE GREAT and other royal connoisseurs were able to appreciate his homely scenes, and if those works were now to be sold it would be found there could have been no better investments. An exhibition of CHARDIN'S works is about to be held in Paris in order to obtain funds for various charities, and it is anticipated that the enthusiasm which will be aroused by the sight of the pictures, several of which will come from foreign courts, will be atonement for the long neglect in which such charming works were suffered to remain. At a time when so many painters were producing pseudo-heroic and historic scenes CHARDIN was satisfied to take scenes from the everyday life of the bourgeoisie for his subjects. He lived in Paris from 1699 to 1779, and until his last days he continued to work. It must be owned the contemporary painters recognised his extraordinary ability, and DIDEROT declared him to be the first colourist of the time.

If the Germans can succeed in their enterprise of reclaiming the Campagna di Roma, it will be a victory which will give them a still higher place in Europe. CHARLES DICKENS did not exaggerate when he described it as the fittest burial-ground for the Dead City:—"So sad, so quiet, so sullen; so secret in its covering up of great masses of ruin and hiding them; so like the waste places into which the men possessed with devils used to go and howl and rend themselves in the old days of Jerusalem." The Campagna has an area of about 1,400 square miles, and the formation is mainly volcanic. At one time a large number of people lived on it. But when, in the early days of the Roman Empire, the nobles were allowed to divide the territory into immense estates, ruin seized it. Under the Popes many efforts were made to reclaim the Campagna, and in consequence parts were utilised without much danger. But the great plain requires to be treated as a whole and that was a task which was impossible in any of the preceding ages. It remains to be seen whether the German syndicate will be more successful than the Emperors and Popes who attempted to grapple with the difficulty. The plans prepared by Colonel DONATH, an engineer officer, propose the excavation of a connected series of water-courses which will all trend towards the sea. There are already some rivers, but they are not sufficiently looked after, and the obstructed courses overflow. The soil is not absorbent, and in consequence marshes are formed which become a perennial source of miasma. The works of the Panama Canal appear to be easy in comparison with those required for the reclamation of the Roman Campagna. If the aim of the projectors could be accomplished not only would an immense area of cultivated land be produced, but Rome would enter on a new historical period for people could live there without apprehension of the dangers which centuries of neglect have created, and in that way unanticipated prosperity would follow for the ancient city.

ILLUSTRATIONS.

WYPHURST, CRANLEIGH, SURREY.

THIS illustration shows alterations and large additions to be made to Wyphurst, near Cranleigh, or Mr. C. E. H. CHADWYCK HEALEY, C.B., K.C. The old buildings are shown in black on plans and the new buildings in hatching. The corridor leading past library and billiard-room is shut off from lavatory back stairs and servants' quarters by swing doors beyond billiard-room door, which are not shown on the plan on drawing. The whole of the buildings to the left from and including entrance tower are new, and are joined up with existing buildings by half-timbered work. The facings are of thin red bricks with patterns in vitrified headers, and all mullioned windows and dressing in Portland stone; roofs tiled. The hall is oak panelled, with gallery at end and enriched elliptical coved ceiling. Mr. REGINALD BLOMFIELD, A.R.A., New Court, Temple, is the architect.

WOLDINGHAM DENE, SURREY.

THIS house, with lodge, coachman's house, stabling, &c., was built for Mr. HENRY GAMMAN. The materials used in the elevations are red brick, rough-cast of a deep yellow colour, with red tile roofs. The back wall of the house is built against the hillside, which was excavated to form a site for the house. The steps from drive to lawn are of concrete and red terra-cotta. The architect is Mr. F. T. W. GOLDSMITH, R.I.B.A., 1 Verulam Buildings, Gray's Inn, W.C.

MADAME BERGMAN OSTERBERG'S PHYSICAL TRAINING COLLEGE, DARTFORD HEATH.

THE dining-hall forms part of the recent extensive additions to this well-known college. Our illustration is from a drawing exhibited in last year's Royal Academy. The architect is Mr. F. T. W. GOLDSMITH, R.I.B.A., 1 Verulam Buildings, Gray's Inn, W.C.

PROPOSED RESIDENCE, GALICIA, AUSTRIA.

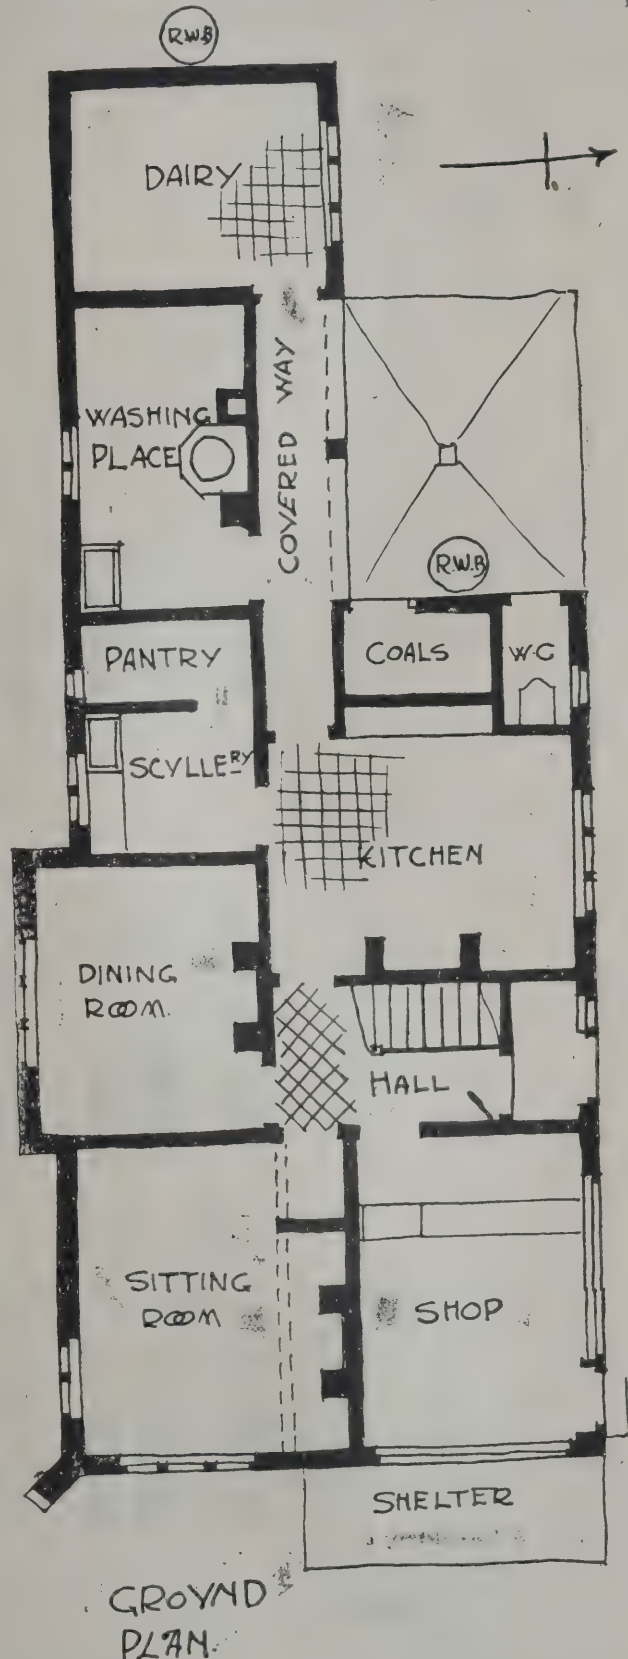

THE site is now being prepared for this house in the centre of a very large estate, covering about 5,000 acres, in Galicia, and a circuitous approach drive is being constructed partly through a forest up to the site, which has an altitude of about 1,200 feet. Magnificent and extensive views will be obtained from the terraces and balconies facing the terrace, the horizon in front being outlined by the distant mountains of Russia. It is proposed to construct the walls of the lower storey and gables with local stone quarried on the estate, and the upper storey with half-timber work formed of solid oak framing, filled in between with 3-inch Mack slabs and cement rendered outside, and the inside lined with 2-inch slabs and plastered, forming a fireproof half-timbered construction. The floors and partitions also will be formed of fireproof slabs, and in fact the whole building would be of fireproof construction. The roof is to be covered with tiles made upon the estate. Owing to the rigours of the winter season all the outside windows will be double, the inner lights folding back against deeply-recessed jambs. All the principal reception-rooms are to be connected by sliding doors, so that when open a vista may be obtained the whole length of the house into the winter gardens. The servants' quarters, kitchen and offices could be entirely isolated, according to the usual custom in the country, and connected to the house by means of a corridor. Each of the principal bedrooms will be provided with a dressing-room, bath-room and lavatory adjoining, and open out into the balcony. It is proposed to heat the entire house by hot-water radiators, in addition to the open fires, in place of the large independent glazed-ware stoves for burning wood and coal generally in use in the country. Some of these are 5 feet to 6 feet square, and reach nearly to the ceiling. The architects are Messrs. CLARE & ROSS, 1 West

Street, Finsbury Circus, E.C., and Westcliff-on-Sea, and the building will be erected by the different mechanics employed on the estate.

NEW PREMISES FOR THE SCOTTISH PROVIDENT INSTITUTION, LOMBARD STREET, E.C.

HOUSE AND DAIRY AT PORTISHEAD, SOMERSETSHIRE.

THIS work has recently been completed for Mr. GEO. TIPPETT. The building is situated in the village High Street, and is kept back some 35 feet from the road. The external walls are of 9-inch brickwork,

cement rough-cast. The plinth, heads and sills to windows, &c., are of blue vitrified bricks. The roofs are covered with varied Broseley tiles, sombre reds and brown-greens predominating. The external wood beams are painted green and the sashes white.

Internally the work is combed in two colours, and the woodwork adjoining hall and staircase is stained brown, finished with a slight gloss resembling a beeswax polish. The doors have black iron rim dead locks and Norfolk thumb latches. Excepting the sitting and dining-rooms the whole of the ground floor is tiled. The contract was entrusted to Mr. W. A. GREEN, of Clevedon, who has carried out the work to the entire satisfaction of the architects, Messrs. RODWAY & DENING, Scottish Widows' Fund Buildings, Bristol.

THE GEORGE, GLASTONBURY.

THIS is a well-known example of a domestic building in the Perpendicular style. It stands in the main street, in close proximity to the market-place and the abbey, the pilgrims to which used formerly to stay there. It has been little altered since it was first erected, with the exception of some back additions, which have been built to provide more accommodation.

GEORGE INN, GLASTONBURY.

[Drawn by W. Eaton, A.R.A.]

OLD POSTERN, LENDAL BRIDGE, YORK. [Drawn by W. Eaton, A.R.I.B.A.]

ENTRANCE FRONT, BELFIELD HALL. [Drawn by W. Eaton, A.R.I.B.A.]

OLD POSTERN, LENDAL BRIDGE.

THE old posterns of York are very picturesque in appearance, with their grey stone walls and red tiled roofs. There are but few now remaining, but the one shown in the sketch is one of the best, and was once used as the ferry-house before Lendal Bridge was built.

BELFIELD HALL.

BELFIELD HALL, which lies on the outskirts of Rochdale, is one of the few old halls in Lancashire which are built on the quadrangular plan. It adjoins the ancient village of Newbold.

The walls are constructed of stone in long thin courses, well bonded at the angles with ashlar quoins of large size, which gives the work the appearance of great strength and solidity. The hall was built at various dates, but chiefly during the reigns of HENRY VIII. and JAMES I. The ancient banqueting-hall has windows of enormous size, with sixteen lights in width. The buildings have been greatly altered to suit modern requirements, and some of the old rooms have been divided by brick walls and are now used as cottages.

PALLADIO'S WORKS AT VICENZA.

BUILDINGS designed by Andrea Palladio are to be found in several of the Italian cities and imitations of them in most parts of the world. But as a native of Vicenza he must have preferred that city, and the people allowed him more opportunities for building than at first sight appeared necessary. He returned there after a long course of travel, when he was in his twenty-ninth year, that is in 1547.

After so many years it is not to be expected that they could escape scathless from decay. Stucco was largely employed by Palladio, and in the numerous places where it has been removed the materials exposed are not always pleasing. But with the aid of imagination and the exercise of the virtue of making allowance for the effects of time, the buildings can be restored to a sufficient extent to enable a modern architect to appreciate their original qualities. The most important among them are the following.

The first building which was entrusted to him without having any coadjutor was the Gothic "Basilica," or Palazzo della Regione, which required adaptation. The columns of the tiers of the loggie are independent of the real or apparent strength of the edifice, and Palladio intended they should be so, for he has made the entablatures break round them. Had the architrave been continued in a straight line the columns would have become essential, and the great space between them would have produced an appearance of debility. The great coved leaden roof is not his fault, but as the point of sight is near, it is never so offensive in reality as it appears in the published elevations. Internally, the lower part is a market, the upper a great hall, which is not handsome. Each intercolumniation of Palladio is opposed to two arches of the original work. He would probably have produced a finer building if he had followed the old plan, but the present building forms a more singular disposition, and suggests what may be done when the spaces are large. The fame of his Basilica was so extended he was summoned to Rome to advise on the subject of St. Peter's, but the death of the Pope prevented the employment of Palladio. He returned to Vicenza in more esteem, and the citizens eagerly sought for his plans. Several palaces were undertaken.

The composition of the front of the Palazzo Capitanale, if completed, would have exhibited a range of eight half columns, comprehending two storeys in height. The openings of the lower storey are large arches, including almost the whole intercolumniation. Above the order is an attic. The effect is rich and magnificent, partly from the solidity and partly from the bold relief of the parts. On examination one cannot but severely condemn the cutting the architrave by the windows, not merely judging by rule, but by the effect. In its present state the brick columns, the stucco of which is half peeled off, have a forlorn and desolate appearance, yet the colouring thus produced is not bad; what displeases is merely the associated character of poverty and ruin. At the end is an elegant doorway ornamented with a smaller order.

The fragment known as Fabbrica Conte Porto al Castello is by some attributed to Palladio, by others Scamozzi, but the latter disclaimed it. Whoever was the architect, we may certainly pronounce it a noble design, although a very small part has been executed and that fragment is nearly in ruins. It would have consisted of a range of Composite columns placed on high detached pedestals and these on high double plinths. The lower range of windows reaches to the top of the pedestal. The second range, in the spaces between the columns, is much larger than the others. The upper windows are in the frieze. These latter have certainly a bad appearance, and the situation of the lower range is not free from blame; but in the cases, where the order is merely ornamental, their want of perfect correspondence with the apparent internal work of less consequence than might be imagined.

The architect of the Palazzo Tiene al Castello is said to have been the proprietor, Count Marc Antonio Tiene, the contemporary and friend of Palladio, from whom, I doubt, he has largely borrowed. Scamozzi seems to have added parts, but the building has an incomplete appearance. It consists of two orders, Corinthian and Composite, and an attic. The lower order is partly rusticated, and an impost moulding contracts the heads of the windows, which are square; but the thin flat arch over them, the sun panel and then another thin flat arch are objectionable. The upper windows are smaller at top than at bottom, but the diminution is slight; altogether the building is beautiful. The back consists of an open colonnade of two orders, closed at each end; the middle intercolumniation is wider than the others, and has some masonry and an arch within it; this variation seems to be introduced merely to spoil the composition. The front has eight columns in each storey, the back ten.

A triumphal arch before a long covered arcade leads to the church of Sta Maria del Monte. This arch is simple and elegant, imitated in some degree from that of Titus in Rome. It is crowned with a ridiculous little lion, and the angels represented on the spandrels have too much projection; but these are not essential to the architecture. The gallery is remarkable for nothing but its length, which is 2,145 feet, and for its 180 columns, but no ingenuity is played in overcoming the ill effects of sloping architecture.

The renowned Rotonda, or Villa Capra, imitated at Chiswick by Lord Burlington, is certainly Palladio's design, and must have been nearly completed by him, though Scamozzi lays claim to the honour of terminating it with some alteration. What this alteration was is not known. We may attribute to him the internal cornices of doorways, chimneys, &c., which are heavy and inharmonious. Although outside the city it partakes of the desolate condition of everything at Vicenza. Internally it is admirable, but it looks small, even more so than it really is. This is probably owing to the preposterously massive ornaments about the doors. The rooms form one suite of apartments, few of which are intended for bedrooms. It would be difficult to accommodate the design to our climate and manners without spoiling it, even if we should find for it a suitable situation, although the Chiswick attempt is not the only one in England.

The Palazzo Valmarana is another incomplete work adapted to a difficult site. It is a handsome edifice, but would be more so if the angles were better supported, if the small pilaster and figure over it, instead of the pilaster of the larger order, are displeasing, and the change in the size and number of the windows in the adjoining divisions is equally reprehensible. The mouldings of the lesser order project beyond the pilasters of the larger, and if the panels of sculpture over the lower windows were somewhat narrower, they would have a better shape themselves, and the greater space over them would be an advantage. In other respects the proportions are excellent, and the distribution at once beautiful and uncommon. The total absence of windows in the height of the pedestal is considered to be a great advantage.

The Palazzo Trissino is probably one of the best works of Vincenzo Scamozzi, and it is a noble edifice, though it wants something of that undefinable grace of proportion which we admire in Palladio, and it stands in so narrow a street that one can hardly judge of it fairly. It has a range of narrow windows on the principal floor, with intermediate pilasters doubled at the angles, but the change of design in the middle divisions, the high unmeaning arch of the central part, and the double pilasters separating the centre from the wings, are so many defects. In the ground floor the large central arched opening is too reasonable to displease.

Palladio in his design for the Palazzo Barbarano had seven openings in the range; two more have since been added, and the composition has not been injured, except that the doorway is no longer in the centre. It is overloaded with ornament. The sprawling figures over the pediments of the windows, the husks which run down on each of the openings, and the trophies in the lower storey, ought all to be taken away: with these exceptions in the decorative parts the composition is excellent, and presents in its unbroken entablatures a simplicity not usual in the Palladian architecture. It somehow recalls the banqueting-hall of Inigo Jones.

The Palazzo del Conte Orazio da Porto, now the Casa del Diavolo, was designed by Palladio for a Conte Giuseppe Porto, and great part finished by him, but the whole design has never been completed. There are arches above the windows of the basement, larger than the openings below, and the lines not being continued downwards, they have an unmeaning appearance; and it would be better if the figures and husk ornament, which are added to the middle and extreme windows, were omitted. These are very trifling defects, and for everything else the building is one of the most correct of Palladio's designs.

The outside of the Olympic Theatre having been erected on a contracted and irregular piece of ground, does not claim any attention. In the scene, which is the part most admired, Palladio anticipated the discoveries of the Pompeian theatres. Of course he had the guidance of Vitruvius. It consists of two orders and an attic, has clustered columns and pilasters, and breaks upon breaks, and abounds in figures and bas-reliefs. The finish against the ceiling is low and poor. The author wished apparently to give the appearance of a building terminating in an attic, and meant that the ceiling should entirely disappear; and if the latter were kept of a uniform dead colour, this by candle-light might perhaps have been the case, but the idea has not been preserved, for the ceiling is gilt and painted. In the middle avenue a very considerable effect of distance is obtained; those on each side, opening into the middle, are nearly lost; those of the second openings on the right and left look pretty well from certain points of view; the end ones are failures. It is remarkable that the point of sight is lower than it would be on the lowest seat, which is 3 or 4 feet above the stage. The seats are most inconveniently narrow and nearly as high as they are wide. The colonnade above the seats is beautifully proportioned, but the centre division has been filled up in consequence of want of room, and this is very injurious to its beauty. The row of statues at the top seem in danger of knocking their heads against the ceiling, and offer another proof that this was not intended to be conspicuous; they would be very much in the way of any spectators in the gallery. It must be allowed that Palladio did not witness the construction of the theatre, and he might have introduced some deviations from his plans. Palladio's columns are mostly mere ornaments, but in contemplating his buildings it is impossible to feel this to be a fault. The sculpture which loads the pediments of the windows is certainly ill placed, and still worse is the little panel of bas-relief so frequently introduced into the lower windows, dividing what ought to be one solid mass into two miserably weak arches. What is it, then, that pleases so much and so universally in the works of this artist? It seems to consist entirely in a certain justness of proportion, with which he has distributed all the parts of his architecture, the basement being neither too high nor too low for the order above it, the windows of the right size and well spaced, and all the parts and proportions suited to one another. The same excellence is found in his orders and the relation of the columns, capitals, entablatures, &c. He has not adopted the theoretical rules of another, but has drawn them all from what he felt to be pleasing to himself and suited to his own style of art; but they are not good when united to a more solid and less ornamental manner.

It is impossible to deny that Palladio's works abound in defects and solecisms that would hardly be tolerated in anyone else. Not only are there engaged columns and matters of that sort belonging to the system itself, but dryness and littleness of manner frequently resulting from an order being adapted only to a single floor of a building. One consequence of the latter is that, notwithstanding so much stress is laid upon proportions, the due proportion that should be observed between the columns and the windows is almost lost sight of. There are also such errors as windows cutting into architraves, windows within friezes, doors lower than windows, figures on the raking cornices

of window pediments, naked and dressed windows in the same composition, &c. Other faults can be pointed out which, if they do not run counter to rule, are yet sins against beauty and good taste, such as ugly balusters, mean attics, offensively wide intercolumns, heavy pediments, meagre entablatures and columns, particularly in the Ionic order, and above all a dryness, mannerism and monotony of detail. As regards Palladio himself, there may be much excuse for his errors, but certainly none for the prejudices of those who would now insist upon our admiring his works without qualification, more particularly as nothing is easier than for a modern architect to avoid his faults, and even to improve upon his beauties.

J. B. LASSUS ON LONDON.

IN any history of French architecture during the first half of the nineteenth century the name of Jean-Baptiste-Antoine Lassus must be prominent. Born in 1807 and dying in 1857, his career was brief, but within it he was allowed to produce excellent work. Apart from his buildings, he also rendered a service to his generation, for it was by his aid the sketch book of Villard de Honnecourt was produced. His first work was the restoration of the old church of St. Severin in Paris. Having exhibited a design for the restoration of the beautiful Sainte-Chapelle, he was entrusted, along with Duban, with that important work. After a time he had sole charge. He likewise co-operated with Viollet-le-Duc in the restoration of the cathedral of Notre-Dame. Lassus became official architect of the dioceses of Le Mans and Chartres, as well as Paris. The fine church of St. John Baptist at Belleville was erected from his designs. The list of his works would be long, and we have mentioned a few to suggest the competency of Lassus to criticise English architecture when he visited London in 1851, and afterwards wrote the following epistle to a friend:—

My dear Sir,—I take great credit for having waited till now before I imparted to you the impressions of all sorts which crowded upon us during our short stay in England.

To us Frenchmen, the colossal aspect of your capital, the infinite number of streets, the hasty movements of people and of carriages, stirring in all directions, all form a picture so immense and so animated that it is really enough to make one giddy, and it is only at the end of some days that the mind can be settled, and in a condition to judge. This was the general sentiment of our whole party. We had left Paris knowing perfectly well that we were going to visit the greatest capital of the world, and, nevertheless, the reality far surpassed all that we had been able to imagine.

Forced to renounce the pleasure of seeing a friend, I took at once the course of tearing up all my letters of recommendation, in order to profit by every instant of which I could dispose in rambling about the town, going by chance without any other guide than the modest map *de circonstance* of Mr. B. T. Wilme. This method of seeing a town is certainly not the quickest, but it is full of charms, for surprise plays a part in it which piques curiosity, and gives continual life to one's attention.

I was always accompanied in these walks by my two friends, Paul Durand and the Baron de Guillermy—Paul Durand, the most perfect fanatic on Greek art whom I know; and Guillermy, the witty and learned archæologist, with whom you are acquainted. Though we were only eight days in London, yet I shall never forget the pleasure I felt during that week. It is unnecessary to say that our excursions were not made in silence; between Frenchmen the thing is an impossibility. You will also well understand, my dear sir, that we were very rarely of the same opinion, otherwise the excursion might have been tiresome.

Entrusted with the functions of guide, with the help of that famous map which I have already mentioned, M. de Guillermy assumed the part of passionate admirer. He praised all, he applauded all and was never tired of admiring. Durand only thought of the British Museum and the bas-reliefs of the Parthenon. As to me, being unable to admit without contest the exaggerations of Guillermy, I was naturally drawn to criticise, and I much fear that I have still preserved a tolerably large share of my travelling habits. I hope, however, that you will excuse the criticisms in favour of the end, and that your national pride will not be hurt by the frankness of my observations. You will see in them, I am sure, only the artist earnestly seeking the truth; besides, on many of the points, you will doubtless be of my opinion.

It is evident that you cannot approve of certain modern churches and chapels which resemble much, as to their merit at least, those constructed in France and confided to architects ignorant even of the principles of Gothic art. I confess to you that I find these bad imitations a thousand times more detestable than those which were given to us as reminiscences of Grecian and Roman art.

This opinion I back by more than one argument. The first is, that Grecian and Roman art are both of them composed of elements more simple and far less in number than Gothic art, and in them the proportions and the principles of the orders have been reduced to rule and there remained fixed by absolute standards, from which it is impossible to depart. The most incapable mason has but to take his formulary and it is then perfectly competent to him to raise a Doric, Ionic, or Corinthian portico, as he may wish.

In the Gothic art the elements are infinite, and besides, every monument presents the greatest variety in the manner of combining them; in short, most happily there exists no formulary which enables ignorant men to make something like columns, without value, it is true, but which at least present nothing very shocking. In proof, look at those who try to make imitations of Gothic art without having seriously studied its principles. They imagine that there is nothing more easy, that it is enough to group bundles of shafts to make pointed openings; and, above all, to multiply the details indefinitely, to ornament, and to cut out. They are entirely ignorant that the productions of this art are subjected to principles and rules as absolute, as positive as those of that of Greece and Rome. Nay, more, they go so far as to deny the existence of those laws, without which art cannot exist.

You see I keep to my character of critic, and I do not flatter myself in being tender to your modern buildings, but in truth I sacrifice in return to you a great part of ours, to which the same reproaches may be justly addressed.

Du reste, the fault does not lie precisely at the door of living artists; the evil dates from further back, and with us at least it is to the radically vicious instructions of the schools that we must attribute it, and there it is that a reform must first be made. You cannot imagine how difficult it is to shake off those bands with which one finds oneself embarrassed on leaving the school. Vigorous and long efforts are indeed needed to disengage oneself from all the accumulated shackles by real instruction.

You may perhaps think that I exaggerate. I assure you, however, it is far otherwise. I am persuaded that he who wishes to become an architect in earnest cannot attain his end, but on the condition of first forgetting all that he has learnt at the *Ecole des Beaux-Arts* and of learning afterwards a multitude of necessary things which are not taught there. Is it the fault of the pupils if their judgment is ruined? Evidently not; it all falls back upon the professors, and the worst part of it is that themselves having no conviction of the truth of those false principles which they teach, they utter anathemas against those who only dare to doubt their infallibility.

You remember that famous crusade attempted about two years ago by the Academy, in order to stifle at the birth the taste for Gothic art. Unhappily for the erudite body its appeal had no echo, and all the efforts of its learned supporters have had no other results than to provoke a tolerably large number of replies, in which the Academy found itself very ungently handled.

Evidently, whatever they may now do, the movement has begun, and the Academy knows well that it is impossible for it to stop it, only to unite all its efforts to cripple it, but the stream is stronger, and in spite of all obstacles, the influence of archaeological studies makes itself already felt even in the compositions of the pupils of the school.

I have been struck with it this year; I, who do not usually frequent the exhibitions of the *Ecole des Beaux-Arts*, was very far from expecting what I saw on going by chance to visit the exhibition of the great prizes. Not that I approved of the subjects exhibited—much the contrary—and I went so far as to think that it was difficult to answer worse to the programme, but here again it was the professors on whom the fault should be laid. The subject, in short, was a hospital of refuge to be built upon mountains, like the Mont St. Bernard. Now it is certain that if the pupils had made reasonable plans, with closed cloisters sheltered from the wind and snow, they would have been rejected. Instead of this they had drawn long ranges of colonnades, vast galleries open to all winds, and the satisfied Academy had given the palm to the most impos-

sible plan. However (and this was the subject of my surprise), in one of them, that which obtained the second great prize, the tower of the chapel was surmounted by a real Gothic spire, of a pyramidal form, with quatrefoil openings, planted, one knows not how, on a basement composed of antique elements. The effect was truly detestable; but, nevertheless, there was in it a character of boldness which would have cost its author immediate expulsion from the prize list only four or five years ago.

You see we advance; and in spite of the efforts of the Academy, the taste for Gothic art develops itself more and more. The resistance of the academicians and their disciples does not frighten me at all; and I confess frankly to you that what appears to me much more to be dreaded is the precipitation with which people rush into the execution of certain so-called Gothic monuments, which have nothing of Gothic in them but the name. In fact, as I have already said, I prefer a hundred times the bad imitations of the antique; these at least do not hurt our cause at all, quite the reverse; whilst a bad Gothic construction furnishes very dangerous weapons with which to oppose the principles which we defend, and I think that in this case we ought to be the first to repudiate them, and refuse them any credit.

The weight of these arguments will, I hope, explain to you the severity of my judgment on your new Houses of Parliament. Besides their author, raised by public opinion to the level of the first architects of ancient and modern times, occupies too high a position for him to care for the opinion and the criticism of a foreigner.

I am the first to recognise the impression of grandeur produced by this immense building, of which the feet are bathed in the Thames, and the summit, cut into a thousand pinnacles, stands out against the clouds and fogs which brood over the great city.

Seen from Westminster Bridge in a fine moonlight, or under certain effects of clouds, one may say that its aspect is magical. It is a fairy palace, a marvel of the Thousand and One Nights.

But, and here you will be greatly astonished, to my eyes this colossal monument does not appear to be conceived according to the fundamental principles of Gothic art. Nay, more, I find that it resembles much rather the appearance and disposition of the antique. Symmetry reigns there in the most despotic, the most absolute manner—all the arcades, all the windows, all the pinnacles, all the niches—in short, all the details—are identically the same in the façade of the building. It is like the Roman column and capital, repeated indefinitely on the four faces of the temple; and if I did not fear to be too severe, I should say that this disposition shows the same Classic purity which characterises the academic plans.

Setting aside the enormous differences of dimensions and of style, the Houses of Parliament appear to me to be open to the same criticisms as our *Hôtel de Ville*, recently enlarged and completed at great expense.

In these two monuments we find the same absence of the real. In the *Hôtel de Ville* the four fronts are alike, and, nevertheless, that of the quay is destined for the great apartments and that opposite for offices; from which it results that the grand arcades, perfectly suitable for lighting the apartments of state, are found to be divided by a floor on the side of the wing destined for the service of administration; and the result is there are offices lighted from below, and in which it is impossible to see clearly in broad daylight.

It is nearly the same thing in the Houses of Parliament—the great internal dispositions are not expressed in the façade; and if you place a stranger before this immense monument, it would be completely impossible for him to guess its destination. It is like the Madeleine and the Chamber of Deputies—ask one who finds himself for the first time on the Place Louis XV. which of these two buildings is a church, and there is no doubt that these two lines of columns, crowned with similar pediments, would place him in the greatest embarrassment.

When I seek to imagine how the architects of the Middle Ages would have dealt with the composition of a palace to serve for the meeting of two such powers as the Houses of Lords and Commons, it appears to me that they would have been occupied, above all, with the idea of expressing strongly in the façade the two great halls destined for those assemblies. I do not know if I am mistaken, but I think also that they would have given more importance to the Upper House; and I am convinced that the aspect of the monument would have presented an infinite variety in accordance with the different uses to which it was destined.

I know well that you will tell me of the two towers ; but, first, what do these two enormous constructions mean ? what is the reason of their existence ? Are they towers of defence, or belfries ?—neither the one nor the other ; and I see, in truth, no argument of real importance which can justify the existence of these two giants. If they are there to recall the two Houses it would have been much more simple, and, above all, much more real to have expressed them, themselves, openly in the façade, instead of drowning them under an ornamentation, in the midst of which it is impossible to suspect them. But I must stop, and I really fear that I have gone too far. Nevertheless, you see that if I criticise the Houses of Parliament, I hold as cheap several of the monuments of Paris, which are generally much admired ; and I hope you will only see in this the very sincere desire of arriving at the truth.

IRRIGATION IN EGYPT.

THE practice in Egypt in calculating the dimensions of canals and distributaries is to allow per day 1,050 cubic feet of water for each acre to be irrigated. In Lower Egypt the period for lower discharges for 1904 has been taken from May 1 to June 30. The mean volume for the six canals withdrawing from the river at the delta barrages was 1,746,395,000 cubic feet per 24 hours. In addition thereto there were taken from the river by pumps and other means 140,980,000 cubic feet per 24 hours during the same periods. Of this quantity, however, 5,075,000 cubic feet per 24 hours were used in Alexandria and Port Said for domestic purposes. After therefore deducting this latter quantity, we have a total of 1,882,300,000 cubic feet per day diverted from the river for the irrigation of the delta land between Cairo and the sea from May 1 to June 30.

The following crops were irrigated during the period under review in the area in question :—

Rice	141,135 acres.
Other crops	1,299,240 "
	1,440,375 "

Assuming, as is usually done, that rice requires twice the quantity of water that other crops do, the actual quantity of water used from the river per acre per 24 hours would be :—

$$\begin{aligned} &1,882,300,000 \\ & (141,135 \times 2) + 1,299,240 \\ & = \text{cubic foot per acre per day.} \\ & = 1,190. \end{aligned}$$

This figure is higher it will be observed than that used for calculating the canals and distributaries by 140 cubic feet per acre per day.

Reducing these figures to the number of acres which one cubic foot of water per second will irrigate, we have—

$$\begin{aligned} & (141,135 \times 2) + 1,299,240 \\ & 1,882,300,000 \\ & 24 \times 60 \times 60 \\ & = \text{acres per cusec.} \\ & = 73. \end{aligned}$$

In Upper Egypt during the periods of low discharge in 1904 the mean volumes for the Ibrahimiyah and the Sabakhah Canals were 369,182,870 cubic feet, and 72,159,185 cubic feet respectively, or a total between Asyut and Cairo of 441,342,055 cubic feet per 24 hours during the summer of 1904.

The total area of crops under irrigation for the period under review was 344,755 acres for the Ibrahimiyah Canal and 52,359 acres for the Sabakhah Canal, making a total of 397,114 acres. The actual quantity of water used from the river per 24 hours would be—

$$\begin{aligned} & 441,342,055 \\ & 397,114 \\ & = \text{cubic foot per acre per day.} \\ & = 1,111. \end{aligned}$$

This is slightly less than Lower Egypt, but higher than the duty reckoned upon.

Reducing these figures to the number of acres which one cubic foot of water per second will irrigate, we have—

$$\begin{aligned} & 397,114 \\ & 441,342,055 \\ & 24 \times 60 \times 60 \\ & = \text{acres per cusec.} \\ & = 78. \end{aligned}$$

Taking Lower and Upper Egypt together, the duty in acres per cusec is 74.

It must, however, be borne in mind that it is quite ordinary for three crops to be grown during the twelve months where perennial irrigation is in vogue, and the average is two and a half crops. In India it is customary to take credit in the duty from the crops grown per annum rather than the acreage of land. Assuming that this is sound practice in the case of Egypt, in order to bring the duty into the same plane as India and make it possible to compare the one with the other, the 74 acres per cusec for the year must be multiplied by 2.5. The duty per cusec for the crops irrigated would be 185 acres.

SPECIFICATION FOR PAINTS, &c.

THE following suggestions are offered by Mr. R. J. Angel, M.Inst.C.E., in the Journal of the Royal Institute of British Architects. He says :—It is not assumed that the list is by any means exhaustive or complete, but it is submitted for the use of other members, who may find a need for the information.

(Percentages calculated on Original Pigments Undried.)

Turpentine.—Refined, genuine American, free from adulteration (optical rotation not less than + 4 degs. 5 mins. in 100-mm. tube).

Terebine.—Finest. One part of terebine, when mixed with sixteen parts of linseed oil and spread in a thin layer on a glass plate, and kept at a temperature of 60 degs. Fahr., must dry in eight hours. To contain not less than 10 per cent. metallic oxides.

Varnishes.—All varnishes to be made from the best pure gums and oils, to flow easily, dry lustrous and with a firm coat in eighteen to twenty-four hours.

Driers.—To contain not less than 20 per cent. of lead or manganese preparations.

White Lead.—To contain not less than 25 per cent. or more than 30 per cent. hydrated oxide.

Red Lead.—To contain not more than 3 per cent. of impurities, to be good colour, smooth and free from grit.

Ochre.—Genuine, of good colour and body. Free from barytes and other base mineral.

Burnt Umber.—To contain not less than 45 per cent. oxide of iron and 15 per cent. manganese dioxide. Free from barytes or other base mineral. To be fine, well ground and free from grit.

Purple Brown.—Containing not less than 60 per cent. oxide of iron, good colour and free from grit.

Ultramarine Blue.—Containing not less than 40 to 45 per cent. silica, 20 to 25 per cent. aluminium oxide, 9 to 10 per cent. sulphur. To be fine and free from gritty matter.

Vermilion.—Pure sulphide of mercury ; ash not to exceed 0.5 per cent.

Venetian Red.—Containing not less than 25 to 30 per cent. oxide of iron. Free from barytes or other base mineral. Fine and free from grit.

Indian Red.—To contain not less than 97 per cent. oxide of iron. Strong in colour and well ground.

Sienna Burnt.—Containing not less than 70 per cent. oxide of iron. Fine, good colour and free from grit.

Sienna Raw.—Containing not less than 60 per cent. oxide of iron. Fine, good colour and free from grit.

Chrome, Lemon and Orange.—Pure commercial, of a fine colour.

Brunswick Green.—To contain not less than 15 per cent. lead chromate, well ground and good body.

Zinc White.—Pure zinc oxide, well made, free from grit.

Lamp Black.—Containing 95 per cent. carbon, mineral matter not to exceed 3 per cent. Free from unburnt oil.

Vegetable Black.—Containing 97 per cent. carbon.

Prussian Blue.—To contain not less than 40 per cent. oxide of iron. Ash must be soluble in dilute acid. Fine and free from grit.

Bronze Green.—To contain not less than 10 per cent. lead chromate.

Emerald Green.—To contain not less than 28 to 30 per cent. copper oxide and 55 to 56 arsenious oxide.

English Gold Leaf (best).—Unadulterated with any foreign material, and must be supplied to whatever tint is required. Twenty-five leaves per book.

Red Oxide.—Containing not less than 65 per cent. oxide of iron. Fine and bright in colour.

The architect will submit such material as may be necessary, whether included in the schedule or not, to an analyst (to be chosen by the architect) for analysis, and

should the report of the analyst indicate that the materials are not equal to the quality or standard specified or ordered, or are not genuine, or do not conform to the specification in any way, the cost of the analysis will be deducted from any moneys due or becoming due to the contractor, and the contractor must, on receiving notice from the architect, remove the rejected articles and supply others equal to the standard specified within two days.

Samples of the materials will be taken on the site, and when in the condition for use on the building, the contractor or his representative will be advised that samples are about to be taken in order that he may be present or be represented. The samples will be divided into three parts, to be then and there separated, and each part will be marked, sealed, or fastened up in such manner as its nature will permit. One part will be delivered to the contractor or his representative, one part will be retained for future comparison, and the third part will be submitted to the analyst. If the contractor or his representative fail to be present, no question will be allowed to be raised afterwards as to the authenticity of the samples should the analysis prove unfavourable.

Bath Stone.

SIR,—My attention has been called to a paragraph, for which I am personally responsible, in the fifth volume of "Modern Buildings," to the effect that all the Bath stone quarries "are owned by the same great combine." This, it appears, is not correct, as there are three large quarries producing stone of the best quality in other ownership, namely, Messrs. Marsh, Son & Gibbs, Ltd., of Hartham Park Quarries; Messrs. Yockney & Co., of the well-known Corsham Down Quarries; the Corsham Quarrying Company, Ridge Quarry, adjoining Monk's Park Estate, and several smaller firms.

I should be exceedingly sorry if any statement of mine, however inadvertently inaccurate, were harmful to the interests of others, as it seems this is likely to be, and should be obliged if you will kindly allow this letter of explanation to appear in correction thereof.—Yours, &c.,

(Signed) G. A. T. MIDDLETON.

19 Craven Street, Strand, London, W.C.:

May 17, 1907.

Acoustics of Churches.

SIR,—Could any of your readers inform me of the best way to improve the acoustic properties of a Gothic church with a high roof? It would be a further favour if they would state where the plan referred to was in operation, so that I and my fellow office-bearers might see it.—Yours truly,

INQUIRER.

GENERAL.

The Glasgow Corporation have approved of a recommendation by the committee dealing with the Corporation's proposed building scheme at Riddrie, to allot premiums for plans to the following architects:—1st (75*l.*), Mr. J. B. Brodie, 141 West George Street; 2nd (50*l.*), Mr. John F. Fairweather, 136 Wellington Street; 3rd (25*l.*), Mr. Richard Henderson, 116 Hope Street.

Mr. Charles Tyson Yerkes, of Chicago, the organiser of street railways, and who was mainly instrumental in the electrification of the District Railway, has bequeathed his residence at the corner of Fifth Avenue, to New York, with the paintings, bronzes, works of art, bric-à-brac, &c., and 750,000 dols. is to be applied to the purpose of forming an art gallery. This bequest will hold good on the death of his wife.

The Annual Report of the Church Building Society stated that the past history of the Society showed that it had been instrumental in aiding in the erection of no less than 2,507 additional new churches, and in assisting in rebuilding, enlarging or otherwise improving the accommodation in 6,477 other churches. By these means more than 2,000,000 additional seats had been secured, by far the greater part of which were for the free use of the parishioners.

Mr. James Hardiman has been appointed county surveyor by the Galway County Council.

Commandatore Boni will lecture in the Sedgwick Museum, Cambridge, on Monday, May 27, at 5 P.M., on "The Forum at Rome." The lecture will be delivered in English, and will be illustrated by lantern slides. The admission will be free.

Mr. G. Denholm Armour, the *Punch* artist, will on Saturday next and during the four following weeks hold an exhibition at the Leicester Galleries, Leicester Square, of his drawings in colour and line of "Hunting, and other Sports." Mr. Armour's first exhibition was held in these galleries nearly two and a half years ago, and met with much appreciation from sportsmen and art lovers alike. The present collection will contain some rather more important works, and will include a few oil-paintings.

A Project for the Haussmannising of the ancient streets of Strasburg is now under consideration by the Municipal Council of the city.

The French President has authorised the Minister of Public Instruction and Fine Arts to accept the archaeological collections of the Baron de Baye, which represent researches in the district of Champagne during a quarter of a century. The objects will be placed in the Louvre.

St. Andrew's Town Church, Glasgow, is to be restored at an estimated cost of 21,300*l.*, under the direction of Mr. Macgregor Chalmers.

The Late James Clarke Hook, R.A., has left property valued at 112,108*l.*

The Chelsea Borough Council have invited six architects to submit a sketch and an estimate for building the proposed workmen's dwellings on a site given by Lord Cadogan.

The Dean and Chapter of Canterbury find that the cathedral is in need of further extensive reparation. A sum of 14,000*l.* has been expended on the central tower and some other parts of the structure, but the repairs of the north-west and south-west towers and the renewal of the south transept gable and pinnacles of the nave will cost nearly 18,000*l.* more.

The Trustees of Silcoates School, Wakefield, having decided to build a new school, invited eleven architects to send in competitive plans. Mr. John Ely, of Manchester, acted as assessor. He placed first the designs prepared by Messrs. Oliver & Dodgshun, of Carlisle and Leeds. The estimated cost of the new building is upwards of 9,000*l.*, and the work is to be proceeded with at once.

The Value of the property of the late Miss Eleanor Harriet Duncombe, second daughter of the late Dean of York, has been proved at 37,922*l.* 5*s.* 3*d.* gross. Testatrix left 2,000*l.* to her brother, her house and furniture to another brother, and 5,000*l.* between her cousins, Lucy and Evelyn Whitmore. The residue of her property she bequeathed to the Fabric Fund of York Minster.

At the Annual Meeting of the Manchester Society of Architects the following officers were elected:—President, Mr. Paul Ogden; vice-presidents, Messrs. Edward Hewitt and P. S. Worthington; hon. secretary and treasurer, Mr. Isaac Taylor.

Mr. Sinclair, the Secretary for Scotland, answering a question put upon the House of Commons notice paper, states:—The Local Government Board inform me that in February last it was found that eighteen Scotch burghs had bacteriological systems of sewage purification already in operation. In seven cases systems were being laid down, and in the case of fourteen burghs schemes were under consideration.

The Estates Committee of the Birmingham City Council state that the actual income of the department for the year 1906-7 was 82,066*l.* 3*s.* 1*d.*, including rents 62,030*l.* 19*s.* 3*d.* and income from rates 20,000*l.* The expenditure amounted to 86,191*l.* 7*s.* 6*d.*, leaving a deficiency of 4,125*l.* 4*s.* 5*d.* The deficiency is attributable to a change of policy with regard to the upkeep of the property in charge of the committee. The whole of this property is held pending offers being received to take the land forming the sites upon building leases, and only necessary repairs have in the past been carried out. All the property has been in existence for many years, and the committee have felt that it would be unwise to count upon letting an appreciable area of land for some time, and that they should therefore place the property in a structural and substantial state of repair. This course has been adopted and carried through in the greater part of the property, and the work will be continued until completed.

DENCE. ■ ■ ■
FOR COUNT DE CMEWOZ.

"INK PHOTO SPRAGUE & CO. LTD. 4 & 5 LAST HARDING STREET FETTER LANE E.C.

The Architect.

THE WEEK.

HERE are several interesting objects in the Arts and Crafts Exhibition in the Builders' Exchange, Birmingham, which will remain open until June 20. There are memorials of various worthies whose names are associated with Birmingham, including WATT, MURKIN, BOULTON, BRINDLEY and others. There is a copy of the original design for the town hall by Messrs. HANSOM & WELCH. It has a history. When the design was adopted the committee entered into a contract with a firm of builders who were introduced by the architects. As the price for which they offered to do the work seemed to be too low the committee insisted on the architects becoming security for the contractors. As was to be expected, the architects found themselves in financial difficulties. A Liverpool architect then came forward to supersede Messrs. HANSOM & WELCH. The result was that by winning the competition the architects lost not only three years' labour, but in addition several thousands of pounds. The modern arts and crafts section is most attractive. There are tiles and mosaics by the Art Pavements and Decorations, Ltd.; metalwork by Messrs. CARTLAND & SON, LTD., which manifests how well an old-established firm can realise modern designs; mural tablets, panels, tiles, by Messrs. WOOLLISS & SON, LTD.; beautiful examples of bookbindings and works in the precious metals by the Guild of Handicraft, Ltd., which are worthy to stand in palaces.

A CURIOUS case under the Workmen's Compensation Act has been heard by the Recorder in Dublin. A year ago a man who was employed in the erection of the Iveagh Market fell from scaffolding and his head was injured. Compensation was paid to him regularly until the end of the year. The contractors considered he had recovered. But the man declared he was still suffering from rheumatism and gout, which were the results of his fall. Two medical referees examined him. It, as is not unusual, they took different views of the case. It was, however, ascertained that before the accident the man had been in one of the hospitals as a patient who suffered from rheumatism and gout. The Recorder came to the conclusion that the plaintiff had no case, as he had been subject to an earlier time to the complaints. The case was accordingly dismissed on its merits. But the Recorder recommended that the man should appeal to the contractors to provide for him. The Judge was no doubt inspired by benevolence, and similar recommendations are not uncommon in the Irish Courts. But the question must arise whether in justice there is any obligation on the part of the contractor. And there is also the danger that the alternative will increase the number of claims under the Act. If a workman fails as a suitor he will calculate that the Judge's influence will obtain for him a charity equivalent to the amount he sought as compensation.

THE finances of Italy appear to be in a more hopeful state, especially as the revenue exceeds the expenditure. In the house-tax alone there was an increase of 44,000,000 lire during the year 1906-7. Accordingly the Government have proposed to incur fresh extraordinary expenditure on public works amounting to about 40,000,000,000 lire. Of that amount 24,400,000,000 only—the sum required in addition to the 12,000,000,000 already voted to set the railways in order—would be borrowed. The remainder of the 40,000,000,000 would be furnished from future surpluses and from available Treasury funds spread over a considerable number of years. Part would be employed in improving the ports and harbours of the kingdom (1,000,000,000 lire) and in constructing new lines of railway in parts of the country hitherto unprovided

with them, by means of grants up to the annual amount of 220,000,000 lire; 280,000,000 lire would be spent on improving internal navigation; 240,000,000 lire in regulating the upper courses of rivers and in re-afforestation; 1,000,000,000 lire would be allotted to posts and telegraphs and telephonic service, and 200,000,000 lire would form a first endowment of a fund for the fine arts. Provision would also be made for necessary measures for Sardinia and for Rome and for various other requirements, particularly in connection with national culture and social economy. Finally, the Government propose to set on one side and guarantee henceforward a fund of nearly 800,000,000 lire every year to be expressly and solely used for the purpose of reducing and readjusting taxation, as soon as it should be possible to find a safe and equitable solution of this most difficult question. The favourable condition of the finances may explain the desire to undertake such costly works as the exploration of Herculaneum without the aid of foreigners.

SOME British insurance companies suffered by the destruction of buildings at San Francisco. It is now found the German fire insurance and reinsurance companies which were actively engaged in California experienced serious losses and were financially weakened in the course of 1906 as a consequence of the earthquake. Six of the principal German companies had issued insurances to the extent of 49,253,375 dols., or say ten millions sterling. In view of the extensive participation of German insurance companies in California the indemnifications to which they became liable were prodigious. Several companies were prevented by this loss from paying any dividend; others, after the absorption of reserves, were obliged to encroach upon their share capital and then proceed to financial reconstruction, whilst some could only survive the crisis by giving up their independence altogether and amalgamating with stronger companies. Further losses in connection with the disaster at Valparaiso were avoided through the so-called "earthquake clause."

It was lately announced that the restoration of Holyrood Chapel could not be undertaken, because the legacy of Lord LEVEN was applied to other purposes. The subject came before the General Assembly of the Church of Scotland on Monday. The Presbytery of Edinburgh had formally expressed a desire that the object should be accomplished. The Procurator proposed a resolution to the effect that the Assembly regretted "the difficulty which has arisen in connection with the carrying out of the generous and patriotic proposal of the late Earl of LEVEN AND MELVILLE to restore the chapel of Holyrood, and earnestly hope that means may yet be found for accomplishing the object which he had so dearly at heart." It was stated that the 40,000,000 became the absolute property of young children who were only able to appropriate it to themselves. He said that the suggestion of one of the trustees was that they should wait until the chapel crumbled down, preserving meanwhile the old designs exactly, and that when the building had crumbled away they would have a new chapel according to the old design. The Rev. Professor COOPER advocated, from a religious point of view, that they should seek the restoration of the chapel. Holyrood was the only one of the great palaces which was without a chapel. The nave was 6 feet longer than the nave of Glasgow Cathedral, and by roofing it a magnificent interior could be produced. It remains to be seen whether, when so powerful a body as the General Assembly has advocated restoration, the effort will be more successful than those attempted since the legacy became available. Apparently if the work has to be done it will be necessary to obtain special subscriptions. The Holyrood restoration committee are still of opinion that Lord LEVEN's desire will be realised.

THE DUNDEE FEES CASE.

ACTIONS by architects and engineers for the recovery of fees are not uncommon. It is, however, allowable to assume that one of like magnitude to that brought by the trustees of the late WILLIAM MACKISON against the Town Council of Dundee has never been heard in a Scottish Court. Already four or five busy days have been occupied with the evidence, and it is not certain whether plaintiff's case is exhausted. Unless a compromise is arrived at, the case when it is resumed in October may occupy a still longer time.

We have no intention of expressing any opinion which could be considered as anticipating the judgment of Lord GUTHRIE, who is hearing the case in the Court of Session. But as the proceedings possess interest, perhaps a moral, for those who occupy positions as borough engineers and surveyors, it is allowable, by the aid of the reports in the *Dundee Advertiser*, to describe some of the circumstances which, if we are not mistaken, are not unique in character. Officials and town councils are occasionally disposed to avoid the discussion of claims relating to extra services, and therefore, as in the Dundee case, increase the difficulty of arriving at a settlement. The action may also serve as a warning to men occupying similar positions about the risk of undertaking duties which do not properly belong to them.

The late Mr. WILLIAM MACKISON was exactly the type of man to gain the confidence of the inhabitants of a Scottish town. He was as grave in manner as if he felt he was always a dignitary of the Church. There was no doubt he carried out the varied duties of sanitary inspector, surveyor, engineer and architect in Dundee to the satisfaction of the Town Council. But his manifold duties and his dealings with all conditions of men were insufficient to eradicate a natural timidity which is not usual in officials of his class. His duties, or rather their possible consequences, appeared to have him in their grip, and hence it was necessary for him to talk as well as act with the utmost caution. When such a man found himself in an awkward position through his willingness to exercise his own powers and to promote the welfare of the town which employed him, it is easy to understand that difficulties, especially those of a financial kind, should take from him his power of action. Another man in his place, when he completed extra work for which liberal remuneration would have to be given to outsiders if they were called in, would have sent in his bill without delay, with the consciousness that it would involve him in rows with committees and the town council, that he would be abused by ratepayers in the local newspapers, that he would be threatened with dismissal, but that finally he would not only receive every penny of his charges, but that a precedent would be established and in subsequent years his claims would be met with less and less grumbling, until finally they would be accepted as inevitable. The then town clerk repeatedly urged Mr. MACKISON to prepare his account for extra services, and he warned the committees and the Council that by postponing the settlement of the engineer's claim they were making the task harder for their successors. But all efforts were in vain. After a time the claim came to resemble the proverbial skeleton in the cupboard which neither side care to bring to light, and, as it happened, instead of decaying the dimensions increased as time went on, until it assumed portentous proportions.

When Mr. MACKISON was appointed burgh engineer in May 1868 the population of Dundee was 90,000. The advertisement to which he responded is worth printing as a curiosity:—"The office of Police Surveyor for the burgh of Dundee having become vacant, is now to be filled up. The Surveyor will have to superintend the paving, building and sanitary departments, including cleansing, sewerage and drainage, and the charge of the streets, buildings, &c. He must also be qualified as an architect, and capable to survey and value pro-

perty, and generally to do the duties required. Salary 400*l*." Although the salary is mentioned at 400*l*., it is doubtful for what it was to be paid. Mr. MACKISON considered the amount to refer only to the office burgh engineer. The salary as sanitary inspector was supposed to be 100*l*. in addition, and part of the claim now before the Court is for 3,800*l*., being thirty-eight years' salary for that office, which was never paid. The Local Government Board in 1868 desired to be informed how much Mr. MACKISON was paid as sanitary inspector, and a reply was sent stating that the amount was 100*l*. a year, but his total salary was mentioned. In 1871 there was an increase of salary to 500*l*., but it was not considered by Mr. MACKISON that the sum continued to be irrespective of his salary as sanitary inspector. It will be seen that from the start there was indefiniteness in the financial relations between the official and the Council.

Apparently no higher amount was paid to Mr. MACKISON during his tenure of office. Now let us see what was expected to be done in return for the 500*l*. The total expenditure on works of one class was made out by an accountant as 537,560*l*. Pavements cost 545,319*l*., improvements of streets and roads cost 339,835*l*., and the sewerage 126,075*l*. There were several other items which should be included. For instance, the markets and slaughter-houses cost 57,000*l*. To expect an engineer to become responsible for such a large an outlay and to be contented with a modest salary of 500*l*. a year suggests that men of heroic virtue and limitless self-sacrifice are not rare in Scotland.

If all the works were to be carried out as they were required, or like those for ordinary individuals, it might be said that the proportion between outlay and salary corresponded with what was paid a century before in Scotland. But the works required Parliamentary sanction, and consequently the preparation of plans and estimates which would sustain the closest scrutiny. In these days Parliamentary procedure is familiar to the majority of borough engineers. But in 1871, when an Improvement Act was obtained on the plans of Mr. MACKISON, the steering of a Bill through committees was monopolised by a few men who had to be paid at very high rates. For over thirty years Mr. MACKISON undertook all the Parliamentary work in which an engineer can take part, and, as might be expected from so careful a man, with remarkable success. The Town Council appeared to be unconscious of the labour which was required. On one occasion they offered him an honorarium of 100 guineas, as if that sum were sufficient remuneration. Many years afterwards the reward was increased to 1,000*l*. with an advancement of salary to 100*l*. as a full requital of the long services, but both were declined. The burgh engineer was then an old man, and an actuary would report that the additional amount would not have to be paid during many years. In permitting Mr. MACKISON to undertake duties which it was recognised were outside his official one member of the committee said that all they thought of was whether he was likely to do the work as efficiently as an outsider and more cheaply. In the way year after year was allowed to run without a determined effort to settle the difficulty.

The reason given by Mr. MACKISON for delaying his account was the want of time to prepare so elaborate a document. In making out charges a percentage on estimates or on contracts is the usual basis. In Parliamentary plans and estimates and designing and superintending works which could be regarded as extra to his office, Mr. MACKISON found that his claim amounted to 49,601*l*. The Town Council then offered 4,000*l*. in settlement, which was not accepted; but the claim was reduced to 15,000*l*., which is the sum sought before the Courts.

We believe Mr. MACKISON to have been a conscientious gentleman. But however respectful we may be to his memory we contend that he might have taken

better model than NICK BOTTOM, the weaver. was not considered advisable for a borough council to undertake contracts, but with that exception he was master of the works both architectural and engineering. In connection with the schemes, as any other engineer was employed he must be the leading man in every case. He thought he was qualified for the duties, and his assistants appear to have been of the same humble class. As no question was raised about payment for all his extraordinary services, the Town Council, the good easy men, probably glorified themselves when they compared the cost of architecture and engineering in other towns with that of the burgh engineer's office. In the ordinary course of business had been followed by Mr. MACKISON sent in his bills regularly, the advances of the monopoly would probably be discounted. There would then be a chance for men who are acquainted with construction to find employment in any other way than as draughtsmen or clerks in the office of the burgh engineer.

It is this peculiarity of the case which deserves the consideration both of municipal councils and their engineers. Lord GUTHRIE, in one of his remarks, said:—"I had always the impression throughout the whole time that if Mr. MACKISON had rendered this account he thought it would endanger his position." Why should a reasonable bill for honest services bring such a risk? Mr. MACKISON knew that the Council were living in a fool's paradise, and he lacked the courage to disturb their happiness. If in other cases a similar delusion prevails no time should be lost in putting an end to it. The accounts of the Dundee Town Council were no doubt fully audited and approved. But it was not the accountant's business to inquire into the policy which kept the fees in connection with architecture and engineering out of the books. The Town Council, whatever may be the result of the case, cannot congratulate themselves on their mode of doing business. As regards borough engineers, we need not repeat what we have often said, that the performance of an excess of work is rarely appreciated. Mr. MACKISON was a model official, and the business of the Council, so far as he was concerned, was conducted smoothly. But the offer of less than a tenth the amount he claimed is enough to show how his services were appreciated. That sum we suppose would not have been offered if it were not for the fear of litigation. In dealing with councils it is well for officials to remember how often their constituents are changed, and the new-comers are generally oblivious of the services which were rendered to their predecessors.

DECORATIVE INSCRIPTIONS.

In former days, when "Lucretia Borgia" was included in the repertoire of travelling opera companies, provincial property-men generally found a difficulty in dealing with the scene which represented the palace of the Duke of FERRARA. If it were possible a coat-of-arms appeared on the façade, but generally it was omitted. The inscription beneath it, "BORGIA," was shown in substantial letters, which recalled one of the props necessary for a harlequinade. The hero-tenor is opposed with his sword to remove the B, leaving "ORGIA" as descriptive of the place, and the letter being made of wood used to fall with a thud on the stage. In the Porte St. Martin the incident was, no doubt, better managed, but all old playgoers, at least in the provinces, will recall the familiar sound. It suggested one of the possibilities which await inscriptions where there are thoughtless youths, and it confirmed the wisdom of the English practice in leaving them to be utilised for trade, and for that alone. The neglect of them was typical of our insular character and indifference to the practice of other countries, regardless of its antiquity.

When men found they were able to make records by letters, they were wise in using stone for the purpose. As buildings were supposed to last longer than tablets, walls formed excellent surfaces on which to inscribe the words. It could not have been anticipated that mere tablets of clay were to have a longer duration than the royal palaces of Assyria. But interesting as they are, it must also be remembered that many of the records which have come down to us are cut in stone. Although tablets have been found near temples in some parts of Greece, the absence of inscriptions from the buildings would suggest that it was considered sacrilege by the Greeks to use them even for historical purposes. The Romans were not so fastidious; and an emperor or a private individual who erected or repaired a temple or a bridge, a theatre or a bath, was permitted to announce his liberality on the structure itself. The resemblance between the phraseology of all those inscriptions suggests the fixing of some formula in Rome from which departure was not allowable. At the present time the lapidary style is beyond the resources of many scholars. When we find the Christians in the catacombs or their friends recording their existence and place of burial in long lines of capital letters, we can understand the extent of the desire for remembrance among ordinary Romans. Although he possessed great powers of imagination, HOMER dared not look forward to a longer duration of his fame than was to be found in the lives of his contemporaries. In the verses ascribed to him he implored the women who heard him to mention his name as the sweetest of minstrels, if anyone asked such a question. But at the beginning of our era the Romans were enabled to look forward to a much longer future, and good people desired to have their names associated with it.

The monumental inscriptions of the Romans, and more especially those to be found on temples and triumphal arches, suggest that letters were coming under a law of decoration. Occasionally we find instances where towards the close of a line the letters are not spaced in the same way as at the beginning. But we may pardon the carelessness and insufficient foresight for the sake of the striving after symmetry. Under the best of circumstances Roman letters, when left to themselves, can hardly form an artistic whole, and this fact should be borne in mind when criticising the early efforts to gain attraction for them.

The art of the illuminator imparted a new interest to lettering. A well-written page at first sight seemed to be a triumph of uniformity. But in reality there was a difference between the capitals and the other letters, and greater liberty was allowed to the calligraphists than was possible with stonecutters when dealing with Roman capitals. Memorial brasses continued the principles of the manuscripts, and there seemed no reason why letters should not be employed for other purposes besides those of religion and of memorials of the dead.

According to WARTON, the walls of ancient mansions in France about the fifteenth century were decorated by having love-ditties painted upon them. Besides these and allied compositions, people who took a graver view of life employed Scripture texts and aphorisms from the philosophers. Evidently a third class favoured party cries. We have a survival of the custom in German taverns, especially those in basements. There we can see many old and new compositions in German text. The Germans continue very partial to ornamental lettering, and studious people, when taking their ease, like to be surrounded by something that will recall literature. Germans, however, appear to be as far as ourselves from appreciating inscriptions on the exteriors of buildings unless there are peculiar reasons to justify them. They sanction more often than we do the carving of an architect's name on his building. The German architects are so proud of the distinction that they object to the introduction of contractors' names alongside their own.

The seriousness of the Scottish people was favourable to the employment of inscriptions on buildings, a practice they may have derived from the French. What better advice could be offered to students about indifference to the world's opinion than the words on a stone in a wall of Marischal College, Aberdeen, "Thai say: Quhat say thai? Let them say!" In the kitchen at Abbotsford WALTER SCOTT adopted the old custom of making the stones preach by means of the words, "Waste not: want not." In Edinburgh he could not have failed to see precedents for the practice. On the architrave of a house in the West Bow used to be engraved "Heyt tholis overcummis," which signified that in the end patience conquered; or "to grin and bear it" was sound philosophy. In the Cowgate was another wise inscription, "Gif ve deid as ve sovld, ve micht haif as ve vald," or in Southern English, "If we did as we should, we might have as we would." Over the gate of Craigievar Castle, Aberdeenshire, was inscribed a suggestion which has been widely accepted, "Doe not vaiken sleiping dogges." It is not improbable the advice was familiar before it appeared on a stone slab. The Regent of Marr for his house at Stirling begged kindly criticism, "I prai al lukaris on this lugin with gentil ee to giv thair juging," and the words might often be used in connection with modern residences. The verse which was engraved on Forglen Castle suggested a more firm spirit in the owner, for it announced that envy was a test of worth, and if a man was afraid of censure he should retire to a desert:—

Do veil and dovpnt nocht,
Althoch thov be spyt;
He is lytil gvid vorth,
That is nocht envyt;
Tak thow no tent
Quhat everie man tels;
Gyve thov vald leive ondemit,
Gang quhair na man dvells.

Sermonising is so common in Scotland, both masons and their employers readily adopted the practice. But useful as may have been the intention, it cannot be said the results are decorative. The aim of all art is to afford pleasure, and an attractive house need not warn us it is a pulpit in disguise. Count THIBAUT, of Champagne, apparently was inspired by a truer idea of a host's duties, for, according to the Chronicle, he knew that profound thoughts engendered melancholy, and therefore in his castles at Provins and Troyes he had the walls of the room where his guests assembled painted with the words of the "plus belles chansons" and the most delightful legends. As Gothic lettering was employed in France up to the end of the sixteenth century, those who were able to read the songs and legends probably imagined that such decoration was traditional.

We have no knowledge of any people who utilised inscriptions for decorative purposes with more skill than the Moors or Saracens. The Kufic, Naskhy and Thuluth characters lent themselves to stuccowork and wood-carving as well as to penmanship. Kufic especially, from the preponderance of straight lines and the preference of angular junctions to curves, was adapted for usage in buildings. We cannot suppose the words were as legible as those in Roman characters. Even scholars may have found a difficulty in deciphering long poems when ornamental forms were commingled with them. But patience and ingenuity were rewarded by sentences which recalled the Koran, or praises of some great man, or the self-satisfaction with its beauty which the building or other work expressed in that way. The representation of animal forms was not approved, but it was allowed to describe and suggest them, as, for instance, when a vase says it resembles a devout man turned towards Mecca and about to begin his prayers.

The influence of architecture on minor objects is observable in Moorish work. Similar inscriptions to those found in buildings are to be seen on examples of metal-

work, glass, caskets in ivory, wood coffers, &c. In many of them the name of the person for whom they were made was introduced. Most of the warriors, in addition to their family names, had titles which were supposed to be characteristic conferred upon them, and when these were introduced on any object it became a valuable record. Many instances are to be found in the museum at South Kensington.

The Moorish inscriptions upon the walls of buildings generally consist of verses from the Koran, praise of the owner, the builder or the building and original poems. There are several volumes in which translations more or less exact can be found. For instance in the Alhambra the following inscription is several times repeated in various forms:—"Honour to our master the Sultan, ABOU ABD, ALLAH, ALGANY BELLAH. May God strengthen his rule and increase his happiness." It is remarkable that the Christian artists sometimes adopted a similar formula for the Spanish king. For instance, in Seville there is one to this effect:—"Honour to our master, the Sultan DON BEDR. May God protect him." It is needless to say Sultan BEDR was PEDRO the king. Another favourite inscription for capitals was "There is no other conqueror than God"—words which warriors would be wise to remember.

In the Alhambra there is an inscription on the Gate of Judgment which, if translated, would occupy a dozen lines. And in other places the records are still longer. One of the translators who has attempted to express the meanings was a Mr. SHAKESPEAR. But his interpretations are not accepted by French scholars. Here is one from the Hall of the Two Sisters, translated by Señor. GAYANGOS:—

Praise to God! Delicately have the fingers of the artists embroidered my robe, after setting the jewels of my diadem people compare me to the throne of a bride, yet I surpass it in this, that I can secure the felicity of those who possess me. If anyone approach me complaining of thirst he will receive in exchange cool and limpid water, sweet without admixture, as if I were the bow of the clouds where it first appears and the sun of our Lord Abu-l-hajaj. A monarch whose hands distribute gifts to the needy as often and profusely as the waves succeed each other. May his court be revered and visited as long as the house of God (Mekka) shall continue the resort of pilgrims.

In the inscriptions justice was often done to the artists who created the building. For example, in the mosque of Cordova, after praise of the IMAM, and the Commander of the Faithful, it is announced that the works were completed by DJAFAR, a freed man, the son of ABD-EL-RAHMAN, under the inspection of MOHAMMED the son of AHMED, the son of NASR and of KHALED, the son of HASCHEM, &c., and the inscription terminates with a verse from the Koran. Sometimes the Kufic characters are placed in bands, sometimes they are mixed with the ornament, but however used they do not disturb the general effect of the decoration. It was the aim of the Moorish artists by a diversity of forms to attain a certain evenness both of colour and of form. In other words, the effect sought in tapestry was not ignored in decorations for walls. In that way they produced that neutralised bloom which, according to OWEN JONES should be the aim of every decorator. It was difficult to reconcile that end with the expression of prayer, thanksgiving, flattery, admiration, history and poetry. Indeed, inscriptions with Roman letters always appear prosaic if compared with those in Kufic characters. Attempts were made from time to time to alter Roman letters in various ways and by introducing forms which were more than points for stops. But uncial characters, although perhaps the most successful, never attained the decorative effect of the Moorish lettering.

In our time the excess of business announcements which so often conceals the architectural details of buildings in towns has created a prejudice against the old practice which has been adopted by varieties of people. It is now difficult to imagine that letters could ever become

decorative elements. Single letters, and especially those of Roman form, cannot count for much in that way, but it is possible to produce adaptations which, with the aid of ornament, will give pleasure to all who look on them. But as there are records of a different kind which can convey any information about a building which is desired, it must be acknowledged that not even Egypt or Turkey show any need for decorative inscriptions like those which at one time gratified believers.

LEGAL BOOK REVIEWS.

The Law of Building, Engineering and Shipbuilding Contracts, and of the Duties and Liabilities of Engineers, Architects, Surveyors and Valuers. With precedents and reports of cases. By Alfred A. Hudson, of the Inner Temple, Barrister-at-Law. Third Edition. Two vols. (London: Sweet & Maxwell, Ltd. Price 2l. 12s. 6d.)

The London Building Acts, including the London Building Acts of 1894, 1898 and 1905. A text-book on the law relating to building in the Metropolis, for the use of architects, surveyors, builders, &c. By the late Professor Banister Fletcher, J.P., D.L., F.R.I.B.A., F.K.C., &c. Fourth Edition, revised by Banister F. Fletcher, F.R.I.B.A., F.S.I., and H. Phillips Fletcher, F.R.I.B.A., F.S.I., of the Middle Temple, Barrister-at-Law. (London: T. T. Batsford. Price 6s. 6d.)

THE first of these books is already as well known to members of the building, engineering and allied professional trades as to members of the legal profession. The fact that it has already reached a third edition speaks for it more eloquently than the words of a reviewer. The first volume is a careful treatise upon the principles of the law relating to the subject. The first chapter deals with the question of building contracts generally, and their peculiarities, their construction and the position of the builder. Chapter two is divided into three parts. The first part deals with the authority of architects and engineers, the second part with their duties and liabilities, the third part with the charges of engineers, architects and surveyors. Chapter three deals with quantity surveyors and bills of quantities; chapter four with tenders and contracts generally; chapter five with contracts with public bodies; chapter six with performance and payment; chapter seven with approval and certificates; chapter eight with extras; chapter nine with price and charges; chapter ten with vesting of material, lien and forfeiture; chapter eleven with assignment of contracts; chapter twelve with guarantee and sureties; chapter thirteen with arbitration and award; chapter fourteen with the liability of owners and contractors for nuisance and negligence. The second volume contains a useful collection of reports and precedents. Throughout the book the most recent cases are cited, and the index makes the large mass of material digested readily accessible. So far as we have tested the book the statements in the text are accurate, and fully borne out by the authorities cited. When necessary convenient references are given to text-books which deal specially with outlying portions of the subject. The thorny subject of the Statute of Frauds is very clearly dealt with, and the special rules affecting contracts with the Crown and other public bodies are usefully summarised. We should have liked to see a somewhat fuller consideration given to the effect of the Public Authorities Protection Acts, 1893. The exact extent of that Act is not, perhaps, as yet wholly free from doubt. We should also have liked to see some attempt made to extract the principles (which are not altogether consistent) underlying the various decisions which have been given upon the extent of its application. A very clear account is given of the subject of suretyship, and assignment of rights under a contract, so far as it applies to a subject in hand. On the whole the book is an able summary of the general principles of the law in their application to the whole subject of building contracts. It gives to the lawyer the information necessary to connect his legal knowledge with the operations of building; and to the builder, engineer

or architect the information necessary to enable him to see the point of view from which the law regards the various operations of his trade or profession.

The second of these books is also well known to all builders and architects. The London Building Acts and by-laws are printed on thin paper in a form which renders them portable; and the index enables any point arising under them to be easily found. The explanatory notes and cases generally cover the points upon which difficulty may be likely to arise, or, at any rate, provide a reference which will put the inquirer on the track of the decisions which may enable him to solve his difficulty. The plans and diagrams contained in the book add greatly to its value, both to the architect and the lawyer. We have no doubt that this work will be found an improved edition of an already good book, and that it will meet with the success of its predecessors.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. T. E. Colcutt, president, in the chair.

Mr. ALEXANDER GRAHAM (hon. secretary) announced the decease of the following members:—David Jenkins, elected Associate 1888, Fellow 1894; W. Hewson Lees, Associate 1865; George Saunders, Associate 1856, Fellow 1869; W. Wood Robertson, elected as Fellow in December last, and Sir Benjamin Baker, elected hon. Associate 1896.

Reinforced Concrete.

A provisional report of the committee consisting of Sir Henry Tanner, Messrs. Walmisley, Dunn, Max Clarke, Searles-Wood, Watson, Dru Drury, Greenwood, F. May, Collins, Cockrell, Colonel Mayne, Major Paul, Colonel Winn, Professor Unwin, Messrs. Colson and Marsh was presented. It stated:—

1. Reinforced concrete is used so much in building and engineering construction that a general agreement on the essential requirements of good work is desirable. The proposals which follow are intended to embody these essentials, and to apply generally to all systems of reinforcement. Good workmanship and materials are essential in reinforced concrete. With these and good design structures of this kind appear to be trustworthy. It is essential that the workmen employed should be skilled in this class of construction. Very careful superintendence is required during the execution of the work in regard to—

(a) The quality, testing and mixing of the materials. (b) The sizes and positions of the reinforcements. (c) The construction and removal of centring. (d) The laying of the material in place and the thorough punning of the concrete to insure solidity and freedom from voids. If the metal skeleton is properly coated with cement, and the concrete is solid and free from voids, there is no reason to fear decay of the reinforcement in concrete of stone, gravel, cinder, coke-breeze, &c., made with clean fresh water.

2. The by-laws regulating building in this country require external walls to be in brick or stone, or concrete of certain specified thicknesses. In some places it is in the power of the local authorities to permit a reduced thickness of concrete when it is strengthened by metal; in other districts no such power has been retained. We are of opinion that all by-laws should be so altered as to expressly include reinforced concrete amongst the recognised forms of construction. A section should be added to the by-laws declaring that when it is desired to erect buildings in reinforced concrete complete drawings showing all details of construction and the sizes and positions of reinforcing bars, a specification of the materials to be used and proportions of the concrete, and the necessary calculations of strength based on the rules contained in this report, signed by the person or persons responsible for the design and execution of the work, shall be approved by and submitted to the local authority.

3. *Fire Resistance.*—(a) Floors, walls and other constructions in steel and concrete formed of incombustible materials prevent the spread of fire in varying degrees according to the composition of the concrete, the thickness of the parts and the amount of cover given to the metal.

(b) Experiment and actual experience of fires show that concrete in which limestone is used for the aggregate is

disintegrated, crumbles and loses coherence when subjected to very fierce fires, and that concretes of gravel or sandstones also suffer, but in a rather less degree.* The metal reinforcement in such cases generally retains the mass in position, but the strength of the part is so much diminished that it must be renewed.

Concrete in which coke-breeze, cinders or slag form the aggregate is only superficially injured, does not lose its strength, and in general may be repaired. Concrete of broken brick suffers more than cinder concrete and less than gravel or stone concrete.

(c) The material to be used in any given case should be governed by the amount of fire resistance required as well as by the cheapness of, or the facility of procuring, the aggregate.

(d) Rigidly attached web members, loose stirrups, bent-up rods, or similar means of connecting the metal in the lower or tension sides of beams or floor slabs (which sides suffer most injury in case of fire) with the upper or compression sides of beams or slabs not usually injured, are very desirable.

(e) For main beams a covering of $1\frac{1}{2}$ inch to 2 inches of concrete over the metal reinforcement appears from experience in actual fires to afford ample protection to the structural parts. In floor slabs the cover required may be reduced to 1 inch.

All angles should be rounded or splayed to prevent spalling off under heat.

(f) More perfect protection to the structure is required under very high temperature, and in the most severe conditions it is desirable to cover the concrete structure with fire-resisting plastering which may be easily renewed.

Columns may be covered with coke-breeze concrete, terra-cotta, or other fire-resisting facing.

Materials.

4. *Cement.*—Only Portland cement complying with the requirements of the specification adopted by the British Engineering Standards Committee should be employed; in general the slow-setting quality should be used. Every lot of cement delivered should be tested, and in addition the tests for soundness and time of setting, which can be made without expensive apparatus, should be applied frequently during construction. The cement should be delivered on the work in bags or barrels bearing the maker's name and the weight of the cement contained.

5. *Sand.*—The sand should be composed of hard grains of various sizes up to particles which will pass a $\frac{1}{4}$ -inch square mesh, but of which at least 75 per cent. should pass $\frac{3}{8}$ -inch square mesh. Fine sand alone is not so suitable, but the finer the sand the greater is the quantity of cement required for equal strength of mortar. It should be clean and free from ligneous, organic or earthy matter. The value of a sand cannot always be judged from its appearance, and tests of the mortar prepared with the cement and the sand proposed should always be made. Washing sand does not always improve it, as the finer particles which may be of value to the compactness and solidity of the mortar are carried away in the process.

6. *Aggregate.*—The aggregate, consisting of gravel, hard stone or other suitable material, should be clean and angular, varied in size as much as possible between the limits of size allowed for the work. In all cases material which passes a sieve of a $\frac{1}{4}$ -inch square mesh should be reckoned as sand. The maximum allowable size is usually $\frac{3}{4}$ inch. The maximum limit must always be such that the aggregate can pass between the reinforcing bars and between these and the centring. The sand should be separated from the gravel or broken stone by screening before the materials are measured.

7. *Proportions of the Concrete.*—In all cases the proportions of the cement, sand and aggregate should be separately specified in volumes. As the strength and durability of reinforced concrete structures depend mostly on the concrete being properly proportioned, it is desirable that in all important cases tests should be made as described herein with the actual materials that will be used in the work before the detailed designs for the work are prepared. In no case should less dry cement be added to the sand when dry than will suffice to fill its interstices, but subject to that the proportions of the sand and cement should be settled with reference to the strength required, and the volume of mortar produced by the admixture of sand and cement in

the proportions arranged should be ascertained.* The interstices in the aggregate should be measured and at least sufficient mortar allowed to each volume of aggregate to fill the interstices and leave at least 10 per cent. surplus. For ordinary work a proportion of one part of cement to two parts sand will be found to give a strong practically water-tight mortar, but where special watertightness or strength is required the proportion of cement must be increased. The amount of cement added to the aggregate should be determined on the work by weight. The weight of a cubic foot of cement for the purpose of proportioning the amount of cement to be added may be taken at 90 lbs.

8. The metal used should be steel having the following qualities:—

(a) An ultimate strength of not less than 60,000 lbs. per square inch.

(b) An elastic limit of not less than 50 per cent., or more than 60 per cent. of the ultimate.

(c) An elongation of not less than 22 per cent. in the lengths stated below.

(d) It must stand bending cold 180 degs. to a diameter of the thickness of pieces tested without fracture on outside of bent portion.

In the case of round bars the elongation should not be less than 22 per cent., measured on a gauge-length of eight diameters. In the case of bars over 1 inch in diameter the elongation may be measured on a gauge-length of four diameters and should then be not less than 27 per cent. For other sectional material the tensile and elongation tests should be those prescribed in the British Standard Specification for Structural Steel. Before use in the work the metal must be clean and free from scale or loose rust. It should not be oiled or painted, but a wash of thick Portland cement grout is desirable. Welding should in general be forbidden; if it is found necessary, it should be at points where the metal is least stressed, and it should never be allowed without the special sanction of the architect or engineer responsible for the design. The reinforcement ought to be placed and kept exactly in the positions marked on the drawings, and, apart from any consideration of fire resistance, ought not to be nearer the surface of the concrete at any point than 1 inch in beams and $\frac{3}{8}$ inch in floor slabs or other thin structures.

9. *Mixing: General.*—In all cases the concrete should be mixed in small batches and in accurate proportions, and should be laid as rapidly as possible.

Hand-mixing.—When the materials are mixed by hand they are to be turned over and thoroughly mixed on a clean platform until the colour of the cement is uniformly distributed over the aggregate.

Machine-mixing.—Whenever practicable the concrete should be mixed by machinery.

10. *Laying.*—The thickness of loose concrete that is to be punned should not exceed 3 inches before punning, especially in the vicinity of the reinforcing metal. Special care is to be taken to insure perfect contact between the concrete and the reinforcement, and the punning to be continued till the concrete is thoroughly consolidated. Each section of concreting should be as far as possible completed in one operation; when this is impracticable and work has to be recommenced on a recently laid surface it is necessary to wet the surface; and where it has hardened it must be hacked off, swept clean and covered with cement grout. Work should not be carried on when the temperature is below 34 degs. Fahr. The concrete when laid should be protected from the action of frost, and shielded against too rapid drying from exposure to the sun's rays or winds, and kept well wetted. All shaking and jarring must be avoided. The efficiency of the structure depends chiefly on the care with which the laying is done.

Water.—The amount of water to be added depends on the temperature at the time of mixing, the materials and the state of these and other factors, and no recommendation has therefore been made. Sea-water should not be used.

11. *Centring or Casing.*—The centring must be of such dimensions and so constructed as to remain rigid and unyielding during the laying and punning of the concrete. It

* For convenience on small works the following figures may be taken as a guide, and are probably approximately correct for medium silicious sand:—

Parts Cement.		Parts Sand.		Parts Mortar.
1	+	$\frac{1}{2}$	=	1'20
1	+	1	=	1'50
1	+	$1\frac{1}{2}$	=	1'90
1	+	2	=	2'35
1	+	$2\frac{1}{2}$	=	2'70
1	+	3	=	3'00

* The smaller the aggregate the less the injury.

must be so arranged as to permit of easing and removal without jarring the concrete. Provision should be made wherever practicable for splaying or rounding the angles of the concrete. Timber when used for centring may be advantageously limewashed before the concrete is deposited.

12. *Striking of Centres*.—The time during which the centres should remain up depends on various circumstances, such as the dimensions or thickness of the parts of the work, the amount of water used in mixing, the state of the weather during laying and setting, &c., and must be left to the judgment of the person responsible for the work. The casing for columns, for the sides of beams and for the soffits of floor slabs not more than 4 feet span must not be removed under eight days; soffits of beams and of floors of greater span should remain up for at least fourteen days, and for large span arches for at least twenty-eight days. The centring of floors in buildings which are not loaded for some time after the removal of same may be removed in a short time; the centring for structures which are to be used as soon as completed must remain in place much longer. If frost occurs during setting, the time should be increased by the duration of the frost.

13. *Testing*.—Before the detailed designs for an important work are prepared and during the execution of such a work test pieces of concrete should be made from the cement, sand and aggregate to be used in the work, mixed in the proportions specified. These pieces should be either cubes of not less than 4 inches each way, or cylinders not less than 4 inches diameter and of a length not less than the diameter. They should be prepared in moulds and punned as described for the work. Not less than four cubes or cylinders should be used for each test, which should be made twenty-eight days after moulding. The pieces should be tested by compression, the load being slowly and uniformly applied. The average of the results should be taken as the strength of the concrete for the purposes of calculation, and in the case of concrete made in proportions of 1 cement, 2 sand, 4 hard stone, the strength should not be less than 2,400 lbs. per square inch.

Loading tests on the structure itself should not be made until at least two months have elapsed since the laying of the concrete. The test load should not exceed one and a half times the accidental load. Consideration must also be given to the action of the adjoining parts of the structure in cases of partial loading. In no case should any test load be allowed which would cause the stress in any part of the reinforcement to exceed two-thirds of that at which the steel reaches its elastic limit.

Suggestions are also given in the report about methods of calculation, with papers by Professor W. C. Unwin and Mr. W. Dunn.

SIR HENRY TANNER, chairman of the joint committee on reinforced concrete, said the Admiralty, War Office, municipal and county surveyors, district surveyors, Institute of Builders and the Royal Institute of British Architects were all represented on the committee. The reference to the committee was in the following terms:—"To draw up rules for the guidance of architects for the use of reinforced concrete." The result of the committee's deliberations was in the provisional report, which it was hoped would be adopted that night. There had not been hitherto in this country any authoritative pronouncement on the necessary rules to be observed in such construction. In many ways this had prevented the employment of reinforced concrete, such employment being practically prohibited for complete buildings under the ordinary building rules and regulations, and it was only those bodies who were free from these restrictions, such as railway and dock companies, who had been able to avail themselves of so economical and space saving a method of construction, and on these points he spoke from experience. Other countries had been more lenient, and in consequence those countries were far in advance of this, both as to general knowledge of the material and skill in its use. However, they hoped that if the meeting adopted the rules which had been prepared this country might not for long occupy the backward position that it now did. It was found desirable to form sub-committees for the consideration of special branches of the subject, and these were three in number, viz.:—(1) Fire resistance, Mr. T. H. Watson, chairman; (2) materials, Colonel Mayne, R.E., chairman; and (3) formulæ, Professor Unwin, chairman. These committees had to consider an enormous mass of literature, including the regulations in force in other countries, and only those who had studied the subject were aware of the innumerable experiments,

theories, writings and reports of discussions which were available. To begin with, Messrs. Cubitt kindly put at the disposal of the committee seventeen beams, plain and reinforced, for testing to destruction, the direction of the tests being undertaken by Professor Unwin. These were the only tests made under the supervision of the committee, it being found that the available records of all kinds of accurately tabulated tests by various public authorities, technical colleges and other bodies had largely removed the material from the unknown, and that what was required was rather a reasoned theory, based on the recorded experiments than on a further series of experiments of their own, the latter, indeed, being beyond the means at their command. There were, of course, various disputed points which must be settled by further experiment, such as the width of flange in beams, but to these the report drew attention without laying down definite rules. The aim of the committee had been the production of a good working guide, the laying down of the necessary conditions and settling safe rules for a proper disposition of the parts. Hitherto every specialist in this country had made his own rules, perhaps more or less approximately accurate, but the margin of safety had been occasionally cut too fine. It should not be enough that a structure bore its working load without apparent distress, because a specially well-made floor might stand loads far beyond the average without breaking down; but they had to provide such a margin of safety as would cover ordinary inattention or ordinary defects of workmanship. The difficulty had been to determine the merits of rival systems, each specialist naturally regarding his own system as the best; but the report and rules before them would enable an accurate judgment to be arrived at by the architect himself if he had the requisite knowledge, or with the aid of a consulting engineer if he preferred. The rules proposed were by no means revolutionary, and the same principles were being adopted abroad, but with some variations of detail. They could be adopted as the basis on which tenders might be obtained, and so insure that these shall be prepared on equal terms; and it was hoped that they would be of considerable service in placing building construction of this type upon a recognised footing and serve to explode the idea that there was anything of an occult nature connected with the necessary calculations. For some fifty years past, viz. from the date of Wilkinson's patent in 1854, the attention of many men had been directed to improving the theory and adding to the practice of building in concrete reinforced in various ways, and it could not be said that the present state of knowledge was due to the efforts of any one man. Special skill was, of course, needed owing to the limited practice, but in the preparation of the report a preference for any feature which was claimed as patent had been avoided. Therefore special forms of bar or peculiar arrangements were not referred to, and they had confined themselves to the laying down of principles for all kinds of structures reinforced with ordinary bars. The report itself, although short, was the result of many lengthy discussions and investigations. It was not claimed to be final, but simply a reasonable guide in the present state of knowledge. In conclusion, Sir Henry moved the adoption of the report, and that copies with explanatory letters be sent to the Local Government Board and the London County Council.

Mr. JOHN SLATER seconded the adoption of the report, and suggested that the deliberations of the committee would do much to encourage the advance of construction in ferro-concrete. A great deal of the report was of a very abstruse nature, but he thought they could endorse the recommendation of the committee that the existing by-laws ought undoubtedly to be so modified and altered as to allow of the extensive use of the new material.

Mr. E. F. ETCHells, while congratulating the Institute as the pioneers of reinforced concrete construction in this country, suggested alterations to some of the mathematical solutions set forth in the report, which are to be further considered by the committee.

The other speakers were Mr. H. D. Searles-Wood, Mr. Wm. Dunn, Major E. M. Paul, R.E., Mr. Matt Garbutt, Mr. C. F. Marsh, Mr. E. T. Hall, Mr. J. J. Burnet and the President.

A hearty vote of thanks was passed to the committee for their investigations, and the meeting terminated.

The Hearing of workmen's compensation cases, of which there is a list of thirty-six, was proceeded with in the Appeal Court on Wednesday last and will be continued until further notice.

NOTES AND COMMENTS.

THE announcement of the sale of Crosby Hall naturally excites alarm about the fate of the building. To some extent the public should be considered as having an interest in the property, for in 1832, when it was on the eve of demolition, subscriptions were obtained not only for the restoration of the building but for securing an interest in it which was to be equal to a freehold. It was then proposed to use Crosby Hall as a museum of national antiquities—for which it was hardly of sufficient size—or as the theatre for the delivery of the Gresham lectures. What we see at present is no more than a portion of the mansion which was erected in 1465 by Sir JOHN CROSBY, grocer and woolman. It was built of stone and timber, and was the highest at the time in London. Afterwards the Duke of GLOUCESTER, who subsequently became RICHARD III., purchased the property and used it as a residence. Succeeding tenants altered the house, and it seems to have been utilised as a dwelling by foreign ambassadors. Sir JOHN SPENCER, alderman, purchased the house and kept his mayoralty in it in 1594. He, however, allowed "Monsieur DE ROSNEY," Great Treasurer of France, with his retinue, which was very splendid, to be there harboured. In the reign of CHARLES II. the great hall became a place of worship for Nonconformists, and for nearly a century and a half it was used for religious purposes. STRYPE described it as "this large and convenient house now built into a square of good houses and called Crosby Square." Like other buildings in London it was sacrificed to the purposes of trade, and was occupied by wharfingers and packers. At the present time it is a restaurant. But it has been embellished to an extent that would have amazed Sir JOHN CROSBY and the fifteenth-century builders. Whether it will be continued in that use or will be sacrificed to make way for a building of a different class—say, a bank—are questions which seem to be insolvable for the present.

THE craze for cheap cottages has had the effect of making people believe that substantial buildings can be erected for small sums and that an architect can anticipate the outlay to a penny. A case which was heard a few days ago in the Portsmouth County Court suggests the effects of the belief. Mr. WILBERFORCE COBBETT, of Fareham, architect, prepared three sets of plans and specifications for a client who wished to erect a cheap house. The defendant said that he could not expend more than 300*l.* on the building, but the builder's tender was 364*l.* Then the defendant said he could not use the plans and returned them. Afterwards a cheque for 3*l.* 3*s.* was sent, which plaintiff declined to accept on the ground that the amount was below the Institute scale. A builder gave evidence that the cost of the house as erected from other plans was 283*l.* The Judge decided in favour of the defendant. He considered that when a man asked for plans of a house to cost 300*l.* it was unreasonable to plan a house that would cost 364*l.* Such a difference was too wide to be excused. The plaintiff therefore not only loses his labour, but will have to pay costs. The result is ominous not only for the ignoring of the Institute scale, but for making a tender become the only test of the fitness of a plan. We suppose the builder would not have denied that the house which was to cost 360*l.* had advantages over one costing 283*l.* But the difference was not taken into consideration.

It is reported by Sir PERCY SANDERSON, the British Consul at New York, that there is a considerable increase in the importation of works of art from France, the value in 1906 being nearly three times as great as in 1904. The dutiable value was entered for last year at 852,000*l.* Unfortunately, the value of the imported

works of art from the United Kingdom decreased compared with 1905, and were only fractionally higher than in 1904. British artists and dealers are at a disadvantage in respect of this class of goods, having no reciprocity arrangements with the United States, and have France, Italy and Portugal. Why the United Kingdom should be handicapped is not plain, and inquiry on the subject should be made in Parliament. American amateurs profess to admire the paintings and other works produced in this country, but the price to be paid for them is higher than is expected for French and Italian works, and the heavy import duty accordingly becomes prohibitive.

It is fortunate for the Musée Guimet in Paris that M. GAYET is not under the obligation to hand over the results of his explorations at Antinoë to the Egyptians. Knowing the preference of French people for whatever is directly representative of life, he has given more attention to mummies than is now common with the majority of archæologists. The consequence is that the Musée is becoming a portrait gallery, which has an unique charm. Among the revelations of this year is a Lady DIOUNESAST, who was a favourite with the king. The remains were found in a vaulted chamber lying in a sarcophagus, which was in the Greek style. The figure was clad in a robe of grey silk, adorned with arabesques. The vest was red, and the head rested on a cushion marked by blue, red and yellow stripes. In the sarcophagus were a crown of plaited straw and leaves, ivory figures of bacchantes, a statuette of HORUS, two glass flagons, three vessels of terra-cotta, a thyrsis and a ring. Elsewhere was found a figure which is described as that of a prophetess. During the past year M. GAYET has been fortunate in discovering several painted portraits of a late period of Egyptian art.

THE practice of submitting tenders at prices which are below market rates, and then after acceptance declining to enter into a contract on account of clerical errors, is growing. There can be no question that delay, inconvenience and confusion follow that way of transacting business, and it is sometimes imagined more serious consequences are likely to arise from such a beginning. One of the members of the Portsmouth Town Council at the meeting this week proposed the following resolution in order to put a stop to the practice:—"That in the event of any person or firm submitting to the Council a tender for any goods or work, and desiring to withdraw the tender for any reason whatsoever after its acceptance by a committee or by the Council, no tender subsequently submitted to the Council for goods or work by such person or firm be considered or received by a committee or by the Council for a period of three years from the date of the withdrawal of the previous tender, and that a notification to this effect be appended to all forms of tender." The proposal was not adopted, but it suggests the discontent which exists in many municipal council-rooms. Contractors, like other mortals, are liable to mistakes, and when they are accidental it is right to overlook them, but deliberate errors to gain a purpose and to complicate business should not be readily pardoned.

HAMPTON COURT.*

THOMAS WOLSEY was born in 1471 and died in 1530. The son of a butcher at Ipswich, he was early sent to Magdalen College, and obtained his degree of Bachelor of Arts before he was fifteen years of age, and thus became known to his friends as the "Boy Bachelor." Showing thus early his aptitude he soon acquired a fellowship at Magdalen and became a master of the college school, where he had as pupils the sons of the Marquis of Dorset, who presented Wolsey to his first cure, the living of Wymington, Somerset. The next step in his career was the post of domestic chaplain and secretary to Henry Deane, Archbishop of Canterbury. Then, after a short period in continental chaplaincy, he was appointed chaplain to the king. He came to the notice of Bishop Fox, Lord Privy Seal, and Sir Thomas Lovel, treasurer of the royal household, and his ability procured for him some diplomatic commissions at the courts of Scotland and Germany. Subsequently he obtained the deanery of Lincoln, was almoner to the king and a royal councillor. Then he received the living of Torrington, in Devonshire, became Registrar of the Order of the Garter, and Canon of Windsor. In 1514 he was consecrated Bishop of Lincoln, and in the same year Archbishop of York. In the succeeding year he received a cardinal's hat from the Pope, as well as a commission as legate. Other benefices were showered upon him through the king's favour, and the proud prelate became rich—not that he neglected the duties of wealth while accepting its gifts. He founded Cardinal's College, Oxford (now Christ Church), and built a new grammar school at Ipswich and has left us also the palace of Hampton Court, which he designed and built in part. His rapid rise was followed by a still swifter fall, delineated by

make a glorious report of it in their country, to the great honour of the king and his realm." Such great preparations were made and the guests sat down to the wonderful feast provided for them, but the cardinal had not yet appeared. The gaiety was at its height when before the second course my lord cardinal came in, booted and spurred, and bade them welcome. All rising in their places he bade them be seated, called for a chair, "and sat down in the midst of the high paradise, laughing and being as merry as ever I saw him in all my life."

It would have been unworthy on entering Hampton Court not to pause and contemplate for awhile the singular story and fate of the great man who raised it. These ancient towers and courts are full of the memory of that strange fortune, and will be for many a long generation yet; and now that the great mass of the people is at once admitted to education and to this place, the history of Wolsey—at one time said to be a butcher's son, at another stretching his lordly hand over this realm, making foreign princes tremble at it, reaching it out even to the papal tiara, and then again a poor and sinking suppliant, exclaiming,

"O, father abbot,
An old man broken with the storms of state
Is come to lay his weary bones among ye;
Give him a little earth for charity."

—will be more widely known and wondered at. (Howitt, "Visits to Remarkable Places.")

The original design of Wolsey, who was a born architect in addition to his other attainments, was a building with five courts, wholly of brick, ornamented with an interlacing of dark-coloured bricks. He lived here in a way that far exceeded the magnificence of many a sovereign

Shakespeare with all his wonderful facility and dramatic instinct. Retiring finally to Leicester Abbey, there he died and was buried, but no monument remains to mark the place of his interment.

Hampton is recorded in Domesday Book as Hamntone, where it is stated that the whole value of the manor was forty shillings. It passed into the hands of the Knights Hospitallers of St. John of Jerusalem, and Cardinal Wolsey secured a lease for ninety-nine years from Sir Thomas Dewra, the last prior. He commenced to rebuild the manor-house, which is the starting-point of the noble block of buildings now existing. Henry VIII., on his favourite's disgrace, demolished the hall, chapel and other buildings, so that the present hall is the work of the king. Wolsey made a present, probably involuntarily, of the palace to the king, who in return bestowed upon the cardinal the manor-house at Richmond; however, he frequently visited Hampton Court, for we find that at Henry's direct command he entertained the ambassadors of the Court of France in 1527. Wendish, in his "Life of Wolsey," says that "he called before him his principal officers, to whom he declared his mind touching the entertainment of the Frenchmen at Hampton Court, commanding them neither to spare for any cost, expense, or travayle, to make such a triumphant banquet as they might not only wonder at it here, but also

He had two thousand persons in his suite, and there were beds for two hundred and eighty visitors of high rank.

Entering the palace by the western gateway we note the western quadrangle, occupied chiefly by Government pensioners, and the barracks are adjacent. The principal gateway is flanked with octagon towers with a fine pointed arch; above are the Royal arms and a large stone bay window. The Great Hall was built by Henry VIII., and is a grand building, possessing one of the finest roofs in the kingdom, ranking with those of Eltham, Crosby Hall and Westminster. The stained glass is modern, but in excellent taste and keeping with the hall itself. The hall was originally tile paved and had the open hearth, which had the fire to supply both light and heat. The wonderful tapestries upon the wall, illustrating scenes in the life of Abraham, were taken in an inventory in 1548, with other effects of Henry VIII. Again in 1649 an inventory of Charles I.'s goods included the tapestries, which were estimated at 10*l.* a yard, totalling 8,260*l.* They were retained for Cromwell's use, and we can realise that they have passed through all these years from Henry VIII.'s time till now, and are in a wonderful state of preservation.

The king's great staircase is approached through the interesting colonnade, and here we enter the domain of Sir Christopher Wren's work, which was finished about 1700. The decoration of the staircase is impossible of description in a limited space, as becomes so transcendent a theme as

A paper read at a meeting of the Upper Norwood Athenæum by Mr. Charles Wheeler on May 4.

the Banquet of the Gods; Gods and Goddesses, Nymphs and Satyrs, Muses and Bacchanalians, Æneas and the Twelve Cæsars, Juno, Romulus, Ganymede, Hercules, Flora, Apollo. All these and many more are represented in coloured magnificence. We reach the fine collection of arms arranged for William III. by a gunsmith named Harris, who also marshalled some of the arms at the Tower and Windsor Castle.

Of the royal personages who have left signs of their association with Hampton Court, Henry VIII., of pious memory, comes first. Jane Seymour died here after giving birth to Edward, who became the sixth king of that name and lived here during his earlier years. Queen Mary and Philip of Spain spent their honeymoon here, and Queen Elizabeth occupied the palace frequently. Here she kept Christmas in right royal fashion, and received the news of the defeat of the Spanish Armada on Michaelmas Day. Charles I. spent his honeymoon here, and took refuge in his wanderings in the Civil War. John Evelyn, whose house at Wotton we visited together last year, writes under date October 10, 1647:—"I came to Hampton Court, where I had the honour to kiss His Majesty's hand, he now being in the power of those villains who not long after murdered him." Cromwell used the palace, and even, it is said, the king's bedroom. He acquired the buildings, and his daughter Elizabeth was married from here to Lord Falconberg in 1657. Later kings who utilised the palace as a residence were Charles II. and William III., and it was in the park that the latter king met with the accident that caused his death.

SIR F. BOURGEOIS AND THE DULWICH GALLERY.

THE numerous references in Ruskin's "Modern Painters" to the paintings in the Dulwich Gallery are enough to suggest that the collection is deserving of more attention from students than it receives. It is true that some examples are imitations instead of originals. Desenfans, although a collector and dealer, was often duped, and in gathering the paintings which are now at Dulwich he was not more infallible than at other times. But it is doubtful whether there is one gallery in Europe in which all the works are beyond doubt. There was, however, an element which some would call Fate in the history of the Dulwich collection which compensates for occasional shortcomings. To find pictures which were purchased for a royal gallery in Warsaw in the possession of the authorities of an English school as gifts is an almost unique incident in the history of collecting.

Sir Francis Bourgeois, whose name is mainly associated with the transaction, was one of those mortals who, though not blessed from their birth by any rare endowments of the mind, are placed by the caprice of fortune in situations to become the envy of even the most able of the children of genius. "There is a pleasure in painting which none but painters know," said an enthusiastic votary of the art. There is also a pleasure in possessing, which painters seldom know, but which the true collector would not exchange for any which might arise from mere mechanical labour. It was the good fortune of Bourgeois to share both pleasures; and if he had not the power to hand down his name to posterity on the one side as the inventor of great works, he has done that which is almost tantamount as the founder of a gallery from which thousands may continually receive lessons in taste and enjoy hours of delight in perusing works of far more varied character and excellence than could have been put together by the unaided exertions of almost any individual.

Bourgeois was descended from a Swiss family which was said to have held several respectable offices in the State in their original country, but which had sunk into obscurity, and, like many others, sought in England the means of retrieving their fallen fortunes. He was born in the year 1756 in London, his father having pursued there the occupation of a watchmaker in St. Martin's Lane. When about eight years of age, Noel Desenfans, whose name must be ever connected with his, came to lodge at the same house. This gentleman was a teacher of languages, in which capacity, being moreover a man of great natural ability, he gained the means of acquiring powerful connections. He had also a great predilection for the arts, and was consulted by many of the nobility in the formation of their galleries. His taste and knowledge in matters of art became at length known to the unfortunate Stanislas,

king of Poland, who remitted to him a considerable sum of money for the purchase of paintings for the Royal Gallery at Warsaw. The subsequent ill-fate of that monarch prevented this destination of the pictures which had been bought, and they remained in the hands of Desenfans.

Such a prize was sure to excite the jealousies of his fortunate fellow-adventurers, and all sorts of surmises were spread about him, and the world forgot—what should have expected the experience of 4,000 years might have taught it—that in our actions we are as much slaves as the masters of circumstances. What might be the singularity of the acquirement, the session of such treasures became a matter of considerable notoriety, and the destination of them by the collector one of as considerable speculation. Even the curiosity of royalty was excited, and George III., with a degree of *bonhomie* which led him to inquire into the private circumstances of many of his subjects who lived in thought of such inquisitorial surveillance, condescended to make himself master of the secret. It was after an audience with the king that Bourgeois said to a friend: "His Majesty has congratulated me on being Desenfans's heir. I assured His Majesty it was the first intimation I had of such good fortune attending me." This good fortune, however, did await him.

Having early showed a predilection for the arts, Bourgeois was placed as pupil with Louthembourg at the instance of Desenfans, whose example and conversation perhaps was which had awakened the feeling originally. Under Louthembourg's instructions he paid considerable attention to his art, and made himself master of the elementary principles. He afterwards travelled on the Continent, and proceeded through Germany to Poland, where, with letters from his friend Desenfans, he was favourably received by the king, who conferred on him the knighthood of the Order of Merit. This honour was, on his return to England, confirmed to him by George III., when he was appointed landscape-painter to the king. Thus he afterwards continued the practice of his profession with great perseverance, but though his works displayed a strong feeling for art and met with many admirers, they must be pronounced crude and sketchy, and not such as in the present day would be thought to entitle an artist to the honours of the Academy. He was, however, elected an Associate in 1791, and an Academician in 1793, but he soon after retired from the more active pursuit of art, M. Desenfans having in 1818 bequeathed to him his property, with the paintings before referred to.

This was, perhaps, in some measure due to him, having given very considerable assistance in the selection as M. Desenfans, though a man of considerable shrewdness and some taste, had not that tact and knowledge of which is always necessary for a collector of pictures. Before the death of Desenfans a sale of his pictures was made. The best were reserved and bequeathed to one who had the good sense to leave them in such a manner as enabled the public to receive the full advantage of such a collection. Sir F. Bourgeois having been placed in a situation to enjoy the pleasures of a cultivated taste and refined society was in the habit of visiting the Master and Fellows of the Charitable Foundation or College at Dulwich, for the maintenance of which estates had been left in the reign of James I. by Alleyn, the actor. On one of these occasions it was incidentally suggested that to that body his collection would be an appropriate gift, as they already had a gallery, and were not shackled with any onerous duties which might divert them from the due care of the paintings; the distance from London also was not inconvenient for visitors, while it would operate favourably in preserving them from the atmospheric and other evil influences of the Metropolis. The idea remained in his mind, and after an ineffectual offer of the collection to the Government upon certain conditions of building a gallery, which was refused, he determined to bequeath them to the Master and Fellows of Dulwich College, with such a sum as should insure their proper preservation. This he duly carried into effect, leaving with the paintings (above 350 in number) the sum of 10,000*l.* for their better kept in order, with another sum of 2,000*l.* to build or add to a gallery for their disposal. He also bequeathed 1,000*l.* each to the Master and Chaplain, and left the Master and Fellows his residuary legatees.

The collection though containing, as may be supposed, among so great a number, many inferior specimens of school of the masters, among others presents some of unrivalled excellence. It is rich in specimens of the Dutch and Flemish schools. The specimens of Murillo also

uable, and some of the Italian school (where, however, deficiency is principally to be perceived) very brilliant. There are a few additions by Sir F. Bourgeois from the pencils of modern artists, and among them a portrait of Desenfans by Northcote. A portrait of Bourgeois by his friend Sir W. Beechey was completed only a few days before the fatal accident occurred—a fall from his horse—which was the cause of Sir F. Bourgeois's death on January 8, 1817. He was buried by the side of Desenfans in the chapel of the college at Dulwich, according to his own wish.

In private life Bourgeois was universally esteemed, and the public owe him a debt of gratitude which is not the less just for its not having been more ostentatiously demanded or more thankfully acknowledged. Some of his own works are placed by his legatees among the paintings he bequeathed. They prove him to have been not only extremely mannered, but also, as far as his aptitude for art allowed, a close copier of his master Loutherg. Bourgeois was an exhibitor at exhibitions of the Royal Academy from 1779 to 1810. Besides landscapes he painted some figure-pieces, one being a portrait of John Mable as "Coriolanus."

JOINERY AND FURNITURE-MAKING.*

JOINERY is one of those crafts which have to do with the building or fitting, the decoration or furnishing of solid and permanent structures. In this architectural process it is found that certain materials are better adapted than others to certain purposes. The upright walls of the structure, for instance, can be built of almost anything; but stone or brick are generally used because they are better adapted for the purpose and much more abundant than any other material, and by reason of their weight and fragility are useless for non-architectural purposes. But to use stone or brick for the roof or the upper floors of a building is more questionable and difficult matter. The difficulty consists in carrying the heavy and brittle material under the downward action of the force of gravity from any one point to another which is not vertically above it. With stone or brick this can only be done, if the two points are a considerable distance apart, by the use of the arch or vault, and this is always an expensive process, whilst in the case of floors it involves a great waste of space and material between the floor and the vaulted ceiling.

But there is another material, wood—light and fibrous, strong in the direction of its grain, which can easily be carried in a straight line, and therefore with the least possible waste of space or material, from one point to another some distance off in a horizontal or an oblique direction; and, since this material is also fairly abundant and quite easy to work, it is generally the best material to use for roofs and floors. Iron (or other metal), the third material available by the architect for structural purposes, differs from stone and wood in that it is much stronger, even in proportion to its weight, though it is also heavier, and in that it is equally strong, whereas stone, as a rule, is equally weak in all directions, wood standing between the two as being strong in one direction alone. For this reason iron differs from wood and stone in that it can assume not only the curved and the rectilinear, but the hanging or catenary form, as in a suspension bridge, between one point and another in the same vertical line. These important properties of the three materials may thus be represented by the following diagram:—

FIG. 1.

From this it appears that the most characteristic, though not always the only possible, use of each material in solving a given problem is indicated by the corresponding form. It is a principle of the first importance in the archi-

tectural crafts that no material should be put to any but a characteristic use; so that in the spanning of apertures, where the catenary for architectural purposes would be worse than useless, iron should have no use at all. A good instance of the violation of this principle may be seen in the entrance hall of the Natural History Museum, South Kensington, where the proportions of the arched system are utterly spoiled by the use of iron, on a scale quite insufficient to have been of the right material in the uppermost series of arches.

It is in accordance with this principle, to which I shall refer again, that wood may be used, though not in that arched form which is characteristic of stone, for the roof and floors of a building. But the art of using wood thus for structural purposes is the art of the carpenter, not that of the joiner, with which I am dealing to-night. The work of the joiner only begins when the shell of the building is finished; it consists in providing doors, window frames and sashes, handrails and other permanent fittings. And though in roofing a building we may sometimes hesitate between the stone vault and the timber gable, there is no doubt whatever that for doors and handrails, as also for such portable furniture as chairs and tables, wood, by reason of its strength, lightness and beauty, and of its pleasantness to the touch as compared with stone or metal, is very much the best material.

Now the nature of each of the building crafts is of course very largely determined by that of the material used, and wood has several peculiar properties in addition to those which I have already described. One of the chief requirements of a door, which has exactly to fill a given aperture, is that it should remain constant both in size and shape. And one of the most characteristic properties of wood, the material which in other respects it is most convenient to use, is its natural disinclination to constancy either of shape or size. Wood is a fibrous material any prism of which cut with its axis parallel to the grain will be usually of constant length but of variable cross-section. The area of its cross-section, that is to say, will continually decrease as the wood dries, and even after the wood is dry it is sensitive to changes of atmospheric condition, swelling or shrinking as the moisture of the atmosphere becomes more or less. And not only is the cross-section of such a prism variable in area, but also in shape. This is due to the fact that thin laminæ of shell-like cellular tissue are distributed through the substance of the tree at small and fairly regular intervals in planes which pass through the heart, and that these laminæ or medullary rays tend to resist the shrinkage of the wood in the direction in which they lie. These laminæ, that is to say, draw together as the wood dries, but do not very much contract in their own dimensions. As seen in cross-section, where either to the naked eye or under a microscope they appear as radii of the annual rings, these rays tend to close upon one another like the ribs of a lady's fan. Some of the results of this tendency are illustrated in my first slide (fig. 2). The card fan is to represent the cross-section of an oak tree out of which have been cut, whilst the wood is still green, the three flat boards, AA' BB' and CC', and the two square posts, P and Q. As the wood dries the medullary rays—the leaves of the fan—close upon one another thus, with the result that the boards, AA' and BB', contract in width

FIG. 2.

and become convex towards the centre or heart of the tree. These deformations are more pronounced in AA' and in the middle of BB', where the rays cross it obliquely; whilst CC' and the outer parts of BB', which lie in the direction of the rays will hardly be deformed at all. The square posts, moreover, are no longer square, P, which the rays cross in the direction of its diagonal, being further deformed than Q, which the rays cross in a direction parallel and perpendicular to its sides.

My second slide shows two actual cases of these

deformations. It also shows a square post which contains the heart of the tree and in which, since the medullary rays cannot close up all round the heart without somewhere opening a crack in the log, we find the expected crack opening, as we should expect, between the heart and one of the nearer surfaces. There are cracks also on other sides of the log, but these are due to the fact that the

FIG. 3.

log dries from the surface inwards, and they will close up again, whilst the other shake will open still further as the log continues to dry, and there are cracks called "heart-shakes," starting from the heart but not reaching the faces of the log, which would have been there when the tree was first cut down and which I will not try to explain.

From these examples of the curious behaviour of wood we can draw some important morals. If, for example, a post which the rays cross diagonally is to form the leg of a table it should be set so that the rays are tangential, and not normal, to the circumscribing circle; for on this will depend whether the outside shoulder-joints between the leg and the rail open or not as the leg dries. But the most important moral of all is that which relates to the cutting of a flat board, especially when it is most desirable, as in the case of a table top, that the board should neither warp nor shrink. In this case, as you see on reference to the model, the board should be in a plane which lies as near as possible to the heart of the tree, though on one side or other of the part nearest the heart, so that the medullary rays are as nearly as possible parallel to its surfaces, as they are in this illustration. For when thus cut the board will have little inclination to warp, and its shrinkage, as the rays close upon one another, will affect the thickness, where it cannot be great, rather than the width of the board. And here is an admirable instance of the poetic justice of nature, which generally contrives that what is rightly done from any one point of view shall be rightly done from every other; and in particular, that the requirements of use and beauty shall be satisfied at the same time. For it is when the board is cut in this way that the rays, if they are visible at all, crop out most beautifully on the surface, as they do here, in great flakes and splashes of light; and, strangely enough, there is one wood, oak, in which the rays are much more plainly visible than in any other, and it is just this wood which is more liable than any other to warp and shrink when improperly cut. Moreover, the board is more easily sawn out or rent, and very much more easily planed up, when it is cut in this way; so that there are three important reasons, any one of which would be alone sufficient, for cutting as many boards as possible out of an oak log in this way rather than in any other.

I will show you, then, how this may be done, assuming that we wish, as we naturally should do, to cut boards of various thicknesses out of one or any number of trees. But first let me show you how an oak tree is generally cut up by an English timber merchant as an example of how it ought not to be done. We are justly proud of our English oak as the finest timber in the world, but I am sorry to say that if we see an oak tree cut up in the right way we may be almost certain that it was not cut up in England. One thick plank, containing the heart shakes, is cut out of the middle of the tree, because, they say, boards cut here would be useless on account of the heart shakes, and the rest of the log is cut into boards parallel to this plank. The consequence is that only two or three boards on each side of the plank—only five or six altogether out of the whole tree—are cut in the right way, and that the thick plank, though it may be used for fencing or other outdoor work, is almost useless to the joiner as it is penetrated with shakes throughout; but it is just where they take this thick plank that we can cut the best figured and, but for the heart shakes, the most valuable boards, and since a long heart shake, which may

spoil half the thick plank, will only spoil a small part each of the thin boards, this is clearly the right thing to do—cutting the thinnest boards we want for door panels &c., out of this part of the tree and so making the best possible use of it. As soon as we are clear of the heart shakes we can cut thicker stuff to be used in larger pieces for table tops, &c. Above and below these we cut two sets of boards in the vertical plane, narrow but beautifully figured, and exactly suitable for the stiles and rails of doors or other framed structures, and outside these again, we can cut table legs or other posts, though remembering their tendency to deformation as the wood dries. This is merely an intelligent variation of the ordinary continental and American method of cutting wainscot or cutting it, as they say, "on the quarter."

I will now return to the question of door making, in connection with which I can illustrate most of what I have to say on the subject of joinery. From what I have said you will see that it is impossible to make a good door of a single board, even when sufficiently wide stuff is available. It would shrink, it would warp, and it would be very liable to split longitudinally if subjected to a violent shock or slamming, or by a determined house-breaker. The problem here, as in every wooden structure, is to obtain the strength and constancy of dimension in all directions whilst the material possesses in one direction alone. This may at first be attempted by screwing or bolting other pieces of wood with the grain horizontal—ledgers, as they are called to one side of the original wide board. But even so the tendency of the latter to shrink will probably result either in its splitting or in its buckling the ledgers, for the strength of this tendency is almost inconceivable till one sees the effect of it. The next attempt, therefore, to solve the problem will be by making the width of the door in several pieces bolted, as before, to horizontal ledgers, but with tongue and grooved or overlapping edges, so that the pieces may shrink separately without buckling the ledgers, showing daylight between their joints. In this case, however, the door will obviously require bracing, the lap-joints of the vertical members will afford a good opportunity for moulding, and we get at last a door such as that shown in the following slide. This is the first type of thoroughly good door. It will always be popular on account of its cheapness, and is actually often preferred for its intrinsic merit to the next and more elaborate type. I have one objection to it is that on the side on which I cannot see the construction I wish that I could, and on the side which I can see it is generally so clumsy that I wish that I could not. The fact, moreover, that its construction involves the use of bolts or screws gives it just the same inferiority to the next kind of door that a packing-case has to a chest of which the sides are dovetailed.

The great virtue of the framed and panelled door is that its construction is visible on both sides, that it is highly characteristic of the material, and that it does not involve the use of any other—it can be made without screws or nails. The most elementary form of such a door consists of five pieces of wood, four thick narrow pieces grooved at their inner edges and mortised and tenoned together to form the frame, and one thinner and usually wider piece to form the panel, fitting into the grooved frame. I have here a sample of such a door in process of being put together. The mortises are usually cut on the vertical members—the frame, the stiles and the tenons on the horizontal rails. Here, if the groove is deep enough and the panel does not quite touch its inner surface, it is clear that the panel is free to shrink or swell without leaving or deforming the frame-work, the inner edges of which will form a rectangle of constant size; and if the stiles are sufficiently narrow to prevent the tendency to alteration of the whole width of the door, the width will be much less than that of a single board of the same width.

Before describing the possible elaborations of the simple form, I must call your attention to certain small points which should be observed in construction. The tenons may either be carried right through the stiles and fastened with wedges, as in the specimen, or carried only part way through, when they are called sub-tenons, and fastened with wooden pins. The former is the stronger, and in modern joinery the most usual method; but it is subject to this danger, that if the stiles are not quite dry they will shrink away from the shoulder, leaving an open joint which disfigures and weakens the door. The usual recipe for providing against the opening of the shoulder-joints is to say that the wedges should be so cut as to fit more tightly at their inner than at their outer ends. A safer precaution

however, is to put saw cuts in the tenon and insert the edges in these cuts instead of outside the tenon as in the ext slide, and either to use glue on the wedges only, or, at events, to see that there is no glue on the upper and lower edges of the tenon at its outer end. In this case the tenon is really dovetailed into the stile instead of being merely held by compression, as it is by the usual method, and if the stile shrinks it is just as sure to shrink towards the shoulder rather than away from it as a ball is to roll down-hill rather than up. If, however, the wedges are placed in the usual way it is a good plan to use glue on their inner surfaces only, so that they become part of the tenon rather than of the stile, with the same advantages as are obtained by the other method.

By the use of intermediate members of framework, vertical, horizontal or oblique—rails and muntins, or struts and braces—with the requisite number of panels, this type of door may be elaborated to any extent.

Here are some examples of doors and other panelled structures from the Victoria and Albert Museum, kindly lent by the Board of Education, which I have arranged in chronological order, with the purpose of illustrating and trying to explain the extraordinarily rapid change in the spirit and art of woodworking, as in the other architectural crafts, which took place between the fourteenth and eighteenth centuries.

All manual or productive work is of two kinds, which may be distinguished as the indirect and the direct, or as the preparatory and the creative. To sharpen a chisel, for instance, is work of the first kind; to use it work of the second; to make a door is work of the second kind; to saw the door, or to make any mere instrument of production, such as a mitre-board, is work of the first kind. And corresponding to these two kinds of work there are two extreme types of workmen. There is the enthusiastic and hot-blooded, the foolish and poetic type of workman, who is in such a hurry to get to the creative work that he will spend the least possible time over any preliminary operation, and that not till the last possible moment. He will sharpen his tool till he actually needs to use it, and make no working drawing nor waste his time upon any time-saving contrivance if he can possibly do without it. And there is the conscientious and methodical—shall I say the diplomatic or the saucy?—type of workman, who has realised that time well spent in preparation may be more than saved in the actually productive work, who makes sure that his tools are all sharp and in order, his working drawings and templates complete, and every possible labour-saving expedient considered and prepared before he touches the wood at all; who cuts out all his parts before he begins to plane them, and fits them all together before he will carve or mould them, and who adheres strictly throughout to his working drawings, whether they are his own or another's. These are the two extreme types of what I may perhaps call the natural and the civilised craftsman: the one with his attention wholly fixed on the end desired, and working directly to that end with such few and simple tools as he already possesses; the other constantly considering the means to be adopted, and working therefore with continually more numerous and complex instruments; the one wholly possessed by his conception, the other equally content so long as it gives him an opportunity of using his latest and most ingenious tool in working at that of another man; the one, therefore, freely and fully expressing himself in the finished product of his labour, by which alone he is finally judged; the other expressing himself, by the way, in many practically unrecorded activities, and producing finished work of a less human and individual character because of the more specialised and mechanical nature of the tools employed.

The moulding plane which has been so much used on these last two doors is a good example of what I mean by a highly specialised tool. I do not know the date of its introduction, but it was certainly long subsequent to the introduction of mouldings. Look again at the old pew ends at the old pulpit, and you see that they are covered with mouldings for which the moulding plane could not have been used at all. For the moulding plane can only move in a straight line, and cannot very well be stopped until it gets to the end of the wood. It might have been used, for instance, to cut the moulding on this rail, but not that on the stile, which must have been cut with chisels and gouges, in order to turn the corner in that way. Indeed, the whole thing is obviously the work of men who were quite content, on the one hand, with these simple tools, and whose heads, on the other hand, were so full of patterns that no two of

the carved panels, nor of the vertical moulded ribs, are anywhere of the same design. And though you will probably not think that any of the detail is as good as it might be, you will all admit the charm of mingled richness and rudeness, the vast amount of individual character, that there is in the whole effect. The expression of character is direct. It is impossible to imagine that this pulpit was designed by any but the man who made it, or that full-sized working details were drawn out even by him. Rather it grew as he worked at it, and his work was spontaneous and direct. He had not studied nature, this man, nor had he been taught design, but he seems to have been born with the tools in his hand, and ever since to have been dreaming of leaves and feathers, and knotted tree trunks, and half human, half bird-like inhabitants peering at him from between the branches. Except, perhaps, in this one panel, which seems to be of later date, he worked mainly to please himself, with the result that the whole thing is alive and still instinct with the soul of its forgotten author.

This fine old door (South Kensington Museum, 18,261), also French, is of about the same date and of very much the same character, but there is one premonition of the coming change in that the plough has apparently been used on the framework of the door in the capacity of a moulding plane, though the device of making this mechanically-cut moulding continuous by means of mitreing has not yet been attempted.

In this seventeenth-century panelling (South Kensington Museum, 19,305) and in this next (20,041), an eighteenth-century door, it is clear that a complete change has come over the spirit of woodworking. This change may be partly explained, or shall I say more fully described, by saying that the craftsman has begun to prefer the more complex and highly specialised to the simpler tools. He has begun to realise that time spent on the preparatory stages of his work may often be more than saved in the actually creative processes; he has learnt to work with a deliberate and increasingly elaborate adaptation of means to ends in which his genius has more than half expressed itself before the work of creation begins. He has found, for instance, that if he buys or makes himself a moulding plane he can cut mouldings of a certain kind very much more quickly and accurately than he could do with the gouge and chisel. And, since his moulding plane will not go round a corner, he has begun to mitre his mouldings. And for this purpose he finds that he wants a mitre-box and a specially fine-toothed saw; and that even then his mitres have to be planed, so that he must make himself a mitre-board, and for that, again, a particular sort of plane.

Now all this has an effect on the craftsman's character. Between the use of a moulding plane and of a gouge or chisel there is all the difference between work and play. Leave a man with a sharp chisel alone in the same room with a sharp-edged rectangular board, and he will be just as irresistibly moved to attack the sharp edges of that board with his chisel as the boy to notch the edges of the school desk with his knife. To hack with something—with anything—at all sharp edges and corners is an instinct of the human race. But I do not think I ever yet met the natural man who was irresistibly attracted to the use of the moulding plane. The moulding plane is a very different instrument from the pocket-knife or the chisel. These latter a man can use very effectively for a short time in a certain way, and then use them quite as effectively in some other way, or, if he is inclined to be lazy, stop using them altogether. But when he begins to use the moulding plane on the sharp edge of his board, he must either at once or in a succession of strokes go the whole length of that edge; and he must go the whole length of that edge many times, his moulding plane traversing always exactly the same path at exactly the same inclination to the face of his board, to produce an effective moulding. This is something very like hard work; and when the moulding is cut the workman—unless he also made or designed the plane—has not expressed himself, except, if he has been successful, by his fidelity to the conception of another man. His work has been mechanical, and the result is highly mechanical as compared, for instance, with the richly-cut ribs of the French pulpit. And before he can make such a door as either of the two last—for the sake of brevity I will call the section of Jacobean panelling a door—this mechanical operation has to be many times repeated; and, worse than that, his plane will have to be frequently sharpened. To sharpen a knife, a chisel, or a gouge is a simple and by no means a disagreeable task, but to sharpen the iron of a moulding plane so as not in the least to alter the delicate contour of its edge, which

must everywhere project exactly the same small distance beyond the shaped sole of the plane is the task of the mechanic, a slave—or shall I say of a saint?—rather than of an artist and a free man. Of the true artist, as of the poet, we must say that he is born, that he is not made, but the exact contrary is true of the kind of artist who can turn out such doors as these. Not only the cutting of the mouldings, but the mitreing of their corners, whether “stuck” as in the one door, or “planted” as in the other, and the construction of the whole door is mechanical, unimaginative and tedious to the last degree. And it is especially interesting to notice—only in looking at the photograph of these panellings I did not at first notice sufficiently—how this mechanical and unimaginative character of the craftsman which is fostered by the use of such instruments as the mitre-board and the moulding plane comes out also when he handles—or wishes it to appear that he has handled—the superior tools; for his attempts at decoration on the Corinthian pilasters and on the central panel (S.K.M. 19,305), which, as far as the tools are concerned, might have been freehand, are just as hard and monotonous as his plain flat panels and his painfully cut and mitred mouldings. Even his patterns do not express the man, but have obviously been traced and repeated—so at first I thought—from the full-sized drawings of some academic designer. But here perhaps I did an injustice to the academic designer, and I certainly underrated the sophisticated ingenuity of the artisan; for on looking more closely I see that very little of this decorative work has been done with the carving tools at all; it has been cut out with a fret-saw and glued on to the structural members, some of the rosettes only having been afterwards carved so as to heighten the artifice by which I was at first deceived. And here, you see, some of this applied ornament is peeling off, in obedience to the natural law which always at last exposes the artificial and insincere.

So far I have only partly explained this great change which has come over the spirit of woodworking. I have been careful to give the technical explanation only. I have explained it as a tendency to the specialisation of tools, the elaboration of means and methods, the spending of thought and time and energy on preparatory rather than on creative processes. I have said that the craftsman expresses himself in the instruments, the by-products of his activity, rather than in those more enduring results by which alone he is finally judged, since these are all the while the true end of his labours; and that the finished product of his work would be naturally less human, less richly interesting, more formal and mechanical, merely on that account. Whether or not the later work is also less beautiful is perhaps a question of individual taste. A great deal of beautiful work, especially in furniture-making, was done during the seventeenth and eighteenth centuries; and, speaking generally, I do not wish you to think me prejudiced in favour of Gothic as opposed to Renaissance art. I only ask that all art shall be natural and good; not consciously—it can never be that—but quite unconsciously the expression of character, as undoubtedly is the work of the great painters and sculptors of the Early Renaissance period; and as often was that of the eighteenth-century furniture-makers when they used their improved appliances to produce work which was not cheaper, but really better and more useful than that which had gone before. And so far I have only said that the specialisation of tools has a strong tendency to make this expression of character less direct—the finished products of the tool less human and alive. But I do believe, too, that the arts are well called the “humanities” and that the more beautiful of two works of art is always the more human or humane. Everywhere and in everything, in our houses and in our furniture, as well as in our books or our friends, I believe it is life, it is soul, which we look for and by which we live. I believe, therefore, that the change which I have traced in the art of woodworking is decadence—is a change for the worse. And if you agree with me, and if you are content with the explanation I have tried to give—if we assume that the craftsman as a free agent has been himself responsible for the tendencies I have just described—then we must believe that every art contains in itself the seeds of its own destruction. This, however, is not only a most unhappy, but a most unwarrantable conclusion. This rapid decadence of the crafts which has characterised the western civilisation of the last four or five hundred years is anything but a normal phenomenon. In Egypt and Asia the industrial arts have often flourished for untold centuries, or even thousands of years, without any such signs of

diminished life and energy as have been traced in these illustrations. And to come nearer home, here is a Norwegian chair of the tenth century (South Kensington Museum, 23,713) and here a Norwegian butter-tub of the eighteenth century, and the spirit that breathes from these two lovely works, separated though they are in date by 800 years, is so nearly identical, their difference of functions allowed for, that they might almost have been made by the same man. Here, on the other hand, is a French chair (the ugliest thing I could find in the South Kensington Museum, 26,488), of almost the same date as the beautiful French door, but instinct and hideous with an utterly different feeling, which since it is carved all over, and must at that time have been carved by hand, cannot be wholly accounted for by the specialisation of instruments.

MODERN ARCHITECTURE IN GERMANY.*

IT is with great diffidence that I venture to lay before you some views of my own on the modern development of architecture in Germany, feeling that, as it is not possible to give a comprehensive survey of the domain in question, I must be content to submit to you my conclusions without enabling you to judge whether they are sufficiently supported by facts. I am encouraged, however, by the belief that it may be of interest to hear upon this subject the opinions, not of an art historian, but of an architect who has himself passed through some of the phases of modern architecture and who has felt the influences that have led to many of its changes.

Now, the future of architecture as a fine art is inseparably bound up with the vexed question of architectural style, and with regard to the development of style a review of what the past century has produced would not, at the first glance, seem to encourage a very bright outlook on the future. There is no doubt that much of the best artistic power of the nineteenth century was wasted in fruitless search for style in architecture and the industrial arts adapted to the age. Though the great inventions of that century brought about a more rapid and frequent interchange of thought between nations than was ever possible before, we have seen in our own time, as a consequence of these fruitless endeavours, a greater diversity in the architectural aspect of Europe than there was at the beginning of the eighteenth century. No one country has been able to establish an acknowledged supremacy in architecture, as when France at the commencement of the Gothic period, Italy during the Renaissance, and France again in the eighteenth century, took the lead, and was more or less closely followed by the rest of Europe, nor does at present any such supremacy seem to be in prospect.

It seems strange indeed that a century which has contributed more than any other in the world's history to the advancement of science, and which has been so fruitful in inventions that have immeasurably increased the wealth and power of mankind, should have been stricken with barrenness in this one domain of architectural inventiveness. We architects are accustomed to be asked reproachfully why our age has produced no style of its own, as former periods have done, and we are often told that our art has fallen from its high estate, and that the best among us have sunk to the part of more or less conscientious copyists. In my opinion this reproach is unjust, and the chaotic state of modern architecture may be accounted for without assuming that our architects have been lacking in the inventive qualities possessed by former times. The unsatisfactory state of things in the nineteenth century has been brought about by two causes. First, by the destruction of an ancient society and an old accumulation of wealth by the French revolution and the Napoleonic wars, and secondly, by the sudden growth of a new society and new wealth acquired for the world by the introduction of steam-power and the inventions which followed in the wake of this great innovation, bringing about a sudden demand after a long standstill—a demand to which the artistic inventiveness of no age would probably have been equal under the given conditions.

At the commencement of his reign His Majesty decided that the buildings to be newly erected in Berlin for the Crown and for the State should be designed in a style harmonising with the noble architecture of the royal palace and of the arsenal.

* A paper on “The Development of Architectural Style in Germany,” read at the opening of the enlarged Carnegie Institut at Pittsburg by Herr Ernst E. von Ihnen, court architect to the Kaiser Wilhelm.

Not only the designs for these buildings, but all those of great importance, for all departments of the State, are now regularly submitted for his approval and are influenced by his wishes. Continuity of effort I believe to be the principal condition of progress in architecture, and I consider my country to be most particularly fortunate in possessing in this critical period a far-seeing patron of art so powerful as to insure steadiness of purpose as far as monumental architecture is concerned.

It is therefore a hopeful view that I take of the future development of German architecture, and there can be no doubt that in Germany the misfortunes that caused artistic decline in the nineteenth century had a more disastrous effect than in any other country, for none had suffered so severely from the great European wars in England and France. Political unity has brought about greater artistic unity. As far as I am able to judge, the development of style in both countries has been following lines almost parallel to our own, the result of a century's trial given to different styles being a decided leaning towards the Classical architecture of the eighteenth century based, as with us, on a more complete understanding of that style, and therefore on a greater mastery of the possibility of a greater freedom of treatment than ever nineteenth-century architects attained to who attempted to work in the style of a former period.

I may sum up my argument by saying that in my opinion there has been in the history of architecture a progressive, though sometimes interrupted, development of style as an expression of the architectural requirements of society from the fifteenth century up to the nineteenth, and that in order to progress still further we must start from an advanced point that had been reached before the continuity of progress was interrupted. Yet if we would not stand still we must constantly work at the adaptation of old means to new wants which have arisen and are arising in our time. In Domestic architecture much has been done in this respect, especially in England, and of late years in Germany. But in no country is progress more likely to be brought about in this way than in the United States, where architects have already shown themselves well able to grapple with new architectural problems arising from new requirements, as in your admirable libraries, or from new methods of construction, as in your giant commercial buildings, and where the opportunities offered to architects are more frequent and the means at their disposal greater than in any country or in any age. The advancement of art has always been promoted by the peaceful rivalry of nations, and I therefore feel sure that the art of European countries can only gain by our finding, as we certainly shall, in the United States of America, a competitor as formidable in the domain of art as they are in commerce and in industry.

Herr von Ihnen expressed himself as follows to a *New York Times* reporter on the kindred topic of architectural development in this country:—

I see the greatest hope for a magnificent architectural future for America. You are at work meeting conditions. That is the thing that architects have always to do. No nation can achieve a national architecture whose artists say, "Let us build in the Gothic style," or, "No, let us build in Romanesque; that is better." A country has simply to begin and build; it will start with what style it believes best suited to its particular problems, but it will develop just as it appreciates its needs. I have my idea as to what historic style is best suited to be the foundation of your architecture, but you may find another to be the best one. That doesn't matter. The point I make now is that you in America are earnestly striving to meet the particular problems of buildings fitted for dwellings, business houses and public halls in America—problems different in many respects from any hitherto attacked by architects—and you are meeting these problems with a surprising degree of success, considering how brief has been the time during which you have been at it.

New York is most impressive in the daring and unhampered spirit in which it is thrusting up its gigantic fabrics into the air. Consider, whoever before undertook to erect what is almost a city under a single roof on such a plot of ground as that on which stands that "Flatiron building"? And how brilliantly you have dealt with a similar problem in the *Times* building.

You do right, precisely right, to treat these tall buildings frankly as towers. That is exactly what they are. Already you have the campanile of Giotto standing in the most conspicuous point along your thoroughfare, and,

I believe, other great towers reproduced in various parts of the city.

Your problem has been to make the most of every inch of land. The concentration of the people in the city has brought conditions from which architects of former years have been free.

I must say that I believe the limits of high buildings will soon be reached and that their multiplication will soon cease. You are closer possibly than you think to the point at which it will be impossible to transport more people to and from their work. It is all very well to have these immense towers here and there, and perhaps gathered in considerable number in some parts of a town. But if the streets are to become great canyons lined with solid blocks of towers it will be eventually impossible to get their inhabitants in and out. Then the question of daylight will be one incapable of solution. You will, I think, find it advisable and necessary to limit the height of buildings, as we do generally in Europe.

But to return to the question of style. People often ask why we have no style to-day, why we are all adrift as to the most elementary principles of the art and reveal so often the most execrable taste?

The reason, I believe, is this. Until within the last few years architecture has had no chance. The nineteenth century was one of war and of disturbed social and political conditions and of general poverty. All the arts suffered, and especially did those which require large outlay suffer. Not only were no great buildings erected, but men forgot how to build, and when we began again it was in ignorance and forgetfulness. The result was the horrible warnings which exist on every side. If only the tradition of good building had been remembered we should have been spared all that.

Now that we are prosperous again and minded to build, we shall do well if we go back to the eighteenth century and begin again where architects left off. Why begin at the beginning? Why puzzle again over the problems which earlier centuries have definitely settled? I consider that there are certain things pretty well determined in architecture. The sixteenth century definitely discarded Gothic as a style for domestic or commercial architecture. Conditions of life have altered since the days when Gothic was properly employed, and it is mere slavish imitation to build in it now. I do not speak of ecclesiastical architecture. Religion is essentially unchanging, and its aspirations express themselves in forms permanent and stretching from age to age. But domestic life is not to-day what it was in the Middle Ages, and commercial life in its modern sense is a new thing in the world.

My belief is that the world was right in agreeing, as it did, that the Classic form was the one which might best be progressively adapted to the needs of modern life. In the eighteenth century it had reached the highest development, for its purpose, of the Classical style. My feeling is that we are wise in going back to that point, not to rest in its achievement, but to progress from it, having in mind always the necessity of studying our particular problem and in dealing with it freely and creatively, yet with intelligence informed of the history of past architectural endeavour.

The information is acquired. The creative spirit is more a native gift. It is the evidences of it that fill me with confidence that great architectural triumphs will be wrought in this land of the West.

Acoustics of Churches.

SIR,—From a lengthened experience in church work, it is difficult to suggest a remedy for the defect mentioned by your correspondent "Inquirer" without viewing the building. What proves a success in one case is a failure in another. One requires to know the form, height, width and length and seating capacity of the structure.—Faithfully yours,

26 Budge Row, Cannon Street,
London, E.C. : May 28, 1907.

SIR,—It is a pity "Inquirer" is not more precise concerning the "Gothic church with a high roof." Apparently he imagines that acoustics can be treated like ventilation or heating, and that it is only necessary to adopt some

special apparatus in order that the whispers of a preacher should be heard. My notion is that the high roof is too high and that the voice is lost, as it were, among the timbers. There is no doubt that similar defects in old Gothic churches led to the introduction of sounding-boards, which are equivalents for low roofs in particular spots. A high roof suggests a desire to be exalted, and who knows whether "Inquirer's" pulpit is not too high?—My own experience is that there are mysteries about acoustics which are not easily understood. I was once consulted in a curious case. There was a large hall which I tested under a variety of conditions, and found there was no difficulty in making myself heard. But in the committee-room adjoining, if I stood at one end I could not hear the architect at the opposite end and he could not hear me, however clearly I addressed him. I suggested a temporary remedy which answered, and as the building became older there was no difficulty in the room. It is not considered polite to tell a clergyman that the acoustic defects are really owing to his manner of speaking, but I am sure that very often indistinct elocution is the *fons et origo malorum*. Anyone who is acquainted with actors must know many of them who in private conversation appear to have very weak voices, yet without any distress to themselves they can be heard in the standing places at the back of the top gallery and in nooks and corners throughout the house. It matters little whether the building is old or new, expensively or cheaply constructed, they can always conquer the difficulties which may exist. I would advise "Inquirer" before he undertakes any alterations to try experiments with his clergyman. It may be found that the pulpit is far too high, and that by speaking at a lower level more distinctness will be attained. Some clergymen have also a habit of appearing to address the roof instead of the congregation. It may appear irreverent to offer such a suggestion, but there are cases of alleged acoustic defects which would be remedied if a member of a strolling dramatic company were invited to give a few lessons to the preachers.—Yours truly,

A PRACTITIONER.

GENERAL.

Sir Aston Webb, R.A., is to deliver at Cambridge the Rede Lecture on June 8, when the subject will be "The Art of Architecture and the Training Required to Practise it."

Sir Thomas Drew, P.R.H.A., has designed the memorial to the men of the Royal Irish Regiment which has been placed in St. Patrick's Cathedral, Dublin. It consists of a Celtic mural cross 9 feet high, with a background of mosaic and an inscription tablet.

A Congregational Church is to be erected at Ewhurst, Surrey. Mr. Wm. Theobalds, 26 Budge Row, Cannon Street, E.C., is the architect.

The Deschaumes Prize has been awarded by the French Académie des Beaux-Arts to M. Gabriel Aubrée, architect, a pupil of M. Pascal.

Zaccharia Astruc, the artist, who had taken part in the Romantic movement, has died in Paris. He was not satisfied with working as a painter, sculptor and poet, for also he made a business of agriculture.

It is Stated that 136 architectural firms are to submit plans on June 15 for the building for the Bureau of American Republics to be erected at Washington. The cost of the building complete is not to exceed 600,000*l*.

Rutherglen School Board are about to advertise for plans for a new school to be erected in Hamilton Road, in the east end of the town. The building is to hold about 1,500 scholars. The population is at present increasing, and it is expected that this school will be urgently required before it is ready.

The City Board of Guardians received on Tuesday the plans of the new workhouse and infirmary to be erected at Homerton, previous to their being submitted to the Local Government Board for formal approval. The estimated cost was stated to be:—For the main scheme, 67,691*l*.; for lunatic block, which the committee recommend remain in abeyance for the present at the wish of the Local Government Board, 4,660*l*.; total, 72,351*l*.

A Statement having been put in circulation to the effect that a reserve price of 70,000*l*. has been put upon Glastonbury Abbey estate, which is shortly to be offered by auction, it has been officially stated that no such reserve has been contemplated. The reserve, it is announced, will be reasonable and moderate, taking into account the unique character of the property and the fact that it is perhaps the most historically interesting ruin in the country.

In Convocation at Oxford on Tuesday the honorary degree of D.Litt. was conferred upon Commendatore Giacomo Boni, director of excavations in the Roman Forum, and Mr Frederic D. Matthew.

The Glasgow Institute of Architects have unanimously agreed to confer honorary membership of the Institute upon Principal Macalister of Glasgow University.

The Late Mrs. Ismay, widow of the founder of the White Star Line, in her will provides for carrying out her undertaking to furnish the principal window at the chancel end of Liverpool Cathedral as a memorial of her late husband and expresses the desire that in design and execution should be as perfect as possible.

The Kits Coty Estate at Aylesford, near Maidstone, is for sale. It includes the monument commemorating the victory of the Britons over Hengest and Horsa, A.D. 455, and in memory of the British Prince Catigern, who was slain in the great fight on the estate.

The Institute of Archaeology of the Liverpool University has arranged an expedition into Asia Minor to explore the sites of Hittite monuments and to make excavations among some ruins near one of the ancient trade routes, where several Hittite inscriptions have recently been found. The party started from rail-head at Angora on May 11, and expect to cross the Taurus mountains about the end of the month.

The Meeting which was expected to be held in Edinburgh during the sittings of the General Assembly to make representations in favour of the carrying out of the bequest of the late Lord Leven and Melville to restore Holyrood Chapel will not now take place. The money left by the late earl has, it is said, all been distributed, so that the bequest as such does not now exist. Hopes are, however, entertained by some that the question of the restoration may be brought up again in some other way.

As a Memorial to the late Miss Mary E. Christie, the founder of the Art for Schools Association, it has been determined to commemorate her life and work by presenting to a number of schools in the poorer districts of London and of other populated cities a series of carefully chosen pictures, on the frame of each of which there will be a suitable inscription.

A Picture by Domenico Theotocopuli, surnamed El Greco, sculptor, painter and architect in one, was sold last week at Christie's. His *Christ at Calvary*, 64 inches by 38 inches, belonging to Señor Don Alberto Gonzalez-Abreu, of Seville, fell to Messrs. Vicars at 1,900 guineas. The artist was born at Crete between 1545 and 1550.

Mr. John Belcher, A.R.A., will publish in a few days, through Mr. B. T. Batsford, a small book entitled "Essentials in Architecture; an Analysis of the Principles and Qualities to be looked for in Buildings." Being intended for all interested in art it is designed on popular rather than technical lines, and is illustrated by many fine examples of architectural art.

The Society of Architects received twenty-three sets of designs in the Travelling Studentship, 1907, competition, and the Council has awarded the first place to "Mac," and honourable mention to "Celer," who receives a special prize from the president (Mr. Albert E. Pridmore). The names of the successful competitors are:—1. Travelling Studentship (25*l*. and silver medal), Mr. J. Drummond Murdoch Edinburgh. 2. Honourable mention (President's prize), Mr. Hubert Savage, Muswell Hill, N.

The Plans for the restoration of the main building of the Merchant Venturers' technical college, Bristol, have now been approved by the society; they involve very considerable changes in the arrangements of the original building. It is expected that the whole of the work of restoring and refitting will be completed in time for the students to return to the main building in September 1908.

Messrs. Giles, Gough & Trollope, architects, referring to the statement made by Mr. Burns in the House of Commons on May 13, that the cost of the Hammersmith workhouse and infirmary was 335*l*. per bed, state:—"Such a statement without qualification is misleading, unfair to the guardians and calls for a public explanation. This cost of 335*l*. per bed is calculated on the present accommodation for 758 inmates, but with administrative buildings, kitchen, laundries, &c., for 1,456 inmates. The necessary blocks for the additional 698 inmates will cost 80*l*. per bed, and when these are erected the cost of the Hammersmith workhouse and infirmary will be 183*l*. per bed."

The Architect.

THE WEEK.

THE exhibition of Spanish pictures at Messrs. WARING'S Antique Galleries consists of about ninety works, varying in merit. The Guildhall exhibition of Spanish painting was most successful, for to many it was a revelation. But the Waring exhibition, although on a smaller scale, may be considered as supplementary to it.

In both the influence of VELASQUEZ is apparent. In CHICHARRO, in his *Cupletista Española*, rivals the French painters in expressing the weird effect of the spotlight on a performer. *La Feria de Santiponce*, by FERNÁNDEZ NAJERA, suggests the joy which is still retained in fairs as an occasion for merrymaking—their itself is wisely kept in the background. Sheep are often represented by English painters, but none of them have attained the peculiar decorative effect of Don JORRA in his *La Vuelta del Rebaño*—the flock extends right across the picture, and the difficulties of foreshortening are courageously overcome; the artist is a master of animal painting. *Puesta del Sol*, GÓMEZ GIL, shows the effect of sunset on a desolate landscape; the colour is laid on with great vigour. SOTOMAYOR'S *Corrida de Pueblo* is interesting as a representation of the pleasure of villagers in a bullfight on a small scale. The water-colour paintings, though differing in treatment from English drawings, are most effective. For architects the collection of antique furniture, tapestries, silverwork and ecclesiastical accessories by Spanish and Italian craftsmen is likely to have greater attraction. All the examples have been selected with judgment. A few lead figures are admirable specimens. In fact, the whole of this part of the exhibition deserves to be bodily removed to one of our museums. The Spaniards were not sparing of money when a work was required in a church, and many of the specimens must have cost originally large sums to produce. The catalogue from its numerous illustrations is worth preservation. Several precious examples of early Flemish art are also to be seen in the series.

ONE of the committees of the Liverpool Corporation are now a delicate subject to consider. The art gallery provided by the late Sir A. B. WALKER is one of the best-known buildings in the city. If a building can be regarded as a success it is this; for the wall-space is now insufficient for all the paintings which the Corporation possess. But the gallery has to serve a twofold purpose. Every year there is an autumn exhibition, in which many of the most successful pictures in the Royal Academy and other London exhibitions are brought under the notice of the citizens. There are also occasional exhibitions of a special kind. To accommodate the temporary occupiers the permanent collection has to be disarranged. Mr. E. P. THOMPSON, recognising the inconvenience, has offered 500*l.* towards the erection of galleries at the back of the Walker Art Gallery, which would be used mainly for the autumn and similar exhibitions. The cost is estimated at from 600*l.* to 20,000*l.* It appears the WALKER family must have a special interest in the existing building, as they are not disposed to favour such an addition as is suggested. Besides, the addition could hardly pass as a part of the Walker Art Gallery, and the familiar title would then become a misnomer. There is, however, a great inconvenience caused by the want of sufficient space to display all the pictures which are forthcoming, and the only way to meet it is by the erection of additional galleries.

DURING several years the *Norwich Mercury* has given a description every week, with an illustration, of one of the old churches in Norfolk. The work has been done

by Mr. T. HUGH BRYANT with a care that is remarkable in times like ours. It is not only the peculiar features of the church which are described, but its history is investigated, and the whole will therefore form a collection of ecclesiastical annals of a unique kind. Archaeologists must envy the enthusiasm which has done so much for Norfolk, and it is to be desired that a similar series could be produced in all the remaining English counties. Already 444 churches have been described. A large newspaper is not adapted for reference, and the proprietors of the *Norwich Mercury* have brought out the "Churches of Norfolk" as a separate publication, in parts of a size which is adapted for ordinary libraries. But the enterprise has not received the support which it merits. At the annual meeting of the Norfolk and Norwich Archaeological Society it was announced that unless 100 regular subscribers are forthcoming who are willing to pay 3*s.* 6*d.* a part the publication in book form must be stopped. That would be nothing short of a catastrophe in archaeological literature. The work is of unquestionable importance; the churches possess historic as well as architectural interest, and the accurate records of whatever relates to the history of families which appears in the parish books should appeal to people in all parts of the world who claim relationship with Norfolk worthies.

ALTHOUGH the disposal of the site occupied by the Manchester Infirmary is not yet finally settled, there is little doubt that eventually the place will be an ornament to the city. A quarter of the site will have to be utilised for the widening of the streets, which at that particular point will serve for the junction of tramway lines. The special committee of the Manchester Corporation who are investigating the subject consider that a building should be erected at a cost of about 250,000*l.*, which would serve as an art gallery and a public reference library. About one-half of the site would thus be occupied, and the remainder will probably be laid out as a public garden, which would be a desirable variation from the streets of Manchester. The special committee before coming to a final decision will consult other committees, and in that way may be able to obtain suggestions which will produce a result satisfactory to all.

It is astonishing under what various circumstances the name of LEONARDO DA VINCI is referred to as an authority, although with a man of such extraordinary versatility nothing ought to surprise us. One of the last places where we should expect to have him introduced would be at a meeting of the Indian section of the Society of Arts, with such a subject for discussion as "The Applicability to India of the Italian Method of Utilising Silt." Yet we find Sir E. C. BUCK, K.C.S.I., the author of the paper on the subject, when describing how the Italians use the waters of a river as a weapon of defence against the destructive and pernicious influences of the very river itself, acknowledging the obligations of irrigation engineers to him. He says:—LEONARDO DA VINCI, whose genius as an engineer was even more remarkable than his skill as a painter, had been among the first to point the way. The heading of the fifty-third chapter of his great treatise on the "Movement and Measurement of Waters" is "How with the running waters we ought to carry the earth of the mountains into the valleys, so as to render them fertile and to purify the air." In his letter of application for employment with the Duke of MILAN, DA VINCI suggested his practical acquaintance with hydraulics, for he said he was able to drain the ditches which were filled with water for defensive purposes. The Italians have long utilised silt, but hitherto its value has not been sufficiently recognised by official engineers in India. Apparently it can only be employed with advantage in certain districts.

AN ARCHITECT'S COSMOGONY.

EVERYONE remembers Dr. PRIMROSE's surprise when an old man in the little back-room of an ale-house said to him:—"The cosmogony or creation of the world has puzzled philosophers of all ages. What a medley of opinions have they not broached upon the creation of the world! SANCONIATHON, MANETHO, BEROSUS and OCELLUS LUCANUS have all attempted it in vain. The latter has these words, *Anarchon ara kai atelutaion to pan*, which imply that all things have neither beginning nor end. MANETHO also, who lived about the time of NEBUCHADON-ASSER (ASSER being a Syriac word usually applied as a surname to the kings of that country, as TEGLAT PHÆL-ASSER, NABON-ASSER), he, I say, formed a conjecture equally absurd; for, as we usually say, *Ek to biblion kubernetes*, which implies that books will never teach the world." If an imitator attempted to pose as EPHRAIM JENKINSON in our days he would be likely to include the name of DANIEL RAMÉE with the ancient speculators.

RAMÉE was the son of the architect of the colossal Autel de la Patrie which, amidst the excitement of the French Revolution, was erected in fifteen days in the Champ de Mars of Paris. At least 15,000 Parisians of all classes were engaged on it under the elder RAMÉE's direction. In spite of his patriotic services, he had to fly from the guillotine to Germany, and his son, the cosmogonist, was born in Hamburg in 1806. As a deep scholar in all that related to architecture, the Commission of Historic Monuments utilised DANIEL RAMÉE's services. If the truth were known, PROSPER MERIMÉE, VITET and others got the whole credit for archæological works in which he largely co-operated. His position is the more remarkable because although as an official he endeavoured to preserve examples of French Gothic and to create interest in them, he maintained that the thirteenth-century cathedral was not a Christian conception nor was it, except in very rare cases, the work of bishops or monks, but of laymen. DANIEL RAMÉE was the author of a general history of architecture and of several other treatises on the art. For the present, however, we propose to consider only his "Théologie Cosmogonique, ou Reconstitution de l'ancienne et primitive Loi," and that only in connection with some of the author's views concerning architecture.

Unlike many of those who have attempted to investigate the most difficult of problems, RAMÉE declared that the world owes its origin to an act of the will of God and His unspeakable love. The first manifestation was a "Voice," which appears to have corresponded to some extent with the "Word" of the Evangelist and of the early Christian metaphysicians. RAMÉE is not, however, so much concerned with the creation of the material globe as with the creation of society, and his work is sociological rather than theological. As regards man, he is indifferent to theories of development like those of LAMARCK, or of DARWIN at a later time. Unlike some recent theologians who have followed SPINOZA, he avoids identifying the Creator with His creations. The Superior Principle, he says, is not identical with matter; it simply is connected with it as the architect is with the monument, in order to impart to it the characteristics which it is to manifest.

Having started in this way, with created man at what would now be considered an advanced period of evolution, RAMÉE has faith in the Divine government. He sees it exhibited not only in material things, but also in the continued existence of the three great families of the human race, viz. the Caucasian, the Mongolian and the Ethiopian. It is with the Caucasian alone RAMÉE professes to occupy himself. That race—or the "race blanche"—is said to have two varieties, viz. one consisting of Indians, Egyptians, Germans, Celts, and especially Greeks and Etruscans, who were and are laborious, peaceful, gentle, obedient, self-denying, and to whom we are indebted for all the inventions and improvements found to be most useful to men. The

second great variety of the Caucasian race is inferior kind. It detests manual labour; it is unceasingly irrational, impetuous by intervals, warlike by moré, careless of exact observation, disposed to mysticism, fanaticism, superstition. One time it carries religious excess, another time it is atheistical. It prefers a life of living which recalls the wandering life of the nomads to the settled occupations which belong to civilisation. In this peculiar variety he includes the different Semitic races. All through his cosmogony, whenever Semitic influence is mentioned, it seems to be introduced by the spirit of AHRIMAN endeavouring to obstruct, not to confound, the organised life of the rival Caucasian race.

One of the results of the opposition is traced in RAMÉE in the history of architecture. The family of the earliest constituent element of the universe, and the Golden Age as exhibited by the early Greeks and early Germans consisted of a large number of independent families or units living peacefully apart, with or less free space between the constituents of organised settlements. As the world became more populous the intervening spaces were diminished. The early cities were, however, made up of habitations which resembled cottages erected within boundaries that were laid out on geometric principles, and were believed in consequence to resemble the heavenly bodies in their regularity. They were intended to establish a relation with remote parts of the universe. The ancient Greeks and the Etruscans, as shown, adopted a square form; it was repeated by ROMULUS in "Roma Quadrata"; it determined the form of the temple and its enclosure, and even the life adopted it. Unfortunately for the peace of the world there was an inroad of the Semitic race, whose houses of four and five storeys were erected for the shelter of men of disorderly habits, and who, through their perfidious egotism, preferred independence to a common life in a big outhouse.

RAMÉE is positive that the early Greeks and Etruscans, while having a reverence for the sky, did not believe in the rotundity of the earth, although such a theory is not supported by HOMER or other ancient authorities. He points out that the subterranean treasuries in Greece, in which the wealth of the people was deposited, were on a circular plan and vaulted, and were as nearly globular as possible consistent with utility. The keystone of the vault was called *harmonia* in order to suggest the universal harmony in which all things were united by the Deity. The Temple of Vesta in Rome, which NUMA erected, was also of a spherical form.

There was one class of people in Greece which never assimilate itself with the others. The Dorian or Spartans—and the Thessalians may be added to them—were, according to RAMÉE, Semite invaders who were able to impose their will upon the native peaceful inhabitants, and to hold them in slavery, compelling them to provide whatever was needed for the support of the tyrants. Their influence was pernicious, for although an order of architecture was introduced after them, all the researches in the region occupied by the Spartans have failed to discover a work which has any value for its beauty.

As we have said, RAMÉE was the son of the architect who directed the enthusiastic Parisians in the construction of the mighty Altar of Federation. It is remarkable that when speaking of the great buildings of antiquity he contends they were merely expressions of the same spirit which animated the preparations for the fête of July 14, 1790. They were, he says, but simple amusements of populations, *diapasons* of architecture which were combined to produce edifices which would serve for the general pleasure. The Egyptian paintings which represent workmen labouring under the lash, overseers who used sticks and scourges vigorously, do not support RAMÉE's theory; and it is doubtful whether with such grim rulers as are represented in the Assyrian

efs the populace would dare to give way to hilarity the Parisian patriots. But in working out a theory o vast a kind allowances should be made if the laws vidence are not strictly observed. Moreover, it is dly fair to a theory which is supposed to be mainly logical to consider only one application of it.

The Etruscans probably were more free than the ptians. According to RAMÉE they came from ace and Thessaly. They find great favour with him, they inherited and preserved ancient customs which e much to do with his theology. The Etruscan soil solemnly consecrated to God, and severe punishment ited all who violated the rights of property. Under direction of an augur the plough on a farm traced eular furrow, recalling the form of the earth. Three rs were formed in the buildings in honour of the ecting divinities, and in other ways ancient rites ailed. When the younger TARQUIN erected a ple of Jupiter in Rome, there were three divisions rder to commemorate also JUNO and MINERVA. WÉE asserts that Etruscan theology was identical a that of the Greeks, as well as that of the Germanic s. About the skill of Etruscans in the arts, there e no question, and there was a manifest resemblance in their style to that of Greece. The appearance he Romans as neighbours was not without its effect n the Etruscans, as the Etruscan manners and oms were influential in Rome. RAMÉE takes ure in describing the resemblances and the differ- es between the ritual of the two peoples. He is otical about many of the Roman legends which are avourable to the Etruscans. He denounces, for ance, the legend of LUCRETIA as a fable; and he en- vours to show that many of the Roman writers were mpetent to understand the ways of the Etruscans. s needless to say that he enlarges on the debt of the nans to the Etruscan architects and engineers, and seems doubtful whether the temple of the Capitol, work of TARQUIN THE YOUNGER, did not surpass the thenon of PERICLES.

With all its greatness Rome was doomed to decline. n came into operation the influence of Christianity, it seems astonishing to RAMÉE that a hundred ions of men of the Caucasian race should allow nselves to be subjected to a Semitic code, which t arose amidst sterile plains and seemed to be oired by them. One cause of his objection is that many early temples, which he looked on as sym- cal, were superseded when Christianity gained ver. The Druidic monuments found in France, ough consisting of detached stones, were not, he says, rary in their planning. They were circular, and gestive of a sanctuary. Stonehenge he regards as a el which would enable the stones of Karnac and bihan to be arranged in the original manner. re was, he says, in the centre of Stonehenge one t stone, the stone of CROM, the supreme deity. A al line on the wall of the cavern of New Grange, Meath, which is repeated three times, served for a lar symbol, for it has an ogham inscription, which nslated as A E, which nearly corresponds with the of the temple at Delphi and signified the Supreme g. The pre-Christian Gauls and Germans are to RAMÉE as superior tribes like the ancient Greeks. But influx of Phœnician, Carthaginian and other Semitic s could not fail to cause deterioration. Not even ARLEMAGNE at the height of his power was able prevent the Jews from having the control of merce, which included the buying and selling of es. Yet RAMÉE has to acknowledge that the Arabs Spain, who were Semites, had erected in Cordova 000 houses, 60,000 monuments of various kinds, mosques, 50 hospitals, 80 schools, 900 public as and 85,000 places of business. Cordova was, he e, the largest and most populous city of Europe in Middle Ages, although it had one defect in its great e market.

We must not, however, forget to notice what RAMÉE

says about the Mediæval cathedral. He finds fault with Gothic in general because it is only an adaptation of Roman work of the period of decline. Any beauty which was found in the style was, however, owing to the lay masters of works, who belonged to masonic lodges in which the traditions of antiquity were preserved. Geometry was recognised, and the triangle, the square, the circle, the cone, the cylinder and the sphere were adopted in the determination of forms, as well as the ratios of one to three, nine, twenty-seven, and so on. The proportions of the universe were respected, and a universal law rather than any Christian rule prevailed. But much was done to satisfy the uninitiated, for, according to RAMÉE, the Gothic architect when a layman did not wish the world to know that he had employed unity, or the triangle, or the circle as sources of inspiration, and he therefore veiled what was geometrical by various subsidiary forms. It is only in France that the thirteenth-century Gothic was carried towards perfection. It became less elegant in England and Germany, and it could never acclimatise itself in Italy. As an example of what can be done by concealing the original idea, RAMÉE points to the church of St. Eustache in Paris, where the abstract and scientific idea is similar, if not identical, with that of the thirteenth-century cathedral, but evidently the exterior robe is entirely Latin or Pagan. As a lay architect he ascribes much disbelief which arose to the fact that, from the beginning of Christianity, the clerics who controlled the churches, not being trained architects, copied basilicas, temples and other pagan buildings which were without any suggestion of spiritualism or mystery. He quotes FÉNELON's condemnation of Gothic as a product of the Arabs, in order to prove that the antique, in spite of its associations, continued to have its votaries among the higher clergy who willingly accepted the influence of the Renaissance.

According to RAMÉE the Renaissance has been for humanity in the west of Europe a second creation of the world. It would perhaps be more correct to say that it was a revelation of the aims of the Greeks, especially in the arts. But our cosmogonist has to own that however gracious and elegant was the architecture of the Renaissance, it was not genuine or veritable because it was mainly superficial. It was an exterior envelope often without any connection with the interior of the edifice. It gained success because when compared with Gothic it seemed to be joyous, varied and capricious. As practised under Louis XIV. it appeared to be grandiose, but it was essentially "bourgeoise." It was well adapted to serve as a spectacle for the masses, and if the cost of Versailles had not been one of the causes of the revolution of 1789, the French people could have glorified themselves on the possession of a palace which was imitated on a small scale in various parts of Europe. In sculpture and painting spiritual subjects were abandoned for realities by the Renaissance artists, and ordinary human nature in that way became a valuable artistic asset.

It is a difficulty with all those who have endeavoured to classify the past to go forward a step and predict for us something about the future. RAMÉE has to own that the Revolution of 1789 was too premature by twenty years. The Revolution of 1848 was in his eyes still more a failure, because those who took part in it were without any idea of a new social synthesis. He sees in France habitations of many storeys, and large areas which are without any. In such dwellings he traces the influence of Canaan, Phœnicia and Arabia, which in a much earlier age had brought contagion on the world in the early cities. What would he have said if he had seen the vertical villages in Atlantic cities? In lofty tenements he believes there is a fatal element, and until the world goes back to the simplicity of a primitive age in its dwellings, there is little hope for it. The Arab or Semitic race he condemns as the chief causes

of the evil which surrounds us, and until the people belonging to it lose their influence, synthetical systems and revolutions will not be efficacious for good. It is a melancholy conclusion and is fit to be classed with the ancient statement that things have neither beginning nor end. RAMÉE was an able man, but his wide study of universal history made him a pessimist, and filled him with a racial hatred that was more suited for a savage than a scholarly architect. He died in 1887.

THE ACCESSORIAL GARDEN.*

THERE are several kinds of gardens, and the horticulturist, like the old apothecary, considers one of them simply for its productive power. Owing to the limits of language the word has to be used as well to describe grounds which are laid out with little regard to commercial fertility, except in the production of flowers and shrubs which give pleasure to all who look on them. For that end it is necessary to supplement nature by something which is artificial. There was truth in the lines of the "Heroic Epistle to Sir WILLIAM CHAMBERS":—

For what is nature? Ring her changes round,
Her three flat notes are water, plants and ground;
Prolong the peal, yet spite of all your clatter,
The tedious chime is still ground, plants and water.

CHAMBERS was supposed to have expressed the Chinese theory that nature affords gardeners but few materials to work with, and that art, therefore, must supply the scantiness. In saying so, the architect was right. Some gardeners have tried to compensate for that scantiness by disposing of vegetation according to extremely regular geometrical figures, by which the grounds assume the appearance of a superior sort of nursery. But the human mind is so peculiar it soon grows tired of the spectacle of applied mathematics. SYDNEY SMITH tells us that when he first saw in some grand country-place grounds which were laid out with perfect taste he was altogether enchanted, but after three days he became tired to death. "I used to escape," he said, "from the made grounds and walk upon an adjacent goose-common, where the cart-ruts, gravel pits, bumps, irregularities, coarse, ungentlemanlike grass and all the varieties produced by neglect were a thousand times more gratifying than the monotony of beauties the result of design, and crowded into narrow confines with a luxuriance and abundance utterly unknown to nature." There are some people who will say that the genial Canon was exhibiting his want of taste. But the majority of honest men will agree with him, although they may lack the courage to own it.

The truth is nature is at its best when it is allowed to follow the courses which are dictated by its manner of creation. The only excuse for drill sergeants in the form of gardeners is when natural forms are made subservient to human needs as expressed by artificial forms. The grounds which overcame SYDNEY SMITH probably did not contain any architectural example of which they might enhance the interest, and which would in turn explain the arrangement. Art must supplement nature, and although CHAMBERS'S attempts to introduce Eastern accessories at Kew could not be considered successful, and were ridiculed out of popularity, yet there can be no gainsaying that the little gardens of China and Japan acquire from the introduction of structures in wood and stone a piquancy which cannot be denied. The miniature bridges and temples have not the beauty of those to be found in Italian gardens, but the principle which dictated their use is the same. We should always remember that such artists as MICHEL ANGELO, RAPHAEL,

GIULIO ROMANO and others knew all about the need of congruity, and yet they found no difficulty in operating with skilled gardeners, hydraulic engineers and builders in laying out the villas of their friends and patrons. It is particularly true of them and of those who humbly endeavoured to imitate them, that "nature is made better by no mean, but nature makes mean," for the artist if not the art was made by nature.

We can see in the majority of the numerous illustrations which adorn Mr. MAWSON'S volume how interest is gained by the combination of what is artificial with what is natural. It may be only a country carpenter's lattice-work, a simple timber pergola, a balustrade, a small garden house, or even a rough boulder wall. The vegetation near it then seems to have gained an interest from becoming an auxiliary effort. The greater variety, and the monotony caused by the repetition of similar forms is not felt.

What increases the interest of the illustrations is that so many are photographs taken from existing examples. This fact, and also the issue of several editions of Mr. MAWSON'S book in the course of a few years, are enough to show that the principles which are advocated by the author as well as by other architects are gaining recognition in this country. It is hoped the success of the book is not mainly owing to the amateurs, for the advice which is given about fences and gates, summer-houses and garden furniture, fountains, lakes, streams and ponds, conservatories, greenhouses, vineries and fruit houses, as well as chapters on the selection of ferns, plants, trees, &c., having been derived from experience can be turned to account by those who, although their lives may have been spent in gardenless houses in London streets, may be called upon to lay out grounds.

Men of that class, however, are not likely to be troubled by grievous faults. The common sense which is necessary to adapt buildings in town to varied uses if applied to garden-making will produce satisfactory results. The countryman is likely to connect land with utility, and is therefore liable to think of a garden in the same way as an horticulturist, instead of recognising that it must be sacrificed to the agreeable if the garden is to become the accessory of a house. In fact, a beautiful garden must possess many of the characteristics of a town house. The country is associated with freedom, and no men are so appreciative as genuine country holiday-makers when they find themselves in a domain where fences are practically ignored and a man may follow his own sweet will in his rambles. But in a garden accessory to a house privacy ought to be recognised, and gates and screens should be introduced which will suggest that even in the open air there can be privacy. That it should be respected equally with the privacy of the rooms of a mansion in Belgrave Square. What is called pleasing intricacies, artful wildness and so on, means to that end.

Another quality which is desirable in the large garden, and in the smallest garden is an expression of repose. This is hard to attain when a garden is new. Something can be done to alleviate the uncomfortable feeling which yesterday the place was but a naked sod. At once much could be gained by using old statues and columns and other things which belonged to older houses. It is possible to obtain aids of that kind, but people are becoming too knowing and too fastidious to appreciate them. If we believe SHAKESPEARE, the world has been deceived by ornament, that is to say, by outward appearances. But deception now must be replaced by another form.

If the garden is to be recognised as an accessory to the house then the relation between it and the house to which it is attached should be manifest. This can easily be done by having some resemblance between the garden's features and the house itself. No doubt in architecture forms which at one time were opposed are now coming to be regarded regardless of style. But unity has value in all kinds of decoration, and it should be sought after in garden decoration.

* *The Art and Craft of Garden-Making.* By Thomas H. Mawson, Hon. A.R.I.B.A. Third Edition. Revised and enlarged. (London: B. T. Batsford.)

The last building described in Mr. MAWSON's book could by itself be sufficient evidence of the skill which has been attained in treating the surroundings of a house and the advantages which a building has gained from the additions and alterations. Foots Cray Place at Hampstead is represented as it appeared in 1787. It is a favourable example of many buildings of that period, which suggest that they arose complete from the grounds on which they were dropped from the clouds. As the basement is above the ground, it is not so illogical as many with subterranean basements. It was on the way to ruin when it was discovered by Mr. S. J. WARING, and a number of illustrations show how it has been altered by Mr. MAWSON. Terraces have been constructed which have had the effect of suggesting that the house stands upon an extensive base, and the gardens have been laid out in such a way that the house now appears under a variety of aspects. Before we had a Classic building surrounded by a park, as if the architect wished to suggest a resemblance to some antique building standing in a landscape. Now we have a dignified residence surrounded by dependencies furnished by nature as well as by art. Examples of various other gardens are given, and in each case it must be acknowledged the additions enhance the value of the building. The examples form a most persuasive chapter on the benefit derived from accessory gardens. What is also worth consideration is that, though there is so large an addition of beauty, there is no loss of anything which can be regarded as utilitarian.

As a practical man, Mr. MAWSON enters into particulars which writers who consider effects alone would be disposed to pass over. The following paragraph on laying out the wing-walls is an instance of the author's regard for details:—

Nothing could be more deceptive to the uninitiated than the effect of curves. Somehow, even when they have had much care bestowed upon them in planning, curves lose the flow of line which on paper looks so pleasing; there is all the difference between a scale drawing which can be comprehended at a glance, and the lines as laid down and viewed in perspective. When dealing with a long curved wing-wall to an entrance a good method is to have the ground roughly levelled and a rope line laid down. For is obtain an old cart rope, or any rope free from stiffening; at one end to a peg fixed at the point where the wing-wall is to strike the pillar, and fix a second peg at the extremity of the bulge; having thrown out the line between these two points, from the first peg with rope in hand walk along the proposed line of fence, allowing the rope to pass lightly through the half-closed hand, repeating the operation until the line is pleasing to the eye. Having decided the line, ranging poles at regular distances along it, and imagine the interspaces brick or stone wall, when the result will generally be to make the curve longer or flatter by carrying the first peg further along the road, as curved lines always appear more full and rounded when viewed in perspective. The future purpose is to give the walls architectural character and dignity, from these actual lines make a survey, and afterwards design the necessary elevations.

Mr. MAWSON's book deserves recommendation from the interest of the subject and the beauty of the illustrations, which show architecture in union with fine landscapes. But it is also a practical work containing sufficient information to enable a young architect to carry out a commission for garden-making with advantage to his client as well as to himself.

The Dean of Winchester states that although the works of preservation at Winchester Cathedral are proving much more costly than was at first anticipated, a published statement that 100,000l. will now be required is an exaggeration. It is difficult at this stage to say what the exact amount necessary will be, but it appears likely that the original estimate of 30,000l. will be doubled. A report upon the recently discovered defects in the north transept and other parts of the building is in course of preparation, and when this is in the hands of the authorities a more definite statement as to the financial requirements can be made.

THE QUANTITY SURVEYORS' ASSOCIATION.

THE annual general meeting of the members of this Association was held at the Holborn Restaurant on Friday, May 31, the president, Mr. A. J. Gate, F.S.I., in the chair.

Formal work having been concluded, the President read the Council's report upon the work done during the preceding year, as follows:—

The Association is to be congratulated upon a steady increase of membership. Since our last annual meeting many new members have been elected, whilst we have lost four by resignation and three by death. It has been necessary during the past year, as in former years, to reject many applicants for admission as members, as their qualifications are not such as meet with the approval of your Council; in fact, were we to elect some of those self-styled quantity surveyors who apply for membership the very object for which this Association was formed would be defeated. As may be seen from the balance sheet, which has been in the hands of the members for some time, the financial situation for so young an Association can only be regarded as satisfactory. Since the issue of the balance sheet a certain sum of money has been set aside for investment. A small sum has also been transferred to a benevolent fund, and to this fund your Council will always be glad to receive donations. Our examinations were again held at King's College by kind permission of the Governors in April last. In the direct final or the professional examinations the following candidates satisfied the examiners:—Messrs. R. A. Churchward and W. Morris Evans.

In the preliminary examination held at Leeds qualifying for admission as students one candidate only sat and failed to satisfy the examiner.

In the examination for admission of members held last year in Pretoria, one candidate, Mr. H. A. Adams, in the office of the chief quantity surveyor for the Transvaal, passed.

The Council note with regret the comparatively elementary knowledge of "taking-off" and "pricing" some of the candidates display, and take this opportunity to remind intending candidates that in these two subjects, which are regarded as "typical," a very high percentage of marks is required.

Your Council wishes to express the thanks of the Association to those members who kindly undertook the duties of examiners, and also to those who acted as moderators.

The thanks of the Association are also due to the authorities of King's College for kindly granting us the use of their rooms in which to hold the examination.

The Council would again remind members that a register of assistants (not necessarily members or students of the Association) seeking employment has been opened, and has already proved of some considerable service. It is hoped that this register will be used as far as practicable by members who require assistance. Those assistants who wish their names enrolled on this register must be recommended by a member of the Association.

The committee on professional practice has devoted several meetings to the consideration of the Prevention of Corruption Act, 1906, and its effect upon the relations in some cases existing between the architect and the quantity surveyor. Some of our members having made inquiries on the question, the committee has been in communication with the Council of the Royal Institute of British Architects, and has taken the opinion of an eminent K.C. It is hoped shortly to issue a circular to members on this point.

Your Council has within the past year again been approached by the Transvaal Society of Quantity Surveyors with a view to their affiliation with us.

Under our by-laws no provision at present exists for affiliation with any society; the Council, however, having considered the question, expressed its willingness to call a general meeting of members with a view to obtain the necessary powers, making the condition that the by-laws of any affiliated society and any amendment thereto should be subject to our Council's approval, and that the by-laws providing for the admission of members should be more stringent. These conditions proving unacceptable to their Council, the matter has been allowed to drop.

In view, however, of the number of applications for admission as members which we receive from South Africa, and the Council feeling that those applications could be better dealt with by a committee on the spot, a small committee of this Association for South Africa has been appointed, with Mr. A. T. Babbs, of Cape Town, as hon. secretary.

Your Council note with satisfaction, from the correspondence it has received, that the scale of charges which the Association issued last year has met with some considerable acceptance, and is likely to prove of inestimable use to our members in the future.

Your Council noted also that under the Labourers' (Ireland) Act passed last year, the appointment of a surveyor in connection with any buildings erected under this Act is subject to the approval of the Irish Local Government Board.

In view of the probability of more stringent control being in the future exercised over the expenditure of local authorities than has been the case in the past, including those matters which immediately concern the quantity surveyor, *i.e.* the cost of public buildings and the settlement of builders' accounts, your Council considers the present a favourable opportunity to approach the English Local Government Board on the subject. Some correspondence has already taken place between your Council and the Local Government Board on the question of the employment of quantity surveyors on public buildings, and your Council hopes that the result will be of benefit not only to the members of this Association, but to the profession generally.

The scrutineers report that the following have been elected members of Council for the ensuing year, in addition to Messrs. Lawrance and Gate, who are, under our articles, life members:—

London Members—Messrs. T. J. Carless, H. T. A. Chidgey, S. Chatfield Clarke, F.S.I., H. W. Crickmay, R. L. Curtis, jun., R. C. Gleed, F.S.I., W. R. Hood, F.S.I., and Henry Riley.

Provincial Members—Messrs. H. Curtis-Card, F.S.I., S. W. Doyle, A. Harris, F.S.I., and W. Hoffman Wood.

Mr. R. G. Bare congratulated the Association upon its eminently satisfactory financial position, and also upon its increase of membership. In his opinion the affiliation with kindred associations, both in South Africa and other parts of the world, would mean greater strength for the London Association; and at the same time, however, the Council were acting wisely in insisting upon the by-laws of any professional society contemplating affiliation being subject to its approval. After expressing his regret that the Council had been deprived of the services of a valued member (Mr. Walter Barber) during the past year owing to ill-health, from which he has now recovered, Mr. Bare formally moved the adoption of the report and balance sheet.

The balance sheet having been subjected to some criticism by Mr. H. J. Camp (to which the President replied), Mr. J. Rookwood seconded the motion for the adoption of the report, which was carried.

Votes of thanks to the auditors and scrutineers having been carried, Mr. H. T. A. Chidgey moved and Mr. A. G. Cross seconded, "That the best thanks of the Association be given to Mr. Gate for his services as president during the past year," which was carried by acclamation.

The President briefly replied, and the meeting terminated.

At a Council meeting subsequently held, Mr. W. R. Hood, F.S.I., was elected president for the ensuing year, and Messrs. Arnold Harris, J.P., F.S.I. (Birmingham), and Mr. H. T. A. Chidgey (London) were elected vice-presidents.

ARCHÆOLOGY IN HAMPSHIRE.

AN excursion of members of the Hampshire Field Club and Archæological Society was arranged for Friday last by Dr. S. Andrews, the hon. local secretary for Basingstoke.

At Hurstbourne Priors, says the *Hampshire Advertiser*, Dr. Andrews read a paper, of which the following is a summary:—

Of Whitchurch, where we left the train, I need say little but to remind you that its name, "Witcerce," supports ecclesiastical history in referring the origin of our national Church to early Saxon times. If on your return you have time to spare you may well go into the present church and see a Saxon gravestone standing on the chancel steps. The town, too, was always a point of importance from its abundant water supply, on a much used highway from Winchester to Newbury, for Oxford, &c. Since leaving there we have skirted Lord Portsmouth's park of Hurstbourne by road, just missing the stream where you will have observed numerous black poplar trees with fine bunches of mistletoe on them. In the park once stood a cottage associated with bee-keeping, which, I may remind you, was a valuable

occupation in early days (at least, before we got run and molasses from the East Indies). Here at Hurstbourne we touch a branch valley, bringing considerable addition to the Test from the Bourne (*i.e.* stream) valley. Hurstbourne, otherwise Hursborne and Esbourne, is a water name, Es a Brythonic Celt and Bourne a Gaelic Celt, both referring to water. These notes are almost entirely derived from Dr. Stevens's "History of St. Mary Bourne," a pattern of a local historian. Here I must ask the club members to wake up and do some genuine original research work, lest we as a club merit mere graceful epitaph (Hampshire Field Club, 1909, Appendix) and here is one chance. . . . Hurstbourne Priors, which includes St. Mary Bourne, which we do not visit to-day, distinguished by its second name from Hurstbourne Tarrant which lies higher up the valley, that is also called Hurstbourne Regius, as held by the king, and guarding another prominent road out of the Hants and Wessex country over the passes of the northern hills. Of Hurstbourne Priors we gather some information in that in 1086 it was held by the bishop for the monks of St. Swithun; not an episcopal manor, but belonging to the convent, "and it always was," says the Domesday clerk, leaving to later scholars to learn that it had become so by the gift of King Edgar to Bishop Denewulf, 802. We also learn that it had, what was a frequent acknowledgment of such ownership, a payment or reduced taxation of thirty-eight hides, when it really possessed the equivalent to fifty-one. Of four tenants of a large manor I am unable to tell you the predecessors of this particular part now known as Hurstbourne Priors. I have detailed history from the Conquest to the Dissolution we must await the chronicler of St. Swithun's Abbey, which had been the overlord for that time, but at the latter date, say 1535, was leased by the convent to its bailiff, one Ellis Wynne, who continued to retain it under the Crown. In 1547 King Edward VI. gave it to Edward Duke of Somerset and Earl of Hertford, the "Protector," but on his being attainted in 1552 it went again in the hands of the Crown. By 1553 Sir John Gage held it, when he also was beheaded. It was bought in 1560 of the representative of Sir John, or of the Crown, by Sir Robert Oxenbridge, for 2,790*l.* 13*s.* 9*d.*—ten to twelve times as much now—and held by his family about three generations. It is this Sir Robert Oxenbridge whose tomb lies before you, possibly at first placed within the north annex as a mortuary chapel, and later put where you see it, possibly, as at Basing, originally placed here, and afterwards repaired later by the great nephew of the same name. Sir R. Oxenbridge was a member of a family of that name in Sussex. He had been Constable of the Tower of London for Queens Mary and Elizabeth, and was buried here in 1572. He had married a Kent lady named Fogge, whose arms he impales on his shield, and although she was from the well-known family of Fiennes, Lord Saye and Dacre, her quarterings are not either of them (in this I differ from Dr. Stevens's history). . . . The tomb strongly resembles one at Broxbourne in Herts, to the memory of Sir Henry, father of Elizabeth Cock, with its recumbent and kneeling effigies (he died in 1606, and his wife Ursula in 1612). The inscriptions on the north side are much defaced, recording the names and dates of Sir Robert Oxenbridge and his wife. On the south side the earliest inscription refers to the restorer. Of the other features of this church I feel unfitted to remark, but to note that the restoration of 1870 made use of some small north arcades possibly in their present site, and that a north arch gives access to the north chapel. A yew tree in the churchyard is said to be 700 or 800 years old.

Tidbury Ring.

At Tidbury Dr. Andrews read another paper. The place (he said) is known as Tidbury Ring; it is an unusual large camp, although not the largest of those so frequently found on these North Hants hills. That this ridge of hills is so numerous marked by Celtic camps is generally supposed to indicate an extensive population among them. Doubtless this was so to some extent, although possibly they were not all occupied at the same period, but according to fashion dependent on propinquity to the dwelling localities of those using them. Their use was distinctly exceptional and not constant; few would have any permanent occupation, although the vital necessity of water would well be met by dew ponds, which are frequent, and possibly by wells in some known instances. Yet original occupation is sometimes suggested by the fact of there occasionally being a modern farm or other dwelling in or close by them. But their primary use was defensive. When the ancient

out man, with his deep-set eyes aiding his distant view, gave notice to his home-folk of the near approach of a jealous and warlike enemy, the cry would ring through the settlement, "Away to the camp." Thence could be hurried the cattle, the wives and children, and much as could be carried of the household stuff. Meanwhile the men would be ready to meet the foe, and the clash of arms would ring out. . . . Now, please patiently follow me as I attempt a sketch of the origin of our section ancient and modern social life. You unconsciously form a picture in your mind of the modern corporation of a town, large, like Southampton, ubiquitously active, or small, like Chichester and Whitechurch (at our feet), that have lost their ancient franchise, or Basingstoke, that never possessed a national one. A body of citizens of more or less repute, with the power and duty to tax themselves and their community for local purposes. In some instances charters granting this privilege in various shapes were granted by a large landowner near, a baron or a Church magnate, sometimes by the Crown; notably in Stuart times was this in the care of the king for his people displayed, but charters of much earlier date are known (or referred to even as early as Henry I.) showing the existence of the self-taxing power of communities. Thus I would take you back to medieval times, where (pardon me for the personality of an example) we find Basingstoke as held not by a manor lord, as Whitechurch and many another which yet retains individual independence, but by a Corporation acting as such, called "The Men of Basingstoke." Then I would ask you to step back again to such as this camp, with one inquiry of why they had this power, and would point out the fact of an important camp there, with its primary duty of maintenance and defence placed on the shoulders of such men, and so recognised, acknowledged and rewarded with corporate power of a sort. Here, also, in Tidbury Ring we find an important military camp of Saxon times, similarly giving rise to the borough of Whitechurch, whose men in corporate capacity have the charge of this camp, and I have no doubt the same origin could be easily traced in every ancient borough, even to Edinburgh itself. On a lesser scale we find it in the three Cleres of North Hants—Kingsclere, Highclere of the Bishop and Burghclere, the latter the latter given to the men of the burgh, or borough, or burg, who had the responsibility for repair of the fine camp known as Beacon Hill, which is situated, northerly, on the same road as this is placed. All this refers, of course, to the modern as derived from the Saxon charge or use of the camp, and is quite independent of the Celtic origin of the camp itself as a local defence for those earliest structures who lived close round on the higher ground, above the valleys, which now team with human life, were conquered from the bog, morass and forest of nature.

Freefolk Chapel.

Sir William W. Portal, who received the party at Laverstoke, described the chapel at Freefolk, and gave an account of the manor.

Later in the day Dr. Andrews said they had listened with great pleasure to the instructive description of the neighbourhood given by Sir W. Portal, but he would like to see the members generally and individually to supply some specific information about the member of the Pawlet family whose tomb they saw so well cared for, as removed from the lesser building, although at one time it seemed destined for oblivion. The Pawlet family, now in Hampshire represented by the president of the club, the Marquis of Winchester, was formerly a Somersetshire one, one branch of which continues as the modern Earl Poulett or Powlett. A member of the other branch married the daughter and heiress of Sir John Munney, of Munney Castle, and his grandson married the heiress of the Barony of St. John of Basing, the instance Poynings. It was their grandson that had a notable family (murally speaking):—William, later Baron John of Basing, first Marquis of Winton, whose tomb of his father and descendants is in Basing Church; Thomas, known as to issue; George of Itchell, whose tomb is in the chancel of Crondall Church; and Richard (or John) of Herriard, of whose descendants they had this monument. The Herriard branch married the heiress of Richard Andrews of Freefolk, and seemed to prefer this locality, the daughter and co-heiress marrying the ancestor of the present Jervoise family of Herriard. The Paulet monuments in Basing give heraldic quarterings showing the connection of Paulet and St. John connections by marriage, eight in number. The Crondall one gives the same, perhaps differently grouped, partly instead of quarterly, and with a heavy impalement of thirteen quarters from one of

the three wives. His own quarterings are easily comparable with Basing. Here, however, the Herriard-Freefolk branch shows a more full achievement of twenty-eight quarterings of Paulet himself; the wife's shield is separately represented. In this shield the arms represented at Basing appear without consecutive order. What he would like to discuss would be the names of the other families referred to, and possibly collect from various sources their relationship to the Paulet before them.

THE VILLA PALMIERI.

UNUSUAL interest attaches to the sale of the beautiful and historic Villa Palmieri, in Florence, by the Earl of Crawford, the premier Earl of Scotland, to the New York plutocrat, Mr. James W. Ellsworth, who, it is said, intends to go back upon ancient times by furnishing the villa in the manner of the fifteenth century.

Tradition fixes upon the Villa Palmieri as the palace in which, during the great plague in the city of Florence, Boccaccio took the company of his immortal tales of the "Decameron." The tales were told, of course, with the object of whiling away the time while the great plague raged, but since that time they have been read by succeeding generations, and time has failed to stale them or to rob them of their interest. This historic association with world literature gives the sale of the villa unique and universal interest.

But this Palace of Tales has a peculiar interest to all Englishmen from the fact that it was here the late Queen Victoria stayed on more than one occasion, for the ancient Florentine palace, with its wonderful and glorious gardens, was greatly beloved of her, and it has further a special interest for Lancashire folks, because for more than a generation it has been the home of the courtly and stately Dowager Countess of Crawford.

The late Earl of Crawford, who, like his son, the present Lord Crawford, of Haigh Hall, Wigan, was bibliographer and bibliophile, purchased the historic villa in 1874, and probably its traditional connection with literature, as well as its beauty of situation, had some influence in determining his choice. Queen Victoria was the guest of the Dowager Countess of Crawford for some time in 1888, and again she stayed at the villa in 1893, always cherishing kindly memories of these Florentine visits.

It may be mentioned, says the *Scotsman*, that it is just twelve months since the villa was placed upon the market, when a bid of 30,000*l.* was invited by the auctioneer, but ultimately the property was withdrawn, the reserve not being reached.

The Villa Palmieri is the Palace of Tales. The beautiful scenery all about is enshrined in the writings of the great Italian master. Boccaccio knew this house beautiful and all its ancient glories. At one time the place belonged to Cioni de' Fini, from whom the Tolomei bought it at a later date, and later still in the fifteenth century it was sold to Matteo Palmieri, and it was by a descendant of this Italian worthy, whose name it has for so very long borne, that it was rebuilt. This rebuilding of the historic fabric took place in 1670. From this time forth it was known by the name of the Palmieri. Originally the high road to Fiesole, traversed the place where now the grand terrace is located and, in fact, this was only cleared away after the late Lord Crawford had bought the villa in 1874.

But the fame of the villa with the English people has not been confined to recent times. For two centuries and more it has been a great favourite with the natives of old England, and its history during this period has only to be quoted in proof of this statement. Thus, so far back as 1766 Lord Cowper came to the place with his lady, who had been known as the beautiful Miss Gore, and the pair were so enamoured of it that they resolved to make it their home, which they did, and in his letters Sir Horace Mann describes their brilliant entertainments, and speaks of the admiration of the Italian people, high and low, for the young and lovely countess.

Then, again, it is recorded that from 1824 for nearly thirty years Miss Mary Farhill, an eccentric lady, lived here. This lady left the mansion to the Grand Duchess Maria Antoinette de Bourbon, and later still in 1874 it passed into the possession of the late Lord Crawford, scholar, poet and book collector.

On the death of the Earl of Crawford the beautiful and historic home descended to the present Lord Crawford, whose ancestral seat, Haigh Hall, near Wigan, Lancashire, is renowned the world over for its private library, worth many fortunes in itself.

NOTES AND COMMENTS.

THE annual report of the Council of the Royal Sanitary Institute states that they were not able during the past year to lay before the members any definite proposition with regard to new premises, but the matter has engaged the attention of the special committee, and their deliberations may be expected to result shortly in a satisfactory proposal for rehousing the Institute on a more adequate scale. For examination in sanitary science as applied to buildings and public works ninety-five candidates presented themselves, and thirty-six of them obtained certificates. Colonial examinations have also been held in Bloemfontein, Cape Town, Hong Kong and Sydney. An additional centre was established in New Zealand. Arrangements are in progress for examinations in Canada, Queensland, Western Australia, Tasmania and South Australia. There is a steady and satisfactory improvement in the financial position and stability of the Institute. Notwithstanding an increase in the general establishment charges owing to the extension and development of the Institute, the regular receipts from subscriptions and dividends have increased at a greater rate, so that the Council have been enabled to devote nearly the whole of the income derived from the teaching and examination work of the Institute towards the improvement of its courses of training and its examinations and other work.

At the last meeting of the Cambrian Archaeological Association held at Shrewsbury, the committee, having had its attention directed to the dispersal of certain articles from the public museum of the Bangor City Council, as well as to the disappearance of articles from the museum formerly in Carnarvon Castle, expressed their regret that sufficient care does not appear to have been exercised in the instances in question in the custody of articles of historical and archaeological value, and begs to impress upon both public bodies and private individuals the importance of the safe preservation of all such relics of the past within their charge. The removal of archaeological objects is a genuine grievance, and Welshmen especially have reason to complain, for the Principality is not too rich in relics. But of late there seems to be an epidemic of kleptomania which is at its worst in the presence of the cabinets of museums. The annual meeting of the Association is to be held in August at Llangefni, in Anglesea, when we suppose the subject will be discussed and measures proposed for the greater security of archaeological collections.

DISCONTENT is showing itself in many places where it is found that officials who are paid a fixed salary are allowed to perform other duties under favourable conditions and at special rates. They resemble the case of the late Mr. MACKISON in Dundee, only that more courage is shown by English officials in respect of payment. A late instance has been afforded in Lancashire. Mr. LITTLER is architect to the County Council at a salary of 500*l.* Application having been made to the Council, he assisted the Asylums Board in the selection of a site for a new asylum. His advice was adopted, and next Mr. LITTLER was appointed architect for the building. At the last quarterly meeting of the Board there was a proposal to pay him 500*l.* for his services in selecting the site. Some of the members objected to the payment on the grounds that Mr. LITTLER was receiving a salary from the county and that he was to receive between 15,000*l.* and 20,000*l.* as commission on the proposed building. It was stated in defence that the usual commission for architects should be 5 per cent. plus 2 per cent. for quantities, while Mr. LITTLER was only charging 4 per cent. The matter was, however, thought unsatisfactory, and was sent back for further consideration. It is not to be expected that an able architect would give his entire services to a county council for 500*l.* a year, for

with public works there is generally much contention which is more exhausting than any arising in private practice. But we do not consider that a man who possesses a safe position by having a regular salary and opportunities for suggesting his eligibility should give his services on lower terms than ordinary architects. At the present time, from the large number of architects and the rarity of commissions, there are risks of unprofessional competition, and if any men are duty bound to avoid taking part in the game of underselling, they are officials who, if they have not the means of becoming wealthy, are secured against the pains and penalties of actual poverty.

PRINCES STREET is of so much importance in Edinburgh, few people of the unofficial class were surprised when it was announced that the Town Council declined to allow the Post Office authorities to lay underground wires along one side of the picturesque thoroughfare. The Post Office is at one end of the street, which it was desired to connect with the western extremity of the city. The most direct route would be along Princes Street. The Town Council proposed an alternative course that the telegraphic wires should be laid along the Waverley Bridge, which would mean carrying them across the Old Town and around the Castle Hill in order to reach the point indicated. Although the Post Office could lay wires from one part of the city to another, the Town Council maintain they were to decide upon the routes. At the last meeting of the streets and buildings committee it was proposed that the wires should be laid along the south side of Princes Street, and apparently the "cut and cover" method will be adopted. The formal sanction of the Town Council has to be obtained.

WE have already described some of the efforts made by the University of Illinois to promote the study of scientific construction. They have been successful. The Board of Trustees have, as a fitting recognition, agreed to increase the number of resident Fellowships. Ten will be offered this year, each having a stipend of 500 dols. a year. One of the objects is to induce engineering graduates to resist the offers for their services, in order by matured study to attain the degree of master. The testing-station of the University offers desirable opportunities for research, and as the results of inquiries and experiments are published, the Illinois University will in that way do much towards the increase of knowledge of materials and structures. The proposal suggests the organised efforts which are making progress in America to attain the highest reputation in applied science.

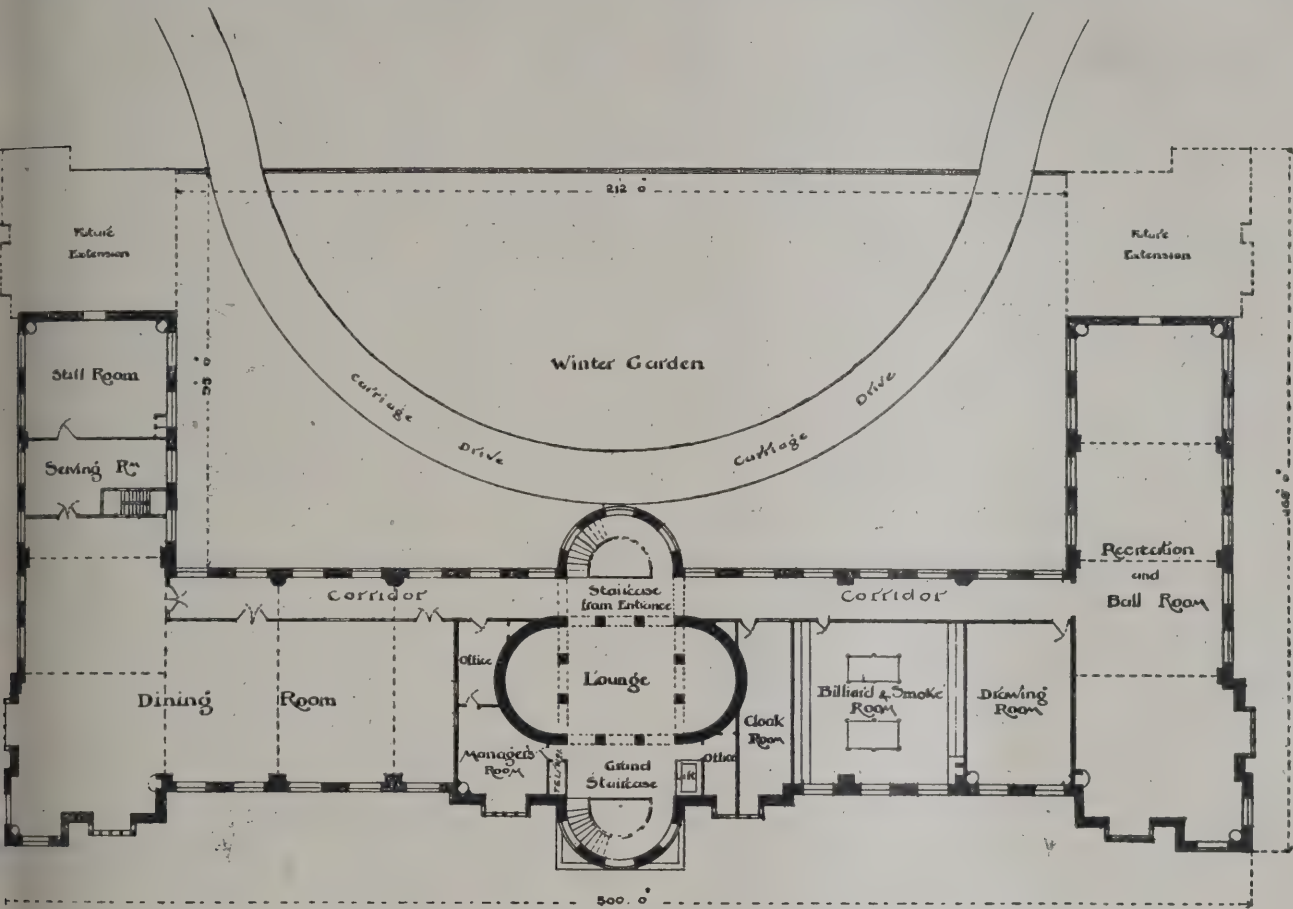

THE twentieth annual report of the Devon and Exeter Architectural Society states that the membership has been maintained, and that sustained interest is still shown in the affairs of the Society. After removing the names of five by resignation and transfer, the roll of members now stands at ninety-four, viz. members fifty-two, associate members fourteen, and associates twenty-eight. Since the last annual meeting eleven meetings have been held, seven being of the Council and four general, and the Council have discussed several matters of importance under discussion. They fear that the younger members have overlooked the advantage offered in connection with the London Architectural Association, by which students of the Society can join the school of design, and therefore book prize of one guinea offered by the Society has not been awarded. For the prize of one guinea offered by the Society for measured drawings one sheet only was submitted, but being deemed worthy of the prize, was accordingly awarded to Mr. G. B. SELLECK, Plymouth.

THE PALACE HYDRO, HARROGATE.

THIS building is to accommodate (when wings are completed) 250 visitors and staff. It will be built of stone from the celebrated Pateley Bridge quarries. A roof promenade is a feature, and from here views

GROUND PLAN.

or twenty miles will be obtained. The hoist will convey visitors to the roof by the central tower. The hydro is to be erected by a private syndicate. Mr. J. ELLIS MARTEN, of Harrogate and Bradford, is the architect.

GLEBE COURT, GORING, OXON.

THE residence of the late Mr. JAMES SINCLAIR is beautifully situated on a terrace surrounded by three acres of grounds. It has a southern aspect and commands extensive views of the surrounding country, being within a few minutes of the river Thames. The locality in which it is built is much noted for the beauty of the river and splendour of the surrounding country. The architect is Mr. H. J. DODD, F.G.S., Reading.

RATHORNE HALL, YORKSHIRE.—ENTRANCE FRONT, GENERAL VIEW

The Committee of Management of the Belfast district asylum have during the last five years erected at Purdysburn four villas to accommodate fifty patients each at a cost of 5,000l. per building. These buildings, which are intended to form the nucleus of a new city asylum on the villa colony principle, provide maximum accommodation at minimum cost, and have proved most satisfactory. It is now proposed to provide villas for the patients at Grosvenor Street asylum and Ballymena, with administrative buildings, &c., at a total cost of 110,000l.

NORWICH CHURCHES.

THE annual meeting of the Norfolk and Norwich Archaeological Society was held last week under the presidency of General Bulwer, C.B. The report referred to the efforts for the completion of the restoration of St. Peter Hungate, and the commencement of the restoring of St. Mary's Coslany.

After the meeting, says the *Norwich Mercury*, the members walked to St. Mary's Coslany Church. Mr. J. T. Hotblack said that practically the whole of the church, with

the exception of the tower, had been rebuilt in the Perpendicular period, probably about 1400. With one exception all the windows were Perpendicular, and he thought that originally the stonework was all of clunch, a great deal of which still remained. The window over the vestry in the north end of the chancel was Decorated and probably formed part of an earlier church. In the east of the church they hoped to put a three-light Decorated window in memory of the three great artists of the Norwich school who were connected with that parish. John Crome was married there, John Sell Cotman christened there, and the Rev. E. T. Daniel was for a time minister. R. Ladbroke was also married there. Continuing his description of the church, Mr. Hotblack said that in the west wall to the north of the tower was perhaps the oldest memorial-stone in the city, dating from 1298. He then mentioned the finding of four ancient windows in the round tower, all identically alike. He thought he might correctly call them Saxon and put the date of their construction between twenty years before the Norman Conquest and twenty years after, and claim that they were the oldest wrought stones in the city.

After lunch the company reassembled at St. Peter Hungate Church, where the Rev. C. W. Baker said about 700l. had been given and spent, but the restoration was not completed. They still wanted more money with which to fit the church so that it might take its place in the religious life of the parish.

Mr. G. A. King read a long and technical description of the old stained glass in the church, which he has examined minutely. Prior to the initiation of the successful effort made in the year 1904 to restore the church, the glass was removed into safe keeping, and later was entirely releaded and refixed in the church, and the portions that remain are of considerable interest. After quoting Kirkpatrick and

Blomefield, Mr. King said that the glass is of two quite distinct dates, as evidenced by draughtsmanship, method of shading, colour of enamel, conventionality of treatment or otherwise. More than one-half of the glass is work of the middle part of the fifteenth century, and is no doubt the remains of the stained glass provided for the church at its rebuilding by John and Mary Paston in 1458-60. One piece of glass, a crown now in the north window of the north transept, is probably a survival of the older church, dating from about 1350. The existing glass of the period of the rebuilding includes the following interesting pieces. The tracery in the west or tower window has in the centre openings a coronation of the Virgin, unfortunately imperfect. In the north window of the north transept the heads of the four lights are filled with representations of demigods holding scrolls. Portions of canopywork still remain in the heads of the four lights of the east window of the same transept. The centre opening in the tracery of the first window on the north side of the chancel contains part of the story of Peter's acknowledgment of the Messiahship of Our Lord. The window next the altar has remains of canopywork in the heads of its three lights, and in the tracery above are four-winged figures. After further details, Mr. King went on:—Turning now to the east window of the chancel we find that not a particle of heraldic glass now exists. Sir John Paston, second son of John Paston (born in 1444), married Margery Brewse, and in the east window there is a piece of glass, originally part of the floor in one of the pictures, and having a portion of a scroll painted upon it. The name "Margery" is written on the scroll in black letters, and may relate to Margery Brewse, whose arms were still in the window in Blomefield's time. There are two heads in the window which are of interest. The first is all that now remains of the four Doctors of the Church, who once adorned the four-light window on the north side of the chancel. The head of St. Gregory is not complete, but sufficiently so to give an idea of the character of the original work. It looks like glass of a slightly later date. The mitre issues from a coronet, and the Holy Spirit is represented as a dove speaking in the right ear of the saint. The nimbus is rather elaborately ornamented, and on the left side of it are parts of the crozier held by the saints. In the east window of the chancel in East Harling Church there is a head of St. Gregory of about the same size, but the position of the head is reversed and faces to the left. There is a very close resemblance between these two heads; they are evidently of about the same date and probably from the same atelier. The head of St. Gregory has unfortunately no proper connection with the drapery forming the figure to which it has been attached, which is much later in execution, and mainly a patchwork of various fragments of painted glass. Blomefield, in his note on the stained glass, makes no mention of an Annunciation, one or two fragments of which still exist. The head of Gabriel, very delicately painted, is, like that of St. Gregory, attached to the body of a figure of later date. The head bears a striking resemblance to that of the Angel of the Annunciation in East Harling and Ringland churches. A charming figure of about 13 inches high, painted on one piece of white glass, represents St. James the Greater. The saint, of venerable appearance, wears a long-sleeved fur cloak, which is fastened in front by some kind of spiral-shaped shells and loops. His hat hangs on his shoulders, and is retained in position by a cord and tassel; his wallet is suspended on the right side by a strap coming over the left shoulder. The left hand holds a clasped book, and the right a pilgrim's staff and rod secured by a narrow band crossed and recrossed down the length of the staves. St. Bartholomew is represented with a flaying-knife and book, and wearing a red tunic and white cloak. St. Simon carries a large fish and wears a cloak of soft white with stained border. St. Agatha holds a four-pronged hook in her left hand, in her right a book. Her kirtle is green, open in front and showing the breasts. There is another female saint in white, carrying a book, but the emblem is missing, and there are parts of two or three other figures, but there is no means of identification. With these figures of saints there is also a fairly complete representation of a patriarch, with green turban and white cloak, while on one of the two centre openings in the tracery of this window there is another patriarch with pale blue turban, green tunic and white cloak. Facing him is a king crowned, but without a nimbus; he holds a sceptre, wears an ermine tippet on his shoulders, and a red robe. It is possible that this figure is intended for Henry VI.,

who was reigning at the time the church was reopened, or perhaps it is intended for King David. Turning now to the rest of the glass in the east window, we find that there still remain portions of the four Evangelists mentioned by Blomefield. The most perfect figure is that of St. John, easily identified by the ruby-coloured dragon issuing from a cup held in his left hand. St. Luke is identified by part of a nimbus of a russet yellow, showing the horns of an ox, and part of a wing still in their original position at the feet of the figure. The next figure may be taken as representing St. Mark, for among the patchwork drapery is part of the body of a lion, but not in its original position. Of the remaining figure, St. Matthew, practically little remains except the head, which is worse drawn than the others. The drapery appears to have been fairly well designed, but the work as a whole will not bear comparison with the earlier glass. The date appears to be about 1535. We have now to consider the panel of stained glass, perhaps of as much interest as anything in the window. The figure represents a priest kneeling in the attitude of prayer at a prayer-desk. His vestment is purple, and the desk an altar-tomb in the background are yellow, shaded with a mat of enamel, upon which lines of tracery are scratched out. The background above the tomb and desk is made up of pieces of canopy. The drawing and pose of the figure are good. The head is small in profile and tonsured. The hair is black, and lines of the hair are shown by scratching out with a very fine point. Beneath the figure are the remains of an inscription, and the date 1522. The question at once arises whether this is, after all, "the effigies of Thomas Andrews, the rector" (noted by Blomefield), who was buried in the chancel in 1468. A careful examination of the method of treatment shows that the glass is of much later date than the rebuilding of the church, and perhaps earlier than the four Evangelists. If this is a correct opinion, the figure is not that of Thomas Andrews, and a very careful study of the whole of the glass leads to this conclusion. In one of the windows in the north aisle of St. Andrew's Church is a small panel, on which is painted a representation of Robert Gardener, alderman, who died in 1558, and there are points of resemblance between the two figures which indicate a close approach as to date. Mr. King illustrated his remarks with some excellent water-colour drawings, made by himself, of various details.

Mr. J. T. Hotblack also exhibited some drawings of the old glass in the east window, made about fifty years ago by the Rev. C. W. Shickle, F.S.A., of Bath, when he was a youth resident in the parish. These show that, notwithstanding the vicissitudes through which the church has passed, no single piece of glass has been lost and on no one piece had been turned round. This has now been altered.

From Tombland the company proceeded in carriages to the Magdalen chapel, concerning which Mr. J. C. Tingey read a paper, in which he pointed out that from time to time the building in which they were assembled had been known as the Magdalen chapel. Yet until the last half-century it was nothing more than a name except to a few antiquaries. Even now very little was known of its history. The foundation of it must be placed before 1119, which year the first Bishop of Norwich died, for the first register of Norwich Cathedral set out that "Herbert, the bishop, sedulously persisting in deeds of mercy, founded a certain house in honour of St. Mary Magdalen, on the estate of his church outside the city of Norwich, for the relief of lepers; and he gave certain lands and possessions of the said church for their sustenance." It was, therefore, a lazaret hospital, and the doorways of the south and west sides are most likely Bishop Herbert's work. Still there is some ground for suspecting that these doorways are not in their original positions. That on the south side, at least, has recently been rebuilt. There is also a Norman buttress on the north side, and it may be inferred that the walls are of the same period. The building is 99 feet by 21 feet, and a note of Kirkpatrick gives the length as 45 paces, though he (Mr. Tingey) could not make it exceed 40. The point was rather important as helping to determine the position of the east wall, of which very little remained. Taylor says that a small oratory was attached to the hospital. No traces of dividing walls have been discovered, so perhaps nothing more than a screen separated the oratory from what would now be called the ward. This hospital has always been reckoned as one of the five lazaret houses of Norwich. The others were situated outside certain of the gates of the city, but their foundations are very obscure. One was in St. Stephen's

opposite Victoria Station; another outside St. Giles's gates, opposite the north porch of the new Roman Catholic church; another in the corner formed by Barn Road and Dereham Road; and the fourth on the east side of what is now Waterloo Road, just beyond the Board school, its site being still known as Infirmary Square. There were also leper-houses at Lynn, four at Thetford, two at Yarmouth, and various others scattered about the county, where they were not more numerous than elsewhere. On this account it has been surmised that leprosy was a common disease in Mediæval England, but the latest authorities are by no means convinced of it. Most likely true leprosy did exist, but the uncleanly habits of the people, coupled with their enforced diet of salt meat during six months of the year, rendered them liable to diseases of the cuticle, all of which were considered as equivalent to the Biblical leprosy and highly contagious. Leprosy practically disappeared in the fifteenth century. In consequence, the administration of a leper-house became a valuable sinecure, while the sick poor, who ought to have succeeded to the benefits of the foundation, were neglected. In this house, as has been said, the refectory became a chapel, no doubt at the expense of the funds previously allotted to the sick. The scandal went on until the Tudor sovereigns roughly put an end to it. In 1548 Edward VI. granted the hospital to Sir Robert Southwell and John Corbet, and in 1669 it appears to have been an almshouse for poor widows. In recent years Mr. W. Tyne rescued it from demolition, and his successor, Mr. Justice Gurney, has done all that was possible to preserve it and to restore it to its former state.

ARCHÆOLOGY IN DURHAM.

THE first country meeting of the year of the Architectural and Archæological Society of Durham and Northumberland was devoted to visiting Prudhoe Castle, the Grange at High Prudhoe, Ovingham Church, Bywell Castle and the contiguous churches of Bywell St. Andrew and Bywell St. Peter, short descriptions of each being given by Mr. V. H. Knowles, F.S.A., of Newcastle. Prudhoe Castle, says the *Durham Advertiser*, is romantically situated on an isolated mound about 500 yards from the river Tyne and occupies what would in Mediæval days be considered an ideal site for strength and invulnerability. The castle is the property of His Grace the Duke of Northumberland, and the modern dwelling within it is now occupied by Mr. T. D. Milburne, by whose permission the members were allowed to go over it. The castle was approached by a barbican and inner gateway, between which was a drawbridge over the moat before the latter was filled up. This gateway, as Mr. Knowles explained, is the earliest part of the castle and is Norman. The castle was occupied by one of the Umfravilles, who came over with the Conqueror and received as his reward lands in the Redesdale district, these being subsequently augmented by the estate of Prudhoe. The chapel above the old gatehouse is about a century later, probably of Edward I.'s time. It has a beautiful little oriel bay forming the chancel, lighted by two lancets, and forms a very choice little bit of Early English domestic work. The party then passed through the outer wicket and in the wall examined the entrance of what is supposed to be a subterranean passage leading down to the river. The great tower or keep, partially dilapidated, was inspected. It is about the same date as the keep at Newcastle, which was built between 1170 and 1180. Leaving the castle by way of the picturesque gardens the party climbed the hill to Prudhoe to see the Grange, now a modernised residence, but which contains a doorway with Early English mouldings and walls of great thickness, probably forming part of the chantry chapel of St. Thomas the Martyr. The doorway is a very interesting specimen, and was generally admitted to be well worth the climb up the steep bank to view it.

Returning, the company crossed the river and inspected Ovingham Church, being welcomed there by the vicar, the Rev. C. F. Thorp. Mr. Knowles said that perhaps the most interesting feature of the church was the tower at the west end. It was similar in some respects to those at Bywell St. Andrew's, Warden on the Tyne, and Billingham, in Durham county; and there were similar towers in Lincolnshire. The characteristic of them was that they were built without any projections or buttresses, without any offsets most. They were eleventh century and just a little pre-Conquest. Although some people might call them Saxon, they were unlike the earlier Saxon work done by Wilfrid and St. Bede at Hexham, Jarrow and Monkwearmouth.

They were a type by themselves; and no doubt just built in the time of Edward the Confessor. The tower might have been built for defence, as much as for any other purpose, and was divided into four or five stages. The belfry stage at the top was somewhat elaborate, with its double-light window. The tower belonged to a church of which probably there were no remains excepting the west end of the nave, evidenced by the straight lines which indicated a nave without aisles. The church, such as at first existed with its western tower and nave, gave place to considerable addition when the chancel and transepts were built. These followed, no doubt, soon after the energetic church-building period of Bishop Pudsey, of Durham, and was altogether a very simple and effective structure of probably the first quarter of the thirteenth century. The peculiarities are the exceedingly long transepts, the plan being somewhat after the form of a Greek cross. The aisles are on the west and not on the east side of the transepts. The general peculiarity of early churches was their height in comparison with their width, and that accounted for the loftiness of that church. The low side window, the piscina and other antique objects having engaged attention, the party visited the tomb of John Bewick, the engraver, and afterwards took train to Stocksfield.

A pleasant walk of three-quarters of a mile among some magnificent and rare trees, now in their most beautiful garb, brought the company to Bywell Castle. At Bywell, as at Dunstanborough, Bothal and Tynemouth, the gatehouse was the keep, and there they got the entrance into the castle proper. Bywell is first mentioned in connection with Guy of Baliol, one of the followers of the Conqueror, and in Edward I.'s reign it was occupied by one of the Nevilles. The machicolations above the gateway from which to throw molten substances upon an attacking foe claimed attention, as did the aperture over the straight stairway leading to the first floor, used for a similar purpose. The place is full of nice architectural detail in the way of window embrasures and fireplaces and turrets, and the grooves for the portcullis, together with the original iron grille at the foot of the staircase and the oaken gate at the entrance, all attracted the attention of the visitors. The date of the present building is fifteenth century. The church of St. Andrew was then inspected, Mr. Knowles stating that it was another of the early pre-Conquest churches similar to those at Warden, Billingham and Lincoln, and was the smallest of the lot. The wall on the east side of the tower denotes the width and position of the nave that was contemporary with it. One reason why it was supposed to be merely pre-Conquest and not of the early part of the Saxon period was the fact that early stones similar to those of Saxon crosses were built into the tower. With regard to the church of St. Peter being so close to that one, he considered the story of the two sisters who quarrelled, which was given as the reason, to be all fudge. Though its population has now disappeared, Bywell was once a thriving place, the populace being makers of armour and iron workers. They could still see the old market cross, which stood originally between the two churches. The church of St. Peter, the earliest portion of which is thirteenth century, was then viewed, and some very pretty interior architecture, especially in the way of windows, was inspected, this concluding the day's programme.

ARCHITECTURAL ASSOCIATION OF IRELAND.

AT the concluding meeting of the session of the Association there was an exhibition of drawings submitted by members in competition for the prizes offered by the Association and the Royal Institute of Irish Architects.

The Hon. Secretary read the result of the ballot for officers for the ensuing session, viz.:—President, R. M. Butler; vice-presidents, Edwin Bradbury, Lucius O'Callaghan; committee, J. H. Webb, Harry Allberry, H. G. Leask, P. L. Dickinson, G. F. Beckett, F. G. Hicks, A. G. C. Millar, J. Holloway and J. A. Geoghegan; treasurer, F. Hayes; secretaries, R. Donnelly, C. H. Mitchell; librarian and registrar, G. G. Lynes; auditors, C. L. Harrison, L. du P. Millar.

The prize winners were announced as follows:—The A.A. travelling studentship, P. J. Munden; the Royal Institute prize for a design for a country hotel, won by C. G. Ramsay; the President's prize, P. J. Munden; the Downes bronze medal for sketches, H. T. O'Rourke; the Vice-President's prize, C. Keefe; the class design, P. J. Munden.

The annual excursion is to be held in Shakespeare's country from July 9 to 13.

Mr. Joseph Holloway, the outgoing president, delivered a valedictory address. He congratulated the Association on the progress made during the year. Before that Association came into being in 1896 there was very little opportunity for those pursuing the study of architecture to gain knowledge, except by sticking close to the desk of the architect to whom they were articulated, and picking up what architectural crumbs they could, haphazard, from what they saw going on around them during office hours. Now all that was changed. The educational scheme so energetically and enthusiastically nursed into life by the late President had at last received the blessing of the Royal Institute of Architects of Ireland, and it would soon blossom in the forefront of the Association's work under the guidance of their new and energetic president, Mr. R. M. Butler. Continuing, he said:—I am pleased to say that the few words I addressed to you at the opening meeting did not fall on barren ground, and many of the subjects I touched on then are now bearing fruit. For instance, I notice with pleasure a praiseworthy effort being made on the part of architects to use Irish limestone, &c., more frequently than heretofore. While I see an awakening to the advantages of the employment of native materials, there is yet much to desire in this way before "All's well" can be called from our housetops. What we architects really want most at present is to evolve a style more suitable to the hardness of our native stones than that at present in vogue, so that we can get the maximum effect out of the minimum of labour in the way of mouldings and carvings. Carvings and mouldings that could easily be worked in the softer sandstones and such like are quite impracticable and ineffective when attempted in either granite or limestone. It stands to reason that the materials of a country are the best and most suitable for building in that country. Look around you in Dublin and you will be struck with the fact at once. Limestone is the great building stone of this country. It was employed in the Ulster Bank, College Green, and in the stately block of buildings at the corner of Dawson and Nassau Streets, and what could look better? The new Museum and National Library were built of Mount Charles sandstone—a splendid stone for city work. And of granites we have a charming variety, that from Ballyknocken, perhaps, being the flower of them all. Newry granite polishes well, but it is hard to work. The only imported stone (other than marble and granite) that stands our climate in external city work is Portland stone. When it takes on an outer crust it stands admirably. All our fine eighteenth-century buildings are partly built of Portland stone, all other imported stuff especially of sandstone nature fades away after a time. The dressings of the recently-restored Christ Church are going already, and the red sandstone bands in St. Anne's Church, Dawson Street, are in a very advanced stage of decay. I could name many such crumbling stone structures, but all who pass along our principal thoroughfares can see for themselves the way our climate eats into the imported stone. The propriety of the use of native stone is so obvious that it got overlooked, but now that it has been pointed out, the importation of cheap and rapidly decaying stone, I hope, will cease. There is nothing patriotic about the matter. Irish stone is the best in the market for durability in our own land; then why should we go out of our way to import an inferior article? Bad stone is dear at any price, even as a gift. Mr. Lavery, who has carried out much work in granite, told me quite recently that Ballyknocken granite takes the finest mouldings, and referred me to the work on the new arch at Stephen's Green as a proof of his statement. And above all—learn to place confidence in yourselves. It was a wise person who said:—"Never imitate. Your own gift you can present every moment with the cumulative force of a whole life's cultivation; but of the adopted talent of another you have only an extemporaneous, half-possession." How true—quite true. I saw in a paper the other day that "one of the tragi-comic curses of Ireland is of people being afraid to be themselves and follow their bent, lest they hurt the feeling of others just as timid in turn," and I quite agree with the sentiment. My own creed is, that anything that does not serve a useful purpose in a building is not ornamental. They serve no useful purpose, and certainly never look well. It is an age of sham I greatly fear. How to make everything resemble something else is all the rage. I suppose you all have observed that an epidemic of paint has broken out in the city—stonework, brickwork, everything vanishes before its

art-killing sway. Everything must be touched up in glaring, inharmonious colours that would make anyone possessed of a scrap of taste have bad half-hours of agony as he passes through the streets and views the house fronts smeared with all sorts of primitive shades of vile colour. The worst offenders in this paint-everything craze are the lords of the spirit bar. Those art patrons of our profession expend large sums of money each year in having their premises elaborated, and then cover up fine work in crude shades of paint. They who pay the piper may dance or not to the tune they pay for, is their idea, no doubt. They usually pay for the best materials, and then conceal them under paint. I think the painters and decorators of Dublin are to blame chiefly in this wholesale destruction of stonework, brick and woodwork. It would seem that they have discovered that bricks, limestone, granite, mahogany and oak are the best groundwork for the display of paint, and accordingly act upon the discovery. Everything must be covered with paint of the most glaring, vivid and hideously crude shades. You can hardly enter a principal street in the city without your artistic sense receiving a shock. Brickwork is coloured all shades of the rainbow, and limestone and granite receive the same generous treatment at the hands of the destroying painter. Is it a sense of the artistic dead in our city, that the citizens, not to say the profession, stand idly by and see the splendour and dignity of their city ruined by paint? I am old enough to remember our city a noble and sombre thing of beauty; but now we must paint that out and give it the air of a new gin palace. A world without taste is a world without artistic pleasure. That is what it is rapidly coming to, unless you, my fellow students, resolutely put your foot down against what is going on and try to beautify our city and not to destroy its dignified and imposing character by allowing new, inappropriate buildings to be erected at the sweet will of those who conceive only visions of ugliness and horror. If you make a firm stand against such architectural freaks, then Dubliners may look forward to a city ever increasing in nobility and charm under your watchful care. Form yourselves into an ideal committee of taste and control all the improvements, and if only engineers could be taught that architects are their masters, then much would be gained towards the realising and maintaining of our city as a haven where beauty lingers.

Votes of thanks to the President and the class secretaries were carried.

SCOTTISH NATIONAL EXHIBITION, 1908

THE committee of the Scottish National Exhibition, to be held in Edinburgh in 1908, met on Friday last to receive the report of Mr. John James Burnet, A.R.S.A., architect, Glasgow, their assessor, on the competitive plans sent in for the exhibition. The competition was for a building to cost 20,000*l.*, with a margin of 10 per cent. over, and the premiums offered were:—1st, 100*l.*; 2nd, 100*l.*; and 3rd, 75*l.*

Mr. Burnet reported, says the *Scotsman*, that twenty-eight sets of plans had been sent in and that the competition had been of a very high order. The sets of plans sent in were numbered in the order received, and the assessor intimated that his awards were as follows:—1st, No. 17; 2nd, No. 3rd, No. 14. On the sealed envelopes being opened it was found that the architects receiving the awards were:—

1. John A. Campbell, F.R.I.B.A., 124 St. Vincent Street, Glasgow.
2. Walker & Ramsay, 123 Wellington Street, Glasgow.
3. T. Duncan Rhind, A.R.I.B.A., 28 Rutland Street, Edinburgh.

Acting on a power reserved in the conditions of competition, it was resolved, while giving (as awarded) the first premium to Mr. J. A. Campbell, to accept the plan of Messrs. Walker & Ramsay for the exhibition and to appoint that firm the architects. The designs were displayed in three of the rooms on the first floor of the Synod Hall, and the committee adjourned their business for a time in order to give all the members an opportunity of inspecting the premiated and other plans.

Mr. Campbell's Plans.

The main entrance to the exhibition is placed in the design in Balgreen Road. A spacious circular-headed doorway, flanked by campanile (Venetian) towers rising to a considerable height, is a fine feature of the design. The elevation of the range of buildings on each side is broken up with ornamental pilasters and terminates in decorative

gables. The entrance hall, with circular-headed glass roof, is carried forward to meet a long oblong building set north and south, marked "Industrial Hall." On the west side of this hall, but detached from it, is the concert hall, with pleasing elevation, approached by covered corridors on each side, and beyond is a "central (open) square," with main avenues, fairy fountain, &c. The machinery hall is placed on the north of this square, and the fine art gallery with conservatory to the south. In the grounds of the old Saughton mansion-house are shown sites for a castle and Scottish village; the mansion-house itself is utilised for administrative purposes and a museum (it will be that in any case), and at the Gorgie corner, where the car line terminates, and where a new bridge is to be erected, an entrance is placed with avenue leading through the gardens to the exhibition grounds proper.

Messrs. Walker & Ramsay's Plans.

The requirements of the exhibition as set forth in the conditions of competition were an industrial hall of 100,000 square feet, a machinery hall of 20,000 square feet, a concert hall to seat 2,000 persons, an art gallery of 15,000 lineal feet of wall space so arranged as to be easily extended by 2,000 lineal feet, and a winter garden of 3,000 square feet. Having regard to the limit of cost which was specified, the problem set to the competitors was not an easy one. In the design selected it has been solved by the adoption of timber construction throughout for all the buildings, except in the case of the fine art gallery. Messrs. Walker & Ramsay, it may incidentally be stated, did a considerable amount of work in connection with the last Glasgow exhibition, including the Canadian pavilion. They were the architects of the Wolverhampton exhibition of 1902, and of the Coronation Arch in Whitehall, London, for the Canadian Government in the same year, so that they are not inexperienced in this class of work. According to the plan submitted the buildings proper of the exhibition are placed on the north-east section of the ground, as suggested in the conditions of competition. The industrial and machinery halls form one building, with front and main entrance to Balgreen Road. Towards the grounds this building is planned by throwing out two wings (one of which is the machinery hall) to form three sides of a square or courtyard. The fourth side is completed by the concert hall, with connecting covered ways to the wings. Externally the appearance of the buildings depends less on unnecessary details than on their main proportions and outlines. In the front of the main building facing the grounds this effect is attained by placing the concert hall (circular in shape) with its domed roof in the centre, and finishing the ends of the flanking wings with large and imposing towers. This front is opened up with arcadings, which will form tea terraces overlooking the grounds. Altogether the style of architecture is light and appropriate to a building of the kind. Whilst the structural framing of these buildings is of timber with outside walls of fibre, plaster and lathboard, the fine arts gallery is of light steel, filled in with brick and coated externally with stucco to form the walls. This is to make it fireproof. Except in the case of the concert hall, in which board-covered canvas decking is used, all the roofs are of corrugated iron. The fine arts building, with winter garden in front, is placed in the centre of the north-west boundary of the grounds. Its design is simple and pleasing, and the principal feature is the main entrance, topped with a dome. It is rectangular in shape, and comprises seven galleries. In the laying out of the grounds ample provision has been made for the entertainment and amusement of the visitors. A lake with illuminated fountain has been placed in the centre. On either side of this run wide avenues from the tea terraces in the main buildings to the sports enclosure at the opposite end of the grounds. Among the outdoor attractions provided will be a waterchute and switchback railway. Saughton House grounds will mostly be utilised for purposes of amusement.

Mr. T. Duncan Rhind's Plans.

In Mr. T. Duncan Rhind's design the main entrance is placed in the angle of the ground at the north end of Balgreen Road, facing the road from Murrayfield, which will be the principal route to the exhibition from the city. The plan shows a lofty domed entrance hall of dignified proportions, the doorway, deeply recessed, being flanked by square towers with domed tops and finials. The main industrial buildings are arranged along Balgreen Road and the northern side of the grounds, and form a screen from the east and north winds to the central open court, where

the bandstand is placed, and a like service is partially rendered on the west side by the concert hall and by the art gallery, the latter of which occupies a detached site on the south-west side of the park. As in all the plans, the ground for sports is shown to the west of the exhibition buildings. The central open court is suitably laid out with fountain, flower-beds and walks. At the Gorgie side the bridge over the Water of Leith is placed not in the angle at the south end of Balgreen Road, but a little further west, which permits of a straight avenue being formed through the grounds of Saughton mansion-house, and the placing of a winter garden in a circular space in the centre. On the river to the west of the mansion-house are shown a waterchute, rustic bridge, &c.

The plans were on exhibition in the Synod Hall during the week.

AN OFFICIAL COMPETITIVE EXAMINATION.

IN April an examination was held by the Civil Service Commission for four appointments as assistant architect and surveyor in H.M. Office of Works. There were nineteen candidates. The subjects were:—Drawing and design of architectural works—details of construction, 800 marks; specifications, 100 marks; quantities and estimates, 100 marks; use and properties of materials, 100 marks; surveying and levelling, 100 marks; sanitary engineering, 100 marks; principles and practice of valuation, easements, &c., 100 marks.

The subject for design was a building for city offices and shops in principal street, with existing buildings on each side, the site rectangular, length 130 feet and frontage 50 feet. The front elevation to be architecturally treated, without restriction as to style. Accommodation to be provided to consist of two shops, and an entrance to offices on the upper floors to be provided on the ground floor. Each shop to have a parlour and lavatory, &c., with nearly the whole of the basement for storage. Offices to be planned on the first, second, third and fourth floors. The drawings required were ground-floor plan, first-floor plan, fourth-floor plan, longitudinal section, front elevation, to a scale of 8 feet to 1 inch.

(Details of Construction, including Theory of Construction in Architectural Works.)

Four questions only to be answered.

1. Draw, to a scale of 2 feet to 1 inch, longitudinal and transverse sections showing part of a timber-framed roof over a public arcade 30 feet wide. Ventilation to be provided for and a detail of the system of glazing proposed.

2. Draw, to a scale of 2 feet to 1 inch, plan and section showing the construction of a stone staircase from ground floor to first floor for the corner entrance of a public building. It is to occupy a circular space 14 feet in clear diameter, surrounded by a 14-inch brick wall.

3. Draw, to a scale of 4 feet to 1 inch, a transverse section through a one-storey refreshment-room built into the side of a chalk hill where the ground slopes at an angle of 30 degrees. The walls to be of brickwork with windows in the front, the roof to be of concrete arches finished with asphalt, for a promenade.

4. Draw, to a scale of 2 feet to 1 inch, plan and part elevation of the construction of an external escape staircase of open ironwork, 3 feet 6 inches wide, supported upon columns or stanchions, for the upper floors of a four-storey factory.

5. A conservatory is to be formed at the rear of a terrace house, between back additions spaced 8 feet apart. It is to communicate with a sitting-room 10 feet high, through a window opening 5 feet wide. The opening to have a fan-light above and a pair of casements below. Draw, to a scale of 2 feet to 1 inch, a plan, elevation and section.

Materials of Construction.

Group A.—Give the colour, chief characteristics and uses of the following building stones and the principal localities from which they are obtained:—Ackworth, Craigleith, Idle, Purbeck, Anston and Huddlestone.

Enumerate and describe briefly the distinct layers of building stone found in the Portland quarries. Which would you specify to be used, and how would you insure getting the stone you specified?

What are the chief points to be considered in deciding if a stone is likely to "weather well"?

Group B.—Discuss the suitability of making bricks of strong clay, mild clay or loam, and marls.

Describe briefly the process of brick-burning in clamps and kilns and the comparative advantages of the two methods.

Explain the difference between earthenware, fireclay and stoneware drain-pipes and the method of burning them.

Group C.—Give the characteristics of the following kinds of timber, the uses of each and the chief source of supply:—Spruce, pitch-pine, yellow deal, mahogany, elm and teak.

Describe the different methods that have been adopted for the artificial seasoning of timber.

How are plaster of Paris and Keene's cement made and for what purposes are they generally used?

Questions in land surveying, levelling, quantities and estimates were also given.

The four successful candidates obtained respectively 1,104, 1,101, 1,060 and 1,060 marks.

(Details of Construction, including Theory of Construction in Architectural Works.)

Rough Pencil Sketches only.—A brick pier 3 feet by 3 feet on plan has to carry a load of 60 tons. Draw a section of the foundation it requires, assuming that the site is stiff yellow clay. State the materials to be used and give your calculations.

Give sketches of reinforced concrete as applied respectively to foundations, floors, piers and retaining walls; also state the principles of construction.

Draw, to a scale of 2 feet to 1 inch, plan and elevation of a rolled steel stanchion suitable for carrying the floor of a warehouse 11 feet in height from floor to floor with a load of 45 tons upon the stanchion.

Sketch a scarfed joint for a timber beam under compression, also for one in tension, also draw one other method of lengthening timbers.

Sketch detail sections of the construction of the following:—(a) a French casement window to open inwards, (b) ditto ditto to open outwards, (c) a deal lifting skylight in a sloping slated roof, showing the plumber's work.

Sanitary Engineering.

Six questions out of ten to be answered relating to drainage of stable, dryness of building, testing drains, ventilation of hall, sewage purification, &c.

THE ASSOUAN DAM.

THE following report by Mr. Somers Clarke on the proposed raising of the Assouan Dam has been sent to the Society of Antiquaries:—

In January last I wrote from Egypt suggesting that the Society of Antiquaries should formulate a resolution and communicate it to the Egyptian Government in relation to the destruction which would overwhelm the antiquities in Nubia if the dam at Assouan be raised 23 feet above the present level, and to the undertaking which the Egyptian Government had given that the said antiquities should receive every consideration that was possible.

It cannot fail to interest the Fellows of the Society to know that our representations have not been in vain, and that the care already taken to maintain the remains on the island of Philæ is to be extended to those temples and other places of archaeological and architectural interest which will be submerged when the enlarged reservoir is full.

In the *Times* of April 23 some extracts were given from a Parliamentary paper known as "Egypt, No. 2. Despatch from the Earl of Cromer respecting the water supply of Egypt."

In justice to the Government of Egypt it should be stated that these extracts do not by any means give an adequate account of the liberal and enlightened spirit in which the difficulties of the case are being met. Indeed, it might be supposed that around Philæ alone was the fresh work of investigation to be centred. As a matter of fact, in order to avoid if possible the submersion of the antiquities, all parts of the valley between Assouan on the north and Khartoum on the south were carefully examined by a commission especially appointed for that purpose; the geological formation was studied, and the conformation of the valley observed with regard to the capacity (a) for the storage of a large body of water, (b) economy of construction, (c) materials at hand for such construction, (d) safety.

Having regard to the quantity of water that can be impounded with a wall of a given height, it is now proved that no place offers such conveniences as Assouan. Not less than 14,000*l.* were voted for the investigation and necessary survey.

That which especially interests us is the following question, What steps will the Egyptian Government take to examine, survey, and to preserve and, finally, to give to the world the results obtained? We must bear in mind that not only archæology and architecture will suffer; but also ethnology, botany, and, indeed, nearly all kindred sciences.

The swamping of any part of the Nile Valley is, for us, its destruction.

The survey of that part of the valley which will be submerged has, to a considerable extent, been initiated during the examination already referred to.

An archaeological survey is to be taken in hand, no effort being spared to render this as complete and thorough as possible. In this survey will be included all temple and town sites, cemeteries, and all other indications of ancient civilisation. Plans of these will be prepared to a large scale.

Copies will be made of all inscriptions, whether on walls or rocks, beginning with those which will be first submerged. The ancient cemeteries, &c., will be excavated and everything will be recorded.

The temples and other ancient buildings that can possibly be affected by the increased level of the water in the reservoir will be underpinned, fortified, and at the same time measured and drawn.

Lastly, the result of all investigations will be published to the world.

The sustentation of the temples will be undertaken by the Department of Antiquities, under M. Maspero. The rest of the work is placed in charge of Captain Lyons, R.E. Those who have the pleasure of knowing this gentleman are well aware of the admirable method, care and thoroughness which he brings to bear on every work he undertakes.

The organisation of the great work is already begun. The Egyptian Government has voted 60,000*l.* in order that it may be carried out in its integrity. We may be glad that the suggestion for pulling down and re-erecting on another site part of the ruins at Philæ has not been entertained.

LEWES CASTLE.

LOOKING at the stately ruin which towers above the county town of Lewes, it is curious to remember, says the *Sussex Daily News*, that in the time of King James I. the flints of which the castle was composed were actually sold at "fourpence a load." Probably just after the union of England with Scotland there were many jealousies and strifes among the nobles, and it was deemed expedient that such strongholds should not be in working order. The fiat thus went forth for their destruction, and the "simple" inhabitants joyfully availed themselves of the opportunity to get cheap building material for their humble dwellings and for the repair of their roads.

The massive walls, part of the gateway, two towers of the keep, and probably innumerable minor buildings were pulled down, rendering the castle useless as a fortress, but happily enough is spared for one to realise what an important place it originally was. How astonished the builders and the destroyers of those massive walls would have been could they have foreseen the crowd of sightseers who in the twentieth century would cross the moat and climb the steps to the keep to admire and conjecture about the early days of the structure.

From the various landing-places of the stairway an excellent view is obtained of the castle gateway, with its towers and arches, in which may still be seen the grooves in which the portcullis was lowered for safety at night. The walls in early summer are gaily draped with orange wallflowers, ivy-leaved toadflax and dense tufts of wall pellitory, while at their base are clumps of Alexanders with golden-green umbels of blossom, a plant which is more frequently found near ancient buildings, and may have been cultivated by our ancestors either for food or physic.

The first "curiosity" displayed at the top of the steps can but raise a smile from those acquainted with rural Sussex. An ancient plough it may be, but scores of ploughs of this precise pattern are still turning the long furrows of the arable "layings" on the South Downs. We have not altogether turned to the plough which runs to and fro between noisy steam-engines, or even to the iron double-furrow. Within the courtyard of the keep other relics are much in need of better care. Rude and fragmentary as the old canoes cut from a single tree trunk are, they are things most unlikely to be found again, and

it is a great pity that they should be exposed to the humid atmosphere of English winters. Perhaps when the Sussex Archaeological Society settles down in its new home room will also be found for the canoes as well as other things.

Entering the southern tower, what a medley is seen. Curios of all periods in grievous need of sorting are crowded together, and some preventive measures should be taken to arrest the ravages of time. For instance, just opposite the door are some old trenchers and a long-handled wooden strainer—probably a dairy implement. These are riddled with wormholes, and if the insidious little drab woodbeetles hatch out with the summer warmth they will soon spread to the antique chairs, carvings and other valuable wooden relics around. In the tapestry-room of the gateway there is a fine old spinning wheel in the same state. Cannot some enterprising chemist devise a dressing which will check the woodbeetle and the crumbling of age and preserve these interesting instruments of a past age?

Just within the doorway are two rather stumpy alabaster figures, said to have been brought from Hurstmonceux Castle. A vast quantity of curios and works of art were sold there about a century and a half ago, when the Hare family migrated from the Mediæval castle to the more modern residence in the upper park. Over the doorway are hung two large bunches of gilded grapes, which probably swung over the doorway of some inn. With them is a curious little wooden figure, representing an infant Bacchus astride on a barrel, and near by are several specimens of old constable's staves. One is so well accustomed to the sight of the helmeted policeman, even in country lanes, that the rising generation hardly know that within middle-aged memory he did not exist, and some decent man in each parish was sworn in as constable and given a short staff, armed with which he felt himself the repository of all the dignity of the law. When the staff was displayed the evil-doer knew he must behave himself, and the shout, "Just bring me out my staff, missus," has quelled many a petty squabble on the village green. In the glass case below are various mummy fragments, which have nothing to do with local history, including that gruesome nightmare to child visitors, the hand which was torn so cruelly from its arm. It is doubtful if the public exhibition of such horrors serves any good purpose.

The upper rooms of the south tower are surrounded with careful rubbings from many of the best monumental brasses in Sussex and with the coats-of-arms of the leading families of the county, many, of course, now extinct. Numbers of fragments of carved stone and beautiful encaustic tiles are here, brought from the great priory below, whose despoilation seems even more barbarous than that of the castle.

Here, too, is a primitive cheese press, which ought to be displayed with the spinning wheel, rush-holders and other relics of Sussex farm life in the eighteenth century. It is a relief to step from the somewhat musty rooms to the free, fresh air at the top of the tower. But we have by no means exhausted the museum. In the western tower is a really excellent collection of chipped flint implements and much interesting pottery, notably a large jar which was dug up in the foundations of Hellingly asylum. Near by is a very curious relic of the Roman invasion. This is a bronze helmet, to which a pearly, flat oyster-shell is firmly affixed. It was dredged up off the West Sussex coast. It seems most likely that some Roman soldier met his death at the hands of the British, who endeavoured to drive off the intruders, and, encumbered by his armour, was drowned, the imperishable bronze of the helmet lasting on to tell the tale all through these centuries.

Descending to the rooms of the gateway, the first thing to be noticed is the collection of fine old Sussex iron fire-backs and "dogs." In spite of modern inventions, these seem likely to return to use. A gentleman in Essex recently had one cast for his hall, but was astonished to find the founder had copied the antique pattern too literally, even to the seventeenth-century date. It was promptly returned, the owner objecting to having a cast-iron lie always before his eyes.

In spite of the dark and crowded rooms, it is easy to see how fine are the many pieces of valuable tapestry presented by a former Earl of Chichester. The stitches are so tiny and even that they represent a stupendous amount of work done by industrious dames of old. The colours are wonderfully fresh, and the designs, especially those of the incidents in the life of Moses, must have been drawn by no mean artist.

THE BELFAST CITY HALL.

IN the King's Bench Division, Dublin, before Mr. Justice Boyd and Mr. Justice Wright, an application was made in an action brought by Sir Alfred Brumwell Thomas, architect, London, against the Corporation of Belfast.

Mr. Harrison, K.C., on behalf of the defendants, applied for an order for fuller and better particulars as to certain portions of the cause of action, and also for extension of time to plead to the action. The action was one by Sir Alfred Brumwell Thomas, architect, carrying on business in London, against the Belfast Corporation to recover certain moneys in respect of his fees as architect of the new city hall in Belfast. In his statement of claim he sued for 13,708*l.* 15*s.* as still due to him, after giving credit for 8,050*l.* already paid, and he did that without prejudice to any claim which he said he was keeping up his sleeve. His claim was set out in a number of alternative ways in the pleadings, and he claimed not only under the original contract, but also for extras. The particulars given with respect to some of the claims were deemed by the defendants to be insufficient, and hence the present motion. That the details within their power to give might have been more satisfactory was evident from the fact that in the affidavit filed to resist the motion they had given very full particulars of everything except one claim. Plaintiff in framing his action relied in the first place on the original contract, which was arrived at in this way. Architects were asked to compete for a 100 guinea prize for the best design for a new city hall, to be completed within four years, and not to cost more than 150,000*l.* The design which plaintiff sent in was accepted, and thereupon the defendants entered into a contract with Messrs. H. & J. Martin, Ltd., to build the city hall at a cost of 149,864*l.* 5*s.* 10*d.* Plaintiff's first claim was for 5 per cent. on that, and there was no dispute on that part of his case.

Mr. Campbell, K.C., who appeared on behalf of the plaintiff, said he might shorten matters if he mentioned that they would give defendants until the 10th inst. to plead if they agreed to accept short notice of trial.

Mr. Harrison said he would be content with that date, but he could not take short notice of trial.

After some discussion amongst counsel, it was agreed that the trial should be set down for the 20th inst., and that defendants should have until the 10th to put in their defence.

Mr. Harrison said plaintiff had a claim for 3,750*l.* in respect of damages, and they wanted better particulars as regards that. Plaintiff said the original contract was for 149,000*l.* odd, but that with the addition of a great number of extras it was increased by 70 per cent., and he claimed 5 per cent. on that. In the third place he claimed 2½ per cent. on those parts of the original contract which were abandoned. Plaintiff's course was rather peculiar, because after claiming damages for the extended period of the contract he also claimed percentage on the extra money expended during that time. Counsel submitted that plaintiff should be required to give particulars of the damage which he alleged.

Mr. Campbell said the answer was obvious. They had to maintain their office and staff during the extra time at, of course, very considerable expense. The original time was to be four years, and it finally ran up to nine years.

Mr. Harrison said the plaintiff's claim was formulated in this way:—5 per cent. on 120,000*l.*; 2½ per cent. on 149,000*l.*; 3 per cent. on 12,119*l.* for office furniture, and 3 per cent. on 20,240*l.* for other things that were tendered for and not gone on with. If he succeeded on these items he would be getting paid for his delay without at all having this claim for damage about which they complained of the want of particulars.

Mr. Campbell said it was plaintiff's interest as well as theirs that the amount should be expended in as short a time as was possible, and the contract provided that the amount was to be expended in four years. Instead of four years, by alterations in the design and so forth, by fighting amongst themselves and fighting with their contractors, Messrs. Martin, the buildings were not completed for nine years. Plaintiff said that as a result of that he had to keep his office and staff in Belfast for nine years engaged in earning a sum which he should have earned in four, and that, therefore, he was entitled to be paid for his extra time.

The Court, according to the *Irish Times*, made no rule on the motion for particulars, and set down the hearing of the action for the 20th inst., defendants being allowed until the 10th inst. to deliver their defence. Costs were ordered to be costs in the case.

GENERAL.

The Honorary Degree of D.C.L. is to be conferred by Oxford University on M. Auguste Rodin, president of the International Society of Painters, Sculptors and Gravers; Mr. George Frederick Bodley, R.A.; and Mr. Hubert von Herkomer, R.A., Hon. Fellow of All Souls College. Mr. Sidney Colvin, keeper of paints and drawings in the British Museum, is to receive the honorary degree of D.Litt.

Count Plunkett, at the opening of the Irish Home Industries section of the Dublin Exhibition on Saturday, stated that the Arts and Crafts Society of Ireland aimed at elevating popular taste and showing the connection that exists between art and industries. The difficulties in the way of Irish enterprise had been trebled for the craftsmen, but much good work had been done, and the refining influence exercised by the Society had done much to develop the skill and talent of our workmen.

The Competition for the prizes of the French Society for the Encouragement of Art and Industry attracted 242 works. The subject was "A Signboard for the Shop of a Potter." M. Vaudremer, architect, presided at the examination. Of the thirteen prizes four were gained by Paris, three by Lyons, two by Maçon, two by Nantes, one by Tours and one by Rouen.

The Médailles d'Honneur of the Paris Salon have been awarded as follows:—Architecture, M. Louis Jean Hulot; painting, M. Henri Martin; sculpture, not awarded; engraving on medals, M. Frédéric Vernon; engraving and lithography, M. Abel Mignon.

Mr. A. Scott, M.Inst.C.E., who had the control and carrying-out of the new harbour and dock works at Gibraltar for the Admiralty, has been appointed engineer-in-chief and technical adviser to the Chilean Government for harbour works, and will leave shortly for Chile.

The Partnership between Messrs. Colson, Farrow & Nisbett has been dissolved by mutual consent. Mr. Frederic Richard Farrow, F.R.I.B.A., will carry on his practice as architect and surveyor at the old address, 29 New Bridge Street, Ludgate Circus, London, E.C.

The Dean and Chapter of St. Paul's are about to determine by means of a practical test the safety of the cathedral. Metal discs are to be placed in the pillars in the crypt and elsewhere, and later by accurate measurement it will be possible to settle definitely whether or not the building is stable.

At an Auction held last week at Worthing a key, which came into the possession of the late Mr. George Truefitt, F.R.I.B.A., of Old House, Heene, Worthing, was offered for sale with other articles by order of the trustees. It belonged to Mary Queen of Scots, and is believed to be the one used by her to open Earl Darnley's private room in Edinburgh Castle. It was sold to Mr. Rochelle Thomas for 50l.

The Executive Committee of Ayr Auld Brig preservation committee have been informed of the dissolution of the firm of Simpson & Wilson, the committee's engineers. An application was submitted from Mr. W. S. Wilson, one of the partners, asking to be appointed engineer, the other partners being agreeable. The meeting agreed to appoint Mr. Wilson, subject to the acquiescence of other partners, and further resolved to ask Mr. Simpson, one of the partners, to accept the appointment of honorary consulting engineer. The committee agreed to insure the workmen engaged on the preservation work. The hon. treasurer reported further subscriptions, and that the fund now amounted to 10,205l.

A Sub-Committee of the Lord Provost's committee of Edinburgh Town Council accepted an estimate for the cleaning of the Pitt statue and the statue of the Scott monument. Some time ago the statues of George IV. and of Allan Ramsay were treated in a similar manner.

At the Annual General Meeting of the Royal Society of British Artists, Mr. Alfred East, A.R.A., was re-elected president, Mr. Boot vice-president and Mr. Watt Cafe hon. secretary; Mr. Walter Fowler was elected treasurer, and Messrs. J. Finemore and W. M. Palin auditors, Mr. W. Edward Riley, F.R.I.B.A., and Mr. Hodgson Liddell members of Council. Mr. Thomas Brock, R.A., was elected an honorary member. The President has presented to the Society a presidential badge specially designed by Mr. George Frampton, R.A.

The Competition for the Palais de Justice in the Bulgarian capital has been awarded to a French design signed "Lux, Pas, Jus," of which the authorship is not yet announced.

The Late Alderman G. B. Woodruff, the first European representative of the Singer Sewing Machine Co., bequeathed 10,000l. to the vicar and churchwardens of the new parish church of All Saints, Hove, for completion of tower and west porch of that church.

The Dover Corporation have decided to place stained-glass windows in the town hall as a memorial to Dr. Askley, a local philanthropist, who recently died, and during his life had given about 30,000l. to local institutions.

The Foundation of the church of St. Cæsarius has been unearthed in the course of excavations at the Villa Mills, on the Palatine Hill, Rome. It was the private chapel of the first Christian emperor, and existed up to the fourteenth century.

The Hawarden Parish Magazine announces that the present east window in Hawarden parish church is to be replaced by a very beautiful design by Sir Edward Burne-Jones. The subject will be the same, and the new window will have the same memorial character. It is to be the gift of Mrs. Drew. The magazine states that the present window is by no means worthy as a work of art to occupy the most important place in the church.

Messrs. John Boulting & Sons, of Upper Marylebone Street, W., have opened a branch establishment of their business at 51 Bishopsgate Street Within, E.C., under the control of Mr. William Good.

A New Unionist Club is in course of erection at Aston Cross, Birmingham. The architect is Mr. A. G. Latham, of Temple Row, Birmingham.

Mr. W. Bevan, F.R.I.B.A., has removed his offices from Parliament Chambers, Great Smith Street, to 2 Old Queen Street, Westminster, S.W.

The Limited Competition for the Shortlands Congregational mission hall has been settled in favour of designs submitted by Messrs. Geo. Baines & Son, 5 Clement's Inn Strand, London, W.C.

In Opposition to the municipal buildings scheme of the Coventry Corporation a memorial to the Right Hon. J. Burns, the President of the Local Government Board, has been issued, and has been numerously signed. It sets forth that the memorialists object to the borrowing of the sum of 30,000l. for the purpose of erecting municipal offices and shops on the Earl Street site.

The Secretary of the Local Government Board in a letter points out that having regard to the provisions of the Workmen's Compensation Act, which will come into force on July 1, that local authorities generally will be employers within the meaning of the Act, and that to the extent to which in that capacity they will become subject to liability which may be met by insurance, they may properly incur reasonable expenditure in effecting an insurance against their liability under the Act.

The Nottingham Architectural Society paid a visit to Southwell on Saturday, when the members were met by Mr. W. D. Caröe, the architect to the Ecclesiastical Commissioners, who has been instructed to design a new residence for the bishop, incorporating in the building the ruins of the ancient archiepiscopal palace associated with the name of Cardinal Wolsey. The additions to the ancient walls, laying-out the grounds, &c., are estimated to entail an expenditure of 9,000l. There are forty-nine rooms, large and small. When the bishop is entertaining a large party of guests the ancient archiepiscopal banqueting-hall will be used. A new private chapel has been constructed, one side being part of the old wall and having a lofty roof of English oak. The cost of the chapel is estimated at 700l. In the upper storey of the house are dormitories for candidates when spending quiet days with the bishop before ordination. Mr. Caröe showed the party over the Minster and new house. Afterwards the contractor entertained the visitors to tea at the Saracen's Head Hotel, made famous as the hostelry where Charles I. surrendered to the Commissioners of the Scotch Army.

The Directors of W. & T. Avery have decided, subject to audit, to pay a dividend on the ordinary shares of 15 per cent. for the second half of the year, making 10 per cent. for the year.

The Architect.

THE WEEK.

WHEN the late Mr. SLADE founded professorships of fine art in Oxford, Cambridge and London it was arranged that the professor, who was to hold office for three years, should deliver twelve lectures each year, and that no lecture was to be twice repeated. It is now proposed to alter the regulations so far as they relate to the University of Cambridge. The tenure of the chair is to be permanent after a preliminary period of three years, instead of for three years only as at present. The professor will have to deliver at least twenty-four lectures each year, and it shall be also his duty to organise and develop the study of art in the University. The professorship is to be precluded from being held together with any other University professorship, readership or lectureship. The proposals were put forward by the Board of Electors to the Chair with the object of removing the Slade Professorship from the category of occasional lectureships, held often by distinguished men from outside the University, like the Chair of Poetry at Oxford, and making it a permanent post, with the object of extending the study of art in the University. There was opposition at the congregation on the 6th inst., more particularly to the last of the proposed regulations, on the ground that the stipend of the chair (360*l.*) was not enough to justify debarring the professor from holding another University post. A large majority, however, upheld the scheme of the Board of Electors.

ABSURD stories sometimes get into circulation concerning the power which an architect is supposed to have over the financial arrangements connected with buildings. Talk of the kind may be carried on for a long time and may do injury to architects, while they are deprived of an opportunity to defend their character. A case of the kind was heard last week by Mr. Justice PHILLIMORE at the Suffolk Assizes. Mr. WINKWORTH, an architect and surveyor, of Ipswich, brought an action for slander against a Mr. FULCHER, who was a builder's traveller. It appears that in 1902 plaintiff acted as architect for a Mr. NORTHFIELD and a Mrs. WAINWRIGHT, and satisfactorily carried out his duties. In 1906 plaintiff was engaged in some litigation about land with a Mr. HUNT. The defendant at a subsequent time called upon the plaintiff, and asked to have a private conversation with him, but before they were alone said in the hearing of a clerk:—"I have got a serious accusation to make against you. Unless you make the land over to Mr. HUNT on the Roundwood Estate, I shall inform Mrs. WAINWRIGHT, and Mr. NORTHFIELD's solicitors, that you robbed them of 100*l.* over their contract for the Gainsborough Road houses two or three years ago." The defendant in his evidence said that the plaintiff and himself had been good friends, that he called on him respecting an order from plaintiff's brother for slates, and he admitted that he threatened, unless the HUNT business was satisfactorily settled, to reveal that a deficiency in quantities on one set of houses was made up by charging other clients with the difference. After hearing evidence there was a consultation, and defendant's counsel withdrew all allegations against plaintiff, apologised, and consented to judgment for ten guineas and costs. In this case the defendant's indiscretion enabled Mr. WINKWORTH to have the slanders investigated. Otherwise they might have continued to injure him during many years. The defendant imagined there was no witness present to hear his words, and he may have endeavoured to secure immunity on other occasions.

It is always amusing to witness a contest between authorities respecting buildings, especially when the public are not heavily charged for the litigation on both

sides. An instance has occurred in Doncaster. That interesting town has the privilege of possessing an Act one section of which declares that the making of any addition to an existing building by raising any part of the roof or making any projection shall for the purpose of the Act be deemed the erection of a new building. The offices in connection with the local county court required enlargement. The Registrar lodged a plan which the sanitary committee of the Council declined to approve. A revised plan met the same fate. In spite of the opposition the building was altered. Three summonses were taken out against the Registrar and his builders for breaches of by-laws. The defence was that the building was exempted because it was used for public purposes. The Bench, after hearing evidence and speeches, came to the conclusion that the exemption did not apply and they could not regard it as a public building. Regret was expressed that matters should have become so strained between the parties, as an improvement had been made. The premises were very much better than before the alteration, and nothing of a sanitary character had been injured. The small penalty of 1*s.* and costs was imposed and the summonses against the builders were dismissed.

THE Institute's schedule says that the 5 per cent. commission is to include "examining and passing the accounts, exclusive of measuring and making out extras and omissions." But it is also stated that additional charges can be made in the measurement and valuation of extras and omissions. Local Government auditors apparently do not approve of any charges of the latter kind. At the last meeting of the Stoke education committee a report from the auditor was read which stated that it was only with great hesitation and after consultation with the chairman of the committee that he passed a payment of 4*l.* 3*s.* 7*d.* to the committee's architect, which payment was included in the final payment on a building contract. The auditor found that the architect had received 2½ per cent. on the tender from the contractors for taking out the quantities, 5 per cent. from the authority on the whole contract for plans, supervision, &c., and the further payment of 4*l.* 3*s.* 7*d.* from the contractors for "surveyor's charges for settling the final account." That charge was unprecedented in his experience. He thought it most desirable that architects who were employed by the authority should receive all their remuneration, including that for quantities, from the authority and none from the contractors, and he trusted that in future contracts the authority would see their way to enforce that rule. It is considered to be "desirable" that the architect should be paid by the client rather than by the builder for all charges for taking out quantities. But in practice that rule cannot always be insisted on. Government auditors could not prevent payment by a builder, although if it were announced from Whitehall that only the payment directly by local authorities would be recognised, a change in the common practice might follow.

THE Paris Opera House is about to have new directors, who have stipulated that the condition of the building should be improved, which means an immediate outlay of about 24,000*l.* Over 2,600*l.* will have to be expended on sanitary improvements. Upholstery will cost about 8,000*l.* Cleaning of the public parts, such as the foyer, staircases, &c., will cost 1,100*l.* Reparations of furniture will require another 1,000*l.* Renewing a part of the flooring is estimated at 400*l.* The heating apparatus is in such a condition that unless there is a change the house cannot be warmed during the coming season. For that work 1,750*l.* will be required. Repairs of corridors will cost 800*l.* Electric wiring, &c., is estimated at 4,100*l.* Various other repairs will cost 1,100*l.*, and 3,000*l.* is allowed for contingencies, expenses of direction, &c. The Opera House belongs to the State, and it will be necessary for the money to be voted by the Legislature.

DANISH EXPLORATION.

DURING this week London has been welcoming the King and Queen of DENMARK. There are bonds between their country and Great Britain which are of a most interesting kind, and which it is to be hoped will be again and again renewed. But it is well to remember that a century ago Denmark was all but deprived of its existence as an independent kingdom, and mainly owing to the acts of Englishmen. In 1807 the entire Danish fleet surrendered to England, and that event was soon afterwards followed by the ceding of Norway, which was then a part of Denmark, to Sweden. Happily those trials have ceased to cause any bitterness between the two countries. Denmark has regained her position, and it must be acknowledged that the arts had no small share in the recovery. Statuettes after the works of THORWALSDEN have for several years been familiar in London, and indeed in many other European capitals. Other sculptors have followed THORWALSDEN, and by the patriotism of M. JACOBSEN their works have been purchased for the nation, and a fine gallery erected to contain them in Copenhagen.

There is a close connection between sculpture and exploration. As France, Germany, Italy, and we may add America, lands in which sculpture is esteemed, have wished to gain renown by the discovery of ancient masterpieces, it was allowable for the countrymen of THORWALSDEN to imitate their contemporaries. M. JACOBSEN again displayed his liberality in providing the money required. All the most eligible parts of Greece had been already assigned, and the Danes have therefore to accept a portion of Rhodes as a field for their operations.

Rhodes has some fitness for exploration by a people who had so unexpectedly displayed skill in sculpture, and for subjects which were mainly inspired by Greek mythology. The island had at one time gained renown as a school of sculpture. The "Colossus of Rhodes," which was a great figure of HELIOS the sun-god, was supposed to be one of the seven wonders of the world. It may not have passed as a noble work, if judged by a high standard. But it suggested one of the characteristics of Rhodian art. As well as can be made out the Rhodian sculptors endeavoured to produce figures on a large scale and in intricate groups. It is also supposed that they wished to excite terror, or something approaching it, by their representations. The complicated group of the *Farnese Bull*, now in the Naples Museum, but which at one time adorned the Baths of Caracalla in Rome, is regarded as one typical example. The more admired *Laocoon*, which was formerly in the Baths of Titus, is believed to be another Rhodian work. It does not follow that sculpture of a different class was not produced in the island. Portrait statues by Rhodian artists were much sought after. There were also painters; and if one legend can be accepted as evidence they also had a weakness for tragic scenes. A man, it was said, was put to the torture in order to become a model for the figure of the suffering PROMETHEUS.

The Danes have therefore reason to suppose that in an island where so many ancient sculptors lived relics of them shall be found. It was no doubt believed by many inquirers that as traders visited Rhodes during its possession by the Romans, the Byzantines, the Knights of St. JOHN and the Turks, any ancient example which was likely to have value was sure to be removed. The Christian knights were without much reverence for ancient art, and they had no misgiving about using carved stones in walls and fortifications. The city of Rhodes especially was supposed to be clear of pagan remains, and it was doubtful whether other parts of the island were likely to be more fruitful.

The Danes have not the money at command which would allow them to make many experiments. Their operations have been mainly confined to Lindus, which

stands at about the middle of the eastern coast-line. It was formerly one of the three principal cities, and subsequently became a member of the Hexapolis, or six combined cities. CHERES, the sculptor of the colossal sun-god, was a native of Lindus, and it was reasonable to assume a work by him or one of his contemporaries would be unearthed, although the Knights of St. JOHN had erected a castle near the village.

Up to the present no remarkable work has rewarded the enterprise and industry of the Danes. As in other places, the remains of the ancient public buildings have been brought to light. Lindus possessed a temple which was dedicated to ATHENÉ. It has also been found that about the time of HADRIAN importance was attached to the place, for evidently the walls were reconstructed by Roman masons. Numerous inscriptions were also met with, but their value as historical evidence remains to be ascertained.

What appears to be most interesting about the place is that Lindus seems to have been a cultured city. Indeed, it may have had some analogy with an English cathedral town. Many philosophers belonged to the island, and it is easy to imagine they would prefer Lindus to Rhodes, which, as the capital and the principal seat of trade, would not be so well suited for men who gave their days to reflection, and some of whom were likely to be prone to mysticism.

If, however, there is nothing resembling the *Laocoon* left in or about Lindus, the Danish explorers have to the satisfaction of knowing they are endeavouring to extend our knowledge of one of the Greek races. There is the authority of HOMER for the belief that Rhodians took part in the expedition to Troy. The poet says that proud Rhodians came in nine ships, under TLEPOLEMON, a son of HERCULES, who ruled the island in which the people lived in three separate tribes, viz. those of Lindus, Camirus and Ialysus. At a subsequent time the Rhodians, who as islanders knew how to utilize the sea, founded colonies in Italy, Sicily and Spain. From the position of Rhodes it was often open to invasion on all sides, and in consequence the tribes found it advantageous to form a league. But there were internal dissensions from which the islanders long suffered.

It suggests the dangers to which Rhodes was liable when we learn that the Colossus which we have referred to before was paid for by the sale of the war engines which on one occasion were employed against the city of Rhodes without success. The figure is said to have been overturned in an earthquake, and this may explain the omission of it from the inventories of PAUSANIAS.

A people who preferred immense statues must have had lofty buildings to contain them. All that is recorded of Rhodes as a city—and such a town as Lindus may have borne a resemblance to it—suggests wide and straight streets, massive fortifications broken at intervals by tall watch-towers, and an absence of the irregularity in streets and houses which was characteristic of Athens. According to PLINY the statues in Rhodes numbered 3,000, a statement which must now be considered as incredible, unless we suppose the sculptors worked in the open and that many of the works were intended for exportation.

Modern explorations do not support the statements concerning the superabundance of sculpture in the island. But as they belong to a maritime race the Danes must have interest in their efforts to uphold the character of the old Rhodians, who if addicted to piratical expeditions were, like other Greeks, lovers of refinement in the intervals of business. The Vikings also loved art, although they preferred to have it in the form of jewellery, rich robes and other aids to personal adornment. The public spirit of the Greeks, by which a city became of more importance than one's home, was unknown in Denmark as in other northern lands.

It is not only in excavations the Danes are now endeavouring to be successful. On Friday last M.

THEODORE REINACH was able to announce to the French Académie des Inscriptions et Belles-lettres a most important discovery. Professor HEIBERG, of Copenhagen, at present pursuing researches in Constantinople, and he has been fortunate in finding a palimpsest on which was inscribed a treatise on Method by no less an authority than ARCHIMEDES. The value of the work is yet to be determined, and, like other ancient examples, it may be incomplete. But in any case the world must remain indebted to a Dane for a treasure which even as a fragment may lead to important results.

EDUCATION OF THE PUBLIC IN ARCHITECTURE.*

THE small volume on the "Essentials in Architecture," by Mr. JOHN BELCHER, A.R.A., might have been prepared for a course of lectures in the Royal Academy. It has not the continuity of thought or that connection between the sentences which we expect in a book. The majority of them are treated as independent paragraphs, and accordingly assume the appearance of discourses. A discourse prepared in that way allows of repeated reference to diagrams, views and models. If the book was not delivered as Academy lectures, the greater part of it however formed, we believe, the address delivered by the author at last year's Congress of Architects in opening the meeting at which the education of the public in architecture was discussed. The summary which appeared at the time forms an epitome of the "Essentials in Architecture." By referring to that report the reader will obtain a clearer idea of what Mr. BELCHER lays down concerning "truth, beauty, strength, vitality, restraint, refinement, repose, space, breadth, scale, proportion, light and shade, colour, solids and voids, balance and symmetry, stone, wood, metals, brick, terra-cotta, cement &c." than from any words of ours. There are seventy illustrations, of which the majority are photographs of Italian buildings. It would be an advantage to the public to be acquainted with the text and the views.

It is, of course, desirable that people in general should be more competent to appreciate architecture. They would then be able to discriminate between the designs of clever architects and of men who may be pretenders to skill. But it is doubtful whether there could be a larger number of buildings erected if the difference between false and true art was more generally realised. That a little knowledge is a dangerous thing has often been proved by the personal experience of architects with clients. While it is still possible to talk as glibly of principles, qualities and factors as in the days when Mr. RUSKIN's books were popular, the most essential and laborious parts of the architect's duties are ignored. This is inevitable with a business in which a large amount of science is demanded, but it occurs also in other of the Fine Arts. There are few painters who would care to inform purchasers of their features about the processes they employed and what kinds of colour they obtained or how long the picture was in hand. That kind of information, although it might be freely imparted to a fellow painter, is not considered as necessary for patrons, however exalted and honourable. The history of the art contains many series of the efforts made to keep a knowledge of the processes from outsiders. MICHEL ANGELO was a reverential Catholic, but he would not allow a tyrannous Pope to see him at work in the Sistine. LEONARDO, who was innocent enough to allow another Pope to witness his experiments, had to pay for the courtesy by the loss of his commissions.

The arts are not the only callings in which it is considered wise to prevent the public interfering on the strength of possessing partial knowledge. Physicians

and lawyers do not go about the world demanding for something to be done to compel the public to understand law and medicine. They presume they will not be called on for their services unless there is a real necessity on the part of clients. The same rule holds good in building, for a great many years must elapse before a man can be expected to order a costly example to express his admiration for architecture.

We suppose there are few architects who would care about the education of the public in architecture if it were not expected that a large proportion would be able to give commissions. One must be sanguine to expect such a result. Considering the peculiar time in which we live, buildings in general must differ in character from those undertaken in a former time. We are now in an age when the old conditions of life are being transformed. With the aid of motors and electric trams it is easy to transact business in towns and yet live, before and after business hours, in districts which railways could not serve. Locomotion has now gained such an ascendancy, the transformation of cities and large towns in order to accommodate traffic has become a necessity. Some theorists have gone so far as to say that distance is so easily overcome there is little use in side streets. The model town should consist of one long street, with numerous lines of rails, and we may one day see a continuous row of houses extending from London to Brighton.

With the world in what may be described as a state of flux old notions about the necessity for permanence cannot therefore be expected to retain their old power. According to Mr. BELCHER:—"A building should certainly be constructed to endure and survive the shocks of time. It must also have the appearance of strength. Like the everlasting hills (or man's counterpart, the Pyramids of Egypt), it must appear to be solidly planted on the soil, and, indeed, to take hold of it." When there is a possibility in a city or large town that a building will, sooner or later, have to be superseded, it does not become persuasive to tell a man who is about to speculate that he must build in the pyramidal manner.

There is also a "getting-on" of another kind in addition to that in which steam or electricity aids. Success is marked by a change or alterations of residence. It is only necessary to look over a few Academy catalogues in order to discover how quickly painters especially seek out new dwellings when their works gain favour. The same process takes place with other men. Commercial establishments become altered under the influence of prosperity. The queer little shop in the Haymarket which Mr. BELCHER has introduced is appreciated by most Londoners because it is a survival which has been unaffected by an increased number of customers. Why is the confectioner's shop in Cornhill so admired, especially by Americans? They hear of successive owners who attained civic dignities and yet who were courageous enough to resist the compulsory force of time, and continued the modest display of eatables during more than a century. Neither the Eastern nor the Western shop would be of much account in an old-fashioned provincial village; but in two of the busiest streets of London they become phenomenal, for they are the exceptions which prove the rule. What are the Palazzo Quaratesi, the Riccardi Palace and similar buildings but survivals like the two London shops? An Italian palace is now a collection of tenements. And to imitate construction which was intended to withstand civil broils in a London residence is almost as absurd as to adopt DANCE's "Newgate" or the Pæstum Temple as a model. The public are shrewd enough to realise the difference between Italian life and our own, and they will hardly care to admire an art in which the advantages would not be commensurate with the cost.

The public who require to be educated have more personal interest in dwellings than in any other class of buildings. Unlike some other writers on architecture,

* *Essentials in Architecture.* An Analysis of the Principles and Qualities to be looked for in Buildings. By John Belcher, A.R.A. (London: B. T. Batsford.)

Mr. BELCHER does not refer to any of his own designing. But the only modern examples of dwellings which he introduces are an imitation of an Elizabethan hall (which is shown as an example of deception) and a suburban house, of which the rent is about 50% a year and which is used for contrast with an old-fashioned Worcester house. Yet the improvement in English houses during late years has astonished foreigners. The majority of the buildings which Mr. BELCHER presents are of a grandiose character—Greenwich Hospital, the Louvre, the Doge's Palace, the Chiesa Della Salute in Venice—all admirable examples of art, but beyond the resources of ordinary clients. Then again Englishmen set greater value on the interiors than on the exteriors of their dwellings. But it is strange that the only example we have of the interior of a residence in the book is a part of the organ gallery of Belton House, with its elaborate carvings of fruit and flowers by GRINLING GIBBONS.

As there is a distinction between theory and practice, modernity and antiquity, there is likewise one between the conditions under which building has now to be conducted and those which formerly prevailed. The Fuller or "Flatiron" offices in New York can never be so impressive in the crowded streets of the city as the Pyramids amidst the sands of Egypt. But the youngest messenger in New York could explain why so lofty a building was erected, and it may be doubted whether any of the ordinary masons employed on the Pyramids knew much about the purpose of the structures. It seems incomprehensible to modern minds that such a mass of stone should be required to protect a few mummies. The old Egyptians were probably as shrewd as ordinary men in our time. But they were not able to judge everything from a utilitarian standpoint, and their financial questions were limited to the amount of taxes which each was compelled to pay. Utility and finance are the two great tests which are now applied to all things. Mr. BELCHER, by restricting himself to exteriors, suggests that architecture is merely the construction of façades for the benefit of those who may look upon them, and throughout his pages he persistently avoids any reference to outlay. While we cheerfully recognise his efforts for the diffusion of knowledge concerning fine buildings, we are afraid that the public would have desired from Mr. BELCHER a treatise of a different kind in order to be enlightened about "The Essentials of Architecture."

THE "ARGYLE LODGING," STIRLING.*

A JAPANESE fortune-teller, who was sincere in believing in the truth of his own system, once told LAFADIO HEARN that the Chinese possessed another still more perfect. According to him, "anyone learned in that science would be able not only to tell the exact time at which any post or beam of a house will yield to decay, but also to tell the direction of the breaking and all its results." If the system could be made familiar in a reasonable time it would save much trouble in designing and in calculation of the strength of materials. There is room for a few of the professors in London; but in America, where so much framing is used, they would be invaluable. They would also be useful in anticipating archaeological investigations. "Buildings, like builders, have their history," according to CARLYLE, and it would be pleasant, before granting a final certificate, to be able to discover the events for which an ordinary house would become the theatre. Scottish palaces and castles were especially adapted for vaticinatory purposes. The Argyle Lodging in Stirling is an instance.

From whatever point of view it is seen, Stirling appears to be picturesque, and the town itself does not

disappoint the visitor when he passes along the streets. "The Bulwark of the North" still possesses many of the old dwellings which are evidence of what was once a capital. Some are turned to uses which the builders could not have foreseen. The military hospital was once the residence of the Earl of ARGYLE, and it has been described as "the finest specimen of a nobleman's lodging or town-house in Scotland." In an architectural sense, it has greater claim to be considered as the house of the Earl of STIRLING, but the influence of the ARGYLE family has prevailed.

In 1571 there is reference to the presence of the fifth Earl of ARGYLE in Stirling, and in 1617 land "forment" the seventh Earl's house is mentioned in the records. The latter was a boy of eight when he succeeded to the title, and for his safety he was sent abroad. On his return he married a Catholic lady, and eventually he was declared a traitor and rebel. His son and successor was a prominent man in the troubles of the Civil War and was executed for high treason in 1661. *WARD's Last Sleep of Argyle* was one of the paintings commissioned for the decoration of the Houses of Parliament and is known by the large engraving. CHARLES II made some amends to the ninth earl, who as soon as he came into possession of the estates erected a new mansion in Stirling, in which was incorporated a part of the older building.

A tutor and travelling companion of the seventh earl was WILLIAM ALEXANDER of Menstrie. According to the book before us he was born about 1567, but in most accounts of him the date is put down as 1580. He was one of Scotland's early poets, and is honourably mentioned by HALLAM as well as CAMPBELL. His "Domesday" runs through twelve books. As a scholar he secured the favour of JAMES I. of England, and from the king he obtained not only titles and high offices but a grant of the greater part of North America. He considered it was obligatory on him as Earl of STIRLING to possess a fine mansion in the burgh, and he selected a site adjoining the Argyle Lodging. The architect was his son, ANTHONY ALEXANDER, the Royal master of works. Mr. RONALD says of it:—"It is a large building three storeys in height, measuring about 100 feet on the wall facing the east, 88 feet on the north, 81 feet on the south, and 96 feet of frontage to the Wynd. . . . The internal arrangements of this mansion were in advance of the time in which it was built. The retainers' hall, 47 feet long by about 20 feet wide, is now divided by a slim partition, and partly used as kitchen." There was a public room 20 feet by 20 feet and the state-room measured 47 feet by 20 feet.

The house was completed in three years, and in 1635 the Earl took up his abode in it. He died in Covent Garden, London, five years afterwards, leaving his estate embarrassed. His son, the architect, also died in London in 1637. The mansion fell to the fifth son, who lived until 1664. Soon afterwards the Town Council, having a mortgage on it, took possession of the building and arranged to use it as a hospital. Before it was adapted for that purpose the Earl of ARGYLE was able to obtain it by paying one thousand pounds. He altered the walls in order to make one building of the two residences. A Council of War was held in it in 1715, and the Duke of CUMBERLAND occupied it for a few nights in 1745. It was described as a ruined house in 1760, and in 1764 it was sold. The property subsequently changed owners several times until the beginning of the nineteenth century, when the Crown purchased it, and it now serves as a military hospital.

Mr. RONALD, the author of the monograph, was a builder who was born in Stirling in 1838. The technical accuracy of his descriptions is therefore explained. He was prominent as a townsman and held various municipal offices. Mr. RONALD was also an enthusiastic archaeologist, especially in connection with Stirling, and he was fortunate in having several discoveries to his credit. He was unable to complete his history of Stirling Castle, which would have been his principal work.

* *The Story of the Argyle Lodging.* By James Ronald. (Stirling: E. Mackay.)

"The Story of the Argyle Lodging" has been produced on a style which is creditable to printer and publisher. Mr. D. B. MORRIS's memoir of the author is an affectionate tribute to the memory of his friend. The building is illustrated by photographs and other illustrations which reveal the character of a remarkable house, one that suggests the architectural and constructive skill to be found in Scotland at the beginning of the seventeenth century.

CROSBY HALL.

THE local government, records and museums committee of the London County Council have prepared the following report:—The Council is probably aware that Crosby Hall, Bishopsgate, is in imminent danger of demolition. Having regard to the historical associations of the hall (which are alluded to below) and its unique architectural interest, we have had before us the question whether the Council should take any action in the matter, as it is empowered to do by section 60 of the London County Council (General Powers) Act, 1898, which provides that "It shall be lawful for the Council, if they think fit, to purchase by agreement buildings and places of historical interest . . . or to undertake or contribute towards the cost of preserving, maintaining and managing any such buildings and places. . . ."

The first reference to the site is made in 1466, when John Crosby, an eminent grocer and woolstapler, obtained of the prioress of the convent of St. Helen a lease for ninety-nine years of certain lands and tenements adjoining south-west of the priory precinct. Included in the lease was a house wherein he then resided, and which is described as "all that great tenement with the appurtenances formerly in the possession of Catanei Pinelli, merchant of Genoa" (Blackburn's "History of Crosby Place," pp. 1, 2). In place of this Stow says that Crosby erected a new house "of stone and timber, very large and beautiful, and the highest at that time in London." There can be little doubt that, at any rate, the existing great hall was built at that time. Crosby died in 1475, and in 1483 Richard, Duke of Gloucester, who shortly afterwards became king under the title of Richard III., was in possession, probably as a tenant under Crosby's executors. Richard arrived in London on May 4, 1483, and, getting possession of the king (Edward V.) and his brother, he took up his residence at "Crosbie's Place" (Hall's "Chronicle"). Shakespeare, in his play "Richard III.," several times alludes to Richard's stay there. In 1501 Sir Bartholomew Reed was the tenant of Crosby Place, where in the following year he spent his mayoralty, one of the most brilliant on record. It is said, moreover, that it was at Crosby Place that he entertained the Princess Katherine of Aragon two days before her marriage with Prince Arthur, and subsequently received the ambassadors of the Emperor Maximilian when they came on a visit of condolence on the occasion of that Prince's death (Hugo in "Transactions of London and Middlesex Archæological Society," vol. i. p. 44). Subsequently the lease passed, by purchase, to Sir Thomas More, afterwards Lord Chancellor, and some have supposed that it was here that More composed the "Utopia" and "Richard III." In 1523 he sold all his remaining term or interest in the lease of the "great tenement called Crosbie's Place" to his friend Antonio Bonvici. During the residence of Bonvici the freehold, by the dissolution of the priory, passed to the Crown, and was purchased by Bonvici, who held it until 1553. In 1566 the house was purchased by William Bond, alderman, who is said to have made considerable additions to it, and from his family it passed in 1594 to Sir John Spencer who, in that year, held his mayoralty there. During this period it seems to have been the custom to lodge ambassadors at Crosby Place. The Dowager Countess of Pembroke, "Sidney's sister, Pembroke's mother," was living there at some time between 1609 and 1615, and it may with probability be conjectured that Shakespeare, himself a resident in the parish of St. Helen's, was often a guest at Crosby Place during her tenancy. Crosby Place escaped the Great Fire of 1666, but about 1676 nearly the whole of the building, apart from the great hall, was burnt down. The hall was in 1672 converted into a Nonconformist meeting-house, and was so used until 1769. Part of it was during some portion of the period utilised as a grocer's warehouse. From 1810 to 1831 it was let for a packer's warehouse. On the lease running out in the latter year the building was in danger of demolition. Public interest was aroused, however, and subscriptions were invited "for

the purpose of securing an interest in the hall on a term of lease equal in point of possession to a freehold and for restoring its architectural details to their primitive splendour" (*Gentleman's Magazine*, 1832, Part I. pp. 505-8). The freeholder granted the restoration committee a lease for ninety-nine years. The first stone of the exterior restoration of the building was laid by the Lord Mayor on June 27, 1836, and the hall was reopened on July 27, 1842. From that year it was leased to the Crosby Hall Literary Institute, and on the institute coming to an end in 1860 the freeholder repurchased the lease. For the next seven years the hall was used as a wine merchant's warehouse, for which purpose damaging alterations were carried out. In 1868 it was restored, and has since been used as a restaurant.

We are giving the matter careful consideration, and propose to take an early opportunity of viewing the premises.

TRAINING IN ARCHITECTURE.

ON Saturday the Rede Lecture was delivered in the Senate House at Cambridge by Sir Aston Webb, R.A., whose subject was "The Art of Architecture and the Training Required to Practise it." It was apropos of a proposal to establish a University diploma in architecture.

The lecturer said it would probably be admitted that theoretically architecture was the noblest of all arts and the foundation from which the sister arts of sculpture and painting should derive their growth; but in practice the educated public of the present day were, it could hardly be denied, more interested in the progress and development of the sister arts than they were in architecture. This was to be regretted, for this art, like the others, required the stimulus of sympathetic encouragement in order to attract the best men to its ranks and procure results of the highest order. He was glad to take that opportunity of gratefully acknowledging, on behalf of himself and colleagues, the interest that the University of Cambridge was taking in the academic training of architects. The neglect of architecture was perhaps the more remarkable because, owing to its utilitarian side, it affected for good or ill the health and comfort of everyone; whilst it was perhaps the utilitarian side that had led the public to regard it as hardly an art at all, and to refuse to believe that a man could be an artist who was expected to be thoroughly conversant with foundations, drainage, heating, ventilation and accounts. The art of architecture in its highest sense must, like all art, produce on the beholder certain emotions and feelings. Thus our public buildings should stir our pride and love of country, and our palaces a sense of the majesty and power of the rulers. The buildings of our law courts and prisons should inspire awe and obedience; our university and educational buildings should suggest dignity, learning and restraint; our houses the happy privacy of home, and so on. That had been the mystery of the buildings of Egypt, Greece and Rome. Again, to be wholly satisfying, architecture must also be the indigenous expression of the people. There was a present desire to discard archæological methods and start again with simple forms, thus following the example of painting and sculpture. Italian architects from the fourteenth to the sixteenth centuries were largely painters, sculptors and poets, as well as architects. Inigo Jones and Wren in England introduced the Italian influence. A more elaborate system of training was required now than formerly, owing to the fact that our traditions had been lost, and that buildings, both in their construction and arrangement, were more complicated than formerly. The present means of meeting these requirements were the Royal Academy Schools, the inducements to study held out by the Royal Institute of British Architects, lectures and classes at the University of London, King's and University Colleges, the London County Council, the Polytechnics, the excellent architectural schools in many of the provincial cities and towns, and the school and classes of the Architectural Association. In France the State, the Academy and the architects had combined to produce one great scheme in connection with the *Ecole des Beaux-Arts*, in which painters, sculptors and architects all worked together, with the *Prix de Rome* as their final goal. The modern training of an architect in England had been carried out by members of the profession themselves at their own expense and in somewhat isolated and spasmodic methods. He claimed that before technical training was begun a good education should be acquired; if possible five years should be spent at a good public school and three years at a

university. It seemed to him of the greatest moment that there should be a conference or other method to determine the part which each of the educational bodies concerned was to play in the training of an architect, and he believed the universities could do much to help them. The cause was a great one, for architecture was surely, with literature, the most permanent record of a nation's life, the one by which the civilisation and culture of our time would be most surely judged of hereafter.

ARCHÆOLOGY IN STAFFORDSHIRE.

AN excursion of the North Staffordshire Field Club to Chebsey, Eccleshall, Gnosall, Ranton and Ellenhall was lately arranged and successfully carried out under the able leadership of Mr. A. Scrivener, of Hanley. At Chebsey Mr. Scrivener drew attention, says the *Staffordshire Advertiser*, to the remains of the early shaft to the churchyard cross, cylindrical at the base, with band at the point where it becomes rectangular. This cross is very similar to the Leek and Clewlow crosses. Mr. Scrivener also described the church, with its Norman and Early English masonry, and remarked that Chebsey was one of the few churches in the county with an outside stair turret running right up to the top of its Perpendicular tower. There are four bells, three of which are of the pre-Reformation period. An inscription over the church porch bears the date 1715, and a coat of arms in the tower is dated 1710. The interior of the edifice was inspected with more interest from the fact that all the old plaster has been removed from the walls. Among the features of interest in the church are the Norman window on the north side of the chancel, indications of early window on south wall of chancel inside, and the arcade and chancel arch, which are of Early English character. Outside, on the east wall of the tower, may be seen the line which the old high-pitched roof followed.

The vicar (the Rev. C. M. S. Patterson) read a list of the parsons and vicars of Chebsey, which the Rev. F. Parker, of Colton, had supplied to him. The first entry in Domesday Book relating to Chebsey was 1086, but no name was given. The next earliest was 1194, when Hugh Pippart was parson, and the last entry (1573 to 1590) contained the name of Humphrey Whitmore, who succeeded to the benefice on the death of his predecessor, Sampson Marvall. Mr. Patterson mentioned the curious fact that up to the year 1220 the priory of St. Oswald's, York, claimed rights in Chebsey and other churches in the diocese of Canterbury. In 1326, according to the Sacrist's roll in Lichfield Cathedral, a cope or baldachin, embroidered with birds, was delivered at Chebsey Church by the Chapter, and in 1345 a similar gift was again made. By an entry in the Chapter Acts book, 1523-4, the chancel of Chebsey Church was ordered to be put into "competent repair."

A short drive brought the party to Eccleshall, where the fine old church, memorable as the hiding-place of Queen Margaret after the battle of Blore Heath, claimed first attention. On the occasion of the Club's former visit to the church in 1896 Mr. Charles Lynam dealt exhaustively with its architectural features, and Mr. Scrivener, who now acted as guide, consequently refrained from entering into all the details. He pointed out that the earliest remains to be seen in the church consisted of two slabs of stone, doubtless fragments of a cross shaft, built into the north walling of the north aisle to the tower, and alluded to an interesting discovery he had recently made of a fragment of stone, most probably part of the same shaft, built in the walling of the south arcade near the chancel arch. Had they here, he asked, the remains of St. Chad's time? At any rate, they were most probably pre-Norman remains. Next in point of date came the stone forming the bottom step of the inside doorway of the stair turret at the south-west angle of the tower. This was probably part of a Norman abacus or the top of a Norman arch-pier. Of the present structure, the north and south arcades formed the earliest portion and were probably erected about 1190. He drew attention to the old roof line on the tower wall, and said he did not think there ever was a clerestory at that time. Mr. Scrivener also alluded to the chancel, which was of the Lancet period, the north chapel and the vestry, observing that it was not easy to account for a small opening in the west wall. Was there ever a floor over the vestry or was that building an anchorite's abode and this a small window to look into the chapel? The tower, with its three beautiful arches opening respectively into the church and the north and south aisles, were also the

subject of interesting comment by Mr. Scrivener. The south doorway to the church and portions of the outer doorway to the porch were, he said, excellent examples of the Perpendicular period, but the porch itself had been much restored. It had been stated that the south aisle was of this period, but he was inclined to think its windows were post-Reformation. As an explanation of what had been described as a puzzle, Mr. Scrivener mentioned that the middle stage of the tower had on its north, south and west faces openings which had been identical and were windows no doubt like the south one, but altered at later times. The monuments in the church to four bishops of Lichfield were inspected with much interest. Bishop Overton's monument is dated 1603, but he died in 1609, and Harwood states that he put up this monument during his lifetime. Bishop Overton was rector of Stoke-on-Trent in his earlier life. It is a curious coincidence that the date on this monument is the same as on Erdeswick's in Sandon Church, and it is of the same character in many respects. There are some quaint headstones in Eccleshall churchyard, one being an inscription on the western face to the nephew of the one whose name is on the eastern face, the lines rhyming with capital letters. Another headstone denotes the resting-place of James Bayley, late of Park House, who died at the advanced age of 99. The inscription records the fact that "he was servant to five bishops at Eccleshall for 55 years 9 months and 17 days, keeper and woodman, and fished Copmere Pool 45 years." A lady member of the party drew attention to several curious grooves in the exterior wall of the church, which are supposed to have been caused by the sharpening of arrows, and Mr. Scrivener said a royal order was promulgated in ancient days enjoining the use of the bow by yeomen on "Sunday afternoon in the churchyard on the south side." Mr. Lynam said he noticed a few yards to the west of the tower a beautiful monumental effigy, which he thought might very well be taken inside the church, and he hoped the Club would bring its influence to bear upon the matter.

At the castle the members were cordially welcomed by Mr. and Mrs. Carter. Mr. Scrivener gave a brief history of the castle, of which he said sufficient remains existed to show that it consisted of a square enclosure bounded by a large moat. There was probably a tower at each angle, but only one remained. Mr. Scrivener added that an old history in his possession stated that Walter de Langton pulled down the castle and manor-house at Haywood and built them both anew. At the house, Mr. and Mrs. Carter exhibited several interesting "finds" in the grounds, including an ancient stoup, bearing the Staffordshire knot, and probably used for holy water or as a christening font; also a good-sized cannon ball, supposed to have been fired at the castle—"one of Cromwell's little politenesses," as a member of the party humorously observed. An inspection of the curious nine-sided tower followed.

Mr. C. Lynam kindly undertook to describe the interesting cruciform church of Gnosall, the restoration of which he superintended. Starting at the west end, which has great peculiarities, he said that prior to the restoration there were staircases to the north and south aisles leading to galleries, which went right through the church. These galleries were used not by the ordinary congregation, but by the poor people, the men being on one side and the women on the other. In the west front was a central doorway, over which were three lancets combined; there was also a lancet to each aisle. The original church had a high-pitched roof and narrow lean-to aisles. The battlemented portion of the tower was added when the clerestory walls were built. He pointed out that the chancel was of considerable size, as was usual in collegiate churches; it had been very much restored, and the upper part was of a much later date than the lower. Speaking inside the church, Mr. Lynam said that, looked at from east to west, the structure could not fail to command admiration. He pointed out the beautiful carving on the chancel arch, which had formerly been hidden by plaster, and also what appeared to be part of a narrow arch in the wall near to the pulpit. He was not able to say exactly what it was, but that it belonged to the original work there could be no question, as it was precisely the same in character. It might have been a narrow arch leading to the larger arches of the nave, or it might have been an arcade. The noble proportions of the chancel were indicated, and Mr. Lynam mentioned that Gnosall had the good fortune to succeed to the fine reredos which Mr. Street erected at Eccleshall when he restored the church, and which had been replaced by a more elaborate one. The

only ancient monument was a tomb with effigy erected to a member of the Brough family. Mr. Lynam's observations were listened to with the greatest attention, and he concluded by observing that in Gnosall they had one of the most interesting churches in the county.

Continuing their journey, the party arrived at Ranton, where by the kindness of Mr. Williams the remains of the ancient priory were inspected.

Mr. Scrivener, quoting from an unpublished history of "The Priory and Manor of Ranton," written by Mr. J. W. Bradley, of the William Salt Library at Stafford, stated that the priory was founded by Robert, called Fitz Noel, Lord of Ellenhall, temp. Henry II. The site was a space that had been secured in the woodlands of Ellenhall, and the house was dedicated to the Blessed Virgin Mary. These circumstances gave it the name of St. Mary of the Clearings or Ridings. Eyton and Wrottesley stated that all that could positively be said of the date of foundation was that it was prior to 1166. In a list of priors of Ranton from 1166 to 1535, Thomas d'Alton was the last. The revenues of the priory were valued at 90*l.* 2*s.* 10½*d.* per annum. Ranton was known as a priory of Black Canons subordinate to the Abbey of Haughmond, in Shropshire, built and endowed in the time of Henry II. by Robert fil Noëli. According to Pitt, the remains of the abbey in 1817 were a high tower, part of the walls and a small part of the cloisters, but at the present day there only remains the very interesting Perpendicular tower. Mr. Scrivener pointed out some very early work on the southern side of the tower, and also fragments of exquisite carved work.

Mr. Lynam advanced the theory that the upper part of the tower was used as a pigeon-house when the priory was a monastic institution. The existence of a doorway on the inside of the stair turret had always puzzled him, but seeing the doorway outside, the sides of which were now filled up, induced him to believe that it led to the columbarium.

The Rev. G. T. Royds said the priory was originally a moated site, there being traces of a moat on the north side.

From Ranton the party, which included motorists as well as cyclists, proceeded to Ellenhall, where some routine business was transacted, and Mr. W. Wells Bladen (secretary) sketched the programme for the long excursion of the club to Cheltenham and district next month under the leadership of Mr. Lynam and Dr. McAlldowie. Subsequently the members visited the parish church, which was restored in 1886 under the direction of Mr. C. Lynam during the incumbency of the late Rev. H. Turnour. Two mural tablets on the south wall of the church first claimed attention, one being inscribed in plain lettering "JONATHAN COPE," and the other "ANNA COPE, 1683. T. H. FREEMASON."

The Vicar narrated a curious legend with reference to the word "Freemason," but no one seemed able to interpret the initials "T. H." Just in front of the church porch is an ancient churchyard cross restored by Mr. Lynam in 1886, and the objects of interest in the interior of the edifice include a Norman "tub" font, which was recovered from a neighbouring farmhouse, where it was used as a pig trough; fourteenth-century tiling at the entrance of the chancel, fifteenth-century tracery and small Norman window in the north wall of the chancel. From the church the party proceeded to the Old Hall, which was inspected by the kind permission of the occupier, Mr. Joseph Kent. This was formerly the manor-house, the home of the Noel and Harcourt families, who also owned Hilcote and Chebsey. An interesting feature of the hall is the fine oak staircase, said to be 200 years old. The Vicar read a few interesting notes of the history of Ellenhall or Linehalle, as it is described in Domesday Book, after which the party adjourned to the Vicarage, where an ancient quern turned up by the plough in one of Mr. Kent's fields and a stone hammer-head found in Frankwell Orchard, the site of an old Norman settlement, were inspected.

THE BRITISH SCHOOL OF ROME.

THE Rome correspondent of the *Morning Post*, reviewing the work of the institution since the beginning of October, says the season has been memorable in several ways. For the first time the school has had the advantage of the Government grant for a complete season, and this financial aid, though it has by no means placed it in the favoured economic position of some of the similar institutions belonging to other nationalities, has yet proved of great benefit. For the first time, too, the school's official work has begun, and the director has been in residence, on October 1—an arrangement which enables students of the

Athens school to pass a brief period in study in Rome on their way out. Unfortunately a season otherwise satisfactory has been marked by the death of Professor Pelham, of Oxford, the founder of the school, to whose constant interest in its welfare it owes so much and whose place as chairman of the managing committee has not yet been filled.

The year has been the first of Dr. Thomas Ashby's directorship. Dr. Ashby has been associated with the school since its foundation; he was for two years assistant director, and during the interregnum of twelve months which followed the retirement of Mr. Stuart Jones he was practically at the head of the school; before the beginning of this season he was formally appointed as its director. Of Dr. Ashby's capabilities for the post it is needless to speak. He is regarded by foreign as well as by British archaeologists as the highest living authority—*le Nibby de nos jours*—on the classical topography of the Roman Campagna, to which he has for several years devoted his special attention. During the season the school has had some thirteen students on its books. Mr. A. H. S. Yeames, late of the British Museum, has been preparing himself by a study of the history of the fifth and following centuries of our era for the archaeology of the early Middle Ages. Mr. C. E. Stuart has been examining manuscripts of Juvenal and of Seneca's tragedies. Miss Ericksen has continued her studies of Italian gardens and villas. Mr. P. W. Droop, before proceeding to take part in the excavations at Sparta, spent some time investigating the Messapian inscriptions near Lecce, and incidentally endeavoured to find the tomb of the last French Duke of Athens there. Mr. F. G. Newton, an architect, has been working at the Columbarium of Pomponius Hylas near the now closed Porta Latina, and has drawn plans of that famous road. Mr. H. Morley, a gold medallist of the Academy, has copied the frescoes in the Stanze of the Vatican and the ceiling of the Sistine Chapel, besides studying Paolo Veronese at Venice. Two other architects, Messrs. S. H. Maw and J. H. Higson, have measured various classical fragments, such as the entablatures in Trajan's Forum, as well as several Baroque churches, such as the Gesù. Mr. Allan Mainds has devoted his time to the pictures and frescoes in the Vatican and at Florence; Miss Welsh has been studying sculpture; Mr. T. E. Peet, an Oxford Craven Fellow, proposes to take up prehistoric investigations in Southern Italy. Two other students, Mr. A. G. Henderson and Miss Abrahams, were here for a short period. In addition to the students eight associates of the school have been at work in connection with it:—Mr. G. S. Davies, of Charterhouse, the author of "Hans Holbein;" Mr. Oppé, of the Education Department; Messrs. M. S. Briggs and R. W. Thorpe, two architects who have been studying Baroque buildings at Lecce; Mr. G. A. N. Reid, of South Kensington, who has been engaged in Northern Italy; Mr. V. Hill, also of South Kensington, who has sketched sculpture and decoration in Rome; Mr. G. R. Woolway, who has worked in the Piccolomini Library at Siena; and Mrs. Tilt, an artist.

There have been two open lectures at the school during the course of the winter, at which the director, the assistant director and Mr. J. A. Twemlow, of the Record Office, read papers on the Campagna, on Sardinia, on the Capitoline Catalogue and on St. John of Bridlington. It is proposed before next season to make a small structural alteration at the school, so as to provide more accommodation at the lectures. The library has greatly increased of late, thanks largely to numerous donations of books, such as the publications of various British Archaeological Societies and the "Archæological Survey of India." A number of books on sculpture have also been purchased, and the library, considering its short existence, is now fairly voluminous. But both time and money are required to form a really large archæological and historical library.

The British School is the only British scientific institution in Rome. Our Teutonic cousins have the Prussian Historical Institute as well as the German Archaeological School; they have ample official backing; more useful still—their students are all certain of posts when they return to the Fatherland. In England it is not so; learning as a rule *laudatur et alget*. All the more reason is there, then, for supporting a foundation which not only advances scholarship but also increases British prestige.

A Hoarding has been erected around the equestrian statue of Bartolommeo Colleoni in Venice. The foundations have settled and it is necessary to undertake restoration which is likely to occupy a couple of years.

NOTES AND COMMENTS.

THE payment of 30,000*l.* for 36 acres of land, a mansion which was estimated to bring in 400*l.* rent, fees for admission to see the ruins, or in all 625*l.* a year, must be considered from the surveyor's point of view as a liberal price. In our time, when land is not over-priced, forty-eight years' purchase on a rack rental is unusual. But then there is the fascination of tradition. At Glastonbury legendary fascination out-balanced the principle of profit, and to keep the fragments of the old abbey from adorning a public park or the private grounds of a millionaire in the United States caused the biddings to run up to the sum mentioned. The purchaser was Mr. ERNEST JARDINE, of Nottingham. But he has assigned his interest to the Bishop of BATH AND WELLS, who thus becomes responsible not only for 30,000*l.*, but for the expenses of the sale, interest, &c. His Lordship has been guaranteed to the extent of 15,000*l.*, and he appeals to the public for the remainder of the sum. The abbey property when acquired would be vested in the Archbishop of CANTERBURY, the Bishops of WINCHESTER, BRISTOL, GLOUCESTER AND BATH AND WELLS, together with other persons, presumably laymen, who would be suitable to hold it as administrative trustees on behalf of the Church of England. How the property is to be utilised does not appear to be as yet determined.

THE difference between the systems of contracting for builders' work in London and Glasgow was exemplified at the last meeting of the Building Trades Exchange of Glasgow. When that institution was founded it was imagined there were sufficient builders in Glasgow to support the outlay. But in the north general contractors are rarely recognised, and, as in France, nearly every trade is represented by a contractor. The Council have the sense to accept the peculiarities of the building business, and it has been resolved to enlarge the basis of the Exchange. It is therefore proposed that the Executive Council, in addition to twenty-one members of the Exchange who are shareholders, shall consist of two representatives of the Institute of Architects, the Institute of Measurers, and of the following trade associations, viz. Master Masons, Master Bricklayers, Master Wrights, Master Slaters, Master Plumbers, Master Plasterers, Master Lathsplitters, Master Glaziers and Master Painters. If any other associations are formed they will also be invited to share in the business. It is believed that by that course the building trade in general will be gainers, for an approach would be made towards the creation of a powerful united body.

FOR the first time the prize founded by the late M. HENNER, the Alsatian painter, was awarded on Friday last. The value of it is 3,000 francs, but as the same artist can enjoy it for two or three successive years it has some importance. The prize is not intended for students; there are several already for them. M. HENNER wished to aid figure-painters who, like himself at one time, having gone through the student stage and won rewards, found it difficult to undertake an important work and were tempted to produce pot-boilers, in consequence they were likely to fall into the clutches of dealers. It is therefore stipulated that candidates for the HENNER prize must have passed their thirtieth year. The jury is to consist of members of the Academy of Fine Arts and winners of the Médaille d'honneur of the Salon. The distinction of gaining the first prize belongs to M. GUINIER, a pupil of BENJAMIN-CONSTANT and of M. JULES LEFEBVRE.

MANY of the stories which are related about the action of sand in Egyptian and Arabian deserts are

thought to be imaginative. But the people of Conway are likely to be convinced that sand power can become terrifically destructive. They have had experience of its effects on a small scale. Adjoining the town is a plain known as the Morfa, which was used as a camping ground. Last year seven battalions came there; this year it is considered that only two could use the site. The sand not merely covers the grass, but overcomes the temporary buildings. The Council have obtained advice from the French maritime department, and propose to use 4,000 trees of the *Pinus maritima* species, which helped to catch the sand at Arcachon. Earth and gravel will have to be brought from a neighbouring mountain before the shrubs are planted. Fences or groynes of brushwood were found to be insufficient, and apparently systematic planting is the only remedy. The Council propose to borrow 2,510*l.* to carry out the work, and in order to have authority an inquiry was held by a Local Government Board inspector. From the evidence given by Mr. DELAMOTTE, the borough engineer, we have taken the facts which are given above. It will be a novel experiment, and the result will be observed with attention, especially as the danger is not unconnected with erosion.

A CONFERENCE of the Royal Sanitary Institute is to be held in Trinity College, Dublin, from June 25 to June 29. The Earl of Ross, who is president, will deliver the inaugural address in the examination hall of the college. The work of the conference will be divided into three sections:—1. Sanitary Science and Preventive Medicine; 2. Engineering and Architecture; 3. Physics, Chemistry, Biology and Meteorology. The first section will have Sir C. A. CAMERON as president. The subjects for discussion will be "Poor Law and Sanitary Administration in Ireland" and "The Role of Sanatoria as a Factor in checking Tuberculosis." The president of the section of Engineering and Architecture will be Mr. P. C. COWAN, C.E., of the Irish Local Government Board, and the vice-presidents will be Mr. ROBERT COCHRANE, Sir THOMAS DREW, Mr. WILLIAM M. MITCHELL, Mr. G. CHATTERTON, and Mr. W. ROSS. The subjects for discussion will be "The Economic Housing of the Working Classes in Town and Country," and "Could the Existing Statutory and Departmental Requirements as to Sewage Disposal be relaxed in Certain Cases with advantage to the Community?" Sir J. W. MOORE, M.D., is president of the third section, in which will be discussed "The Climatology of Ireland in Relation to Public Health" and "Disinfection Considered from a Medical, Chemical and Bacteriological Standpoint." Excursions have been arranged, and English and Irish railway companies are issuing return tickets at a single fare and a quarter.

ILLUSTRATIONS.

HOUSE IN BUCKINGHAMSHIRE—GARDEN FRONT.

THESE illustrations show the entrance and garden fronts of a house that was proposed to be built near Wendover, Bucks. The walls outside would have been covered with rough-cast, the dressings being of Bath stone, and the roofs would have been covered with red "Italian" tiles. The woodwork throughout would have been painted white. The gardens were designed by Mr. SALVANDE and the house by Mr. R. A. BRIGGS, F.R.I.B.A., of 12 Norfolk Street, Strand, W.C.

HOUSES, CLEVELAND ROW, S.W.

CATHEDRAL SERIES.—CARLISLE: VIEW OF CHOIR, LOOKING WEST.

THE LATE J. A. CHATWIN.

THE record with very great regret, says the *Birmingham Daily Post*, the death of Mr. J. A. Chatwin, the well-known architect, which occurred on the 6th inst. at residence in Wellington Road, Edgbaston. Mr. Chatwin, recently completed his seventy-seventh year, had been sick up for some time, but he had no specific illness, though he had retired from the more arduous work of his profession, he was able to attend to business affairs in two days of his death.

Mr. Chatwin was a Birmingham man and an Old Ed-dian. His father, Mr. John Chatwin, was a well-remembered button manufacturer in Great Charles Street, and the subject of this memoir was born in April 1830. At King Edward's School he was contemporary with a number of scholars whose subsequent reputation gave distinction to the school. Mr. Chatwin matriculated at London University, but did not proceed to a degree. At an early age he commenced his architectural education in the office of Messrs. Branson & Gwyther, building contractors, who were at that time engaged upon the extension of the London and North-Western Railway from Curzon Street to New Street. This position enabled him to gain valuable knowledge of the principles of construction. Mr. Gwyther showed special interest in his young assistant, and encouraged him in attempts at architectural design. As he showed a distinct gift in this direction, he was in 1851 sent to Sir Charles Barry, from whose designs the Houses of Parliament and other important buildings were then being erected. It was doubtless from this association that Mr. Chatwin imbibed an admiration for features of the Perpendicular style of architecture which are to be embodied in much of his ecclesiastical work and designs for school buildings. Mr. Chatwin assisted in making the drawings for the House of Lords. During the period of his articles he assiduously attended the evening classes of the first schools of design originated by Prince Albert and held at the old Royal Academy rooms, Somerset House, under the direction of several artists of distinction.

On leaving Sir Charles Barry, Mr. Chatwin commenced practice in Birmingham, and quickly established a high reputation, particularly for ecclesiastical work. An ardent student of archaeology and a lover of the old Warwickshire churches, he infused into his designs a dignity and feeling of repose which gave confidence to those interested in ancient fanes, that if he was called upon to undertake a restoration or an enlargement the result would not be an artistic incongruity, but something characterised by dignity, breadth of treatment and harmony of form. It was a tribute to his capacity and taste that he was selected to design the new church of St. Martin's, an example of his work in the Perpendicular style which has been justly admired. In connection with the taking down of the previously existing building he unearthed traces of a structure going back to a much more remote period than had previously been imagined. The details of the discoveries were set forth in the late Mr. J. T. Bunce's "History of Old St. Martin's." An even finer achievement than St. Martin's was Mr. Chatwin's restoration and enlargement of Aston Church. The first part of the work was carried out in so admirable a manner that the late Mr. John Feeney said: "Mr. Chatwin practically *carte blanche* in the matter of completing it by the erection of a costly chancel, which was undertaken as a family memorial. Another notable work was the provision of a chancel to St. Philip's in place of what was merely a recess for the communion table. The chancel was designed in Classical style, with bold rounded pilasters and outstanding Corinthian columns and cornice, which gave to the interior of the church an aspect of dignity and impressiveness and pleasing. Mr. Chatwin was responsible for the commission being given to the late Sir Edward Jones for the designs of the beautiful series of windows afterwards added to the church. He was, of course, retained as architect in connection with the modifications of the interior arrangements required a few years ago to adapt St. Philip's as the cathedral church.

Other works which may be mentioned were the enlargement of St. George's, Edgbaston, the restorations, involving considerable rebuilding and enlargement, of Edgbaston old church and Handsworth parish church. Mr. Chatwin also restored St. Augustine's, Edgbaston, the Catholic Apostolic church, Spring Hill, St. Ambrose, Christ Church, Edgbaston, St. Mary's, Bearwood, All Saints, Stechford, St. Mark's, Washwood Heath, St. Mary's, Acock's Green, St. Philip's, Knowle, St. Mary's, Warwick, St. Mary's, Kidderminster, Penkridge parish church, Mapleborough Green

Church, near Redditch, Greasley Church, near Nottingham, and many others. Mr. Chatwin's work was not confined to the ecclesiastical domain, but he prepared drawings for numerous public and private buildings. The Great Western Hotel, in Colmore Row, was an early example; the head offices of Lloyds Bank belong to a later period, as also the same company's bank in Lombard Street, London, and branches in a number of provincial towns. The Wolverhampton Art Gallery was his design. He was as skilful in his drawings for terra-cotta work as for stone, as witness the Hen and Chickens Hotel, New Street, the various branch grammar schools, and the High School for Girls, which he designed as architect to the governors of King Edward's Foundation.

People who are acquainted with examples such as those enumerated will recognise that Mr. Chatwin had a large measure of the artistic temperament. He was a lover of pictures, and for many years was vice-president of the Birmingham Royal Society of Artists. He also took an active interest in the work of the archaeological section of the Midland Institute. Many years ago he was elected a Fellow of the Royal Institute of British Architects, and he was also a Fellow of the Antiquarian Society of Scotland. Mr. Chatwin married in 1869 the second daughter of Mr. Edward Boughton, of Coventry, and leaves four sons and four daughters. About ten years ago he took into partnership his son, Mr. Philip B. Chatwin, who relieved him of the greater portion of his professional work. Mr. Chatwin was a Conservative in politics, but took no part in public matters outside those related to his profession. He was characterised by personal qualities which made him as deservedly respected as he was widely known.

LUSTRE POTTERY.*

IT would be unbecoming in me to commence a paper on "Lustre Pottery" before the Applied Art Section of the Society of Arts without recalling that it was from this platform, some fourteen or fifteen years ago, that Mr. Wm. de Morgan, our English pioneer in the methods of true lustre decoration, first explained his processes and their results. My reason for reading a fresh paper now on the same subject is that during the last fifteen years a great deal has been learnt about the history of the various lustre processes, and great advances have been made by Hungarian, French and English potters in extending and perfecting the various methods of lustre decoration. While gladly acknowledging what the English pottery trade owes to Mr. De Morgan in the way of incentive and experiment, I trust it may be found, when my paper is concluded, that English potters are now prepared to repay the debt by fresh and original work of their own.

In considering the subject of lustre pottery it is necessary to spend some time in a careful consideration of what we mean by the term, for it has been applied indifferently to methods that are old and new, to decorative results that are exceedingly delicate and subtle, as well as to those that are the reverse. On the table before us is assembled nearly every variety of pottery that the most catholic of collectors could bring together under this designation. Here will be found the so-called "copper" and "silver" lustred earthenwares of Staffordshire, Swansea, Leeds and Sunderland, first produced during the latter part of the eighteenth century, so largely manufactured during the first half of the nineteenth century, and now become the spoil of those collectors who despair of attaining to the finest things. Here, too, are the oldest lustres of all, dating back for more than a thousand years, when Egyptian, Syrian or Persian potters discovered a unique method of pottery decoration which was carried round all the countries bordering on the Mediterranean, with its apogee in the Hispano-Moresque wares of the fifteenth century and the Italian majolica of the sixteenth century. Here, too, are examples of the modern pieces made in imitation of, or in rivalry with, these Mediæval masterpieces; by Ginori and Caviglioli of Florence; by the Massiers in Cannes; by the Spanish potters of Seville and Manises; by Zsolnay of Pécs in Hungary; by Hermann Kähler in Denmark, and by De Morgan, Pilkington's, Bernard Moore, Maw's and others in England. Here also will be found the faint, nacreous, bismuth lustres invented by Brianchon of Paris in 1856, but best known among us from their use on the once-famous Belleek porcelain of Ireland.

* From a paper by Mr. William Burton, F.C.S., read before the Applied Art Section of the Society of Arts.

What pictures the imagination conjures up under the stimulus of such a string of names. To glance from Old Cairo and Rhages or the Moorish kingdom of Granada, Diruta in its prime and the Gubbio of Maestro Giorgio, to the days of Wedgwood in England, and on to our own times, is enough to take one's breath away. But the art of the potter has always been most conservative of its past, and in such an art it need occasion no surprise to find the latest and youngest experimenters among us eager to emulate the successes achieved centuries ago by men whose very names are forgotten, but whose works survive, "Like good deeds in a naughty world."

Even a cursory glance at such a collection, the like of which has probably never been gathered together on a lecture-table before, shows that the one feature which all the "lustres" have in common is a shining metallic quality of surface, which marks them off from every other kind of pottery decoration. Though this quality is more or less manifest in all the decorations of this class produced during the last thousand years, let us study it first in the so-called copper and silver lustres of our everyday English pottery, introduced a little more than a century ago. Here, at all events, the metallic quality is developed to the utmost, for pottery covered all over with such lustres as these recalls at once the characteristic appearance of vessels shaped in metal, and there can be no doubt that the Staffordshire and other English potters of the late eighteenth and early nineteenth century thought they had discovered a delightfully simple method of making their pottery look like metal, for they shaped their vessels in exact imitation of those of the silversmiths and goldsmiths of the period; and as they were mechanically-minded people they modelled their mugs, jugs, sugar-boxes, teapots and candlesticks as accurately as possible on the popular Sheffield plate of the day. All unconsciously they seem to have been following the example of the first inventors of the lustre decoration, for there is no doubt in my mind that the potters of Egypt, Syria and Persia, who made the first "lustres" in those far-off centuries when the East was still the cradle of the arts and sciences, also hailed their invention as a brilliant discovery that enabled them to make pottery look like gold.* We are so accustomed in these days to see on every hand pottery decorated with gold fired to the glaze that it is difficult to realise what a modern invention the gilding of pottery and porcelain really is. Gold fired on to the surface of glazed pottery appears to have been unknown to all the great potters of the Middle Ages. I am inclined to the opinion that the Chinese and Japanese may have taught its use to Europeans, and there is ample evidence that its use in Europe is scarcely earlier than the middle of the eighteenth century.† Where leaf gold had been applied to the surface of tiles or vases before this period it appears to have been merely attached by japanners' size, and must, therefore, be regarded as an exotic decoration, for we must refuse to consider anything pottery decoration which has not been fired.

It is all very well to grind up leaf gold with a small quantity of a soft flux, which would fix it to glazed pottery on refiring at a low temperature, but the latter part of the eighteenth century, which witnessed such an outburst of experimental work in pottery, was also the period of the fresh departure in natural science which laid the foundation of modern chemistry. Gold was being experimented with in many ways, for the old search for the philosopher's stone had only taken a fresh direction, and before the end

of the century it was found that gold could be applied to pottery by mixing a solution of the metal in aqua regia with thick oily or resinous fluids, so that when a coat of mixture was carefully laid over the pottery and fired at low heat a shining golden deposit was immediately produced without any further trouble. So far as we can learn it was some unknown experimenter in the Staffordshire potteries who first made this discovery, and during the decade of the eighteenth century the method was in extensive use in England.*

It is interesting to recall, too, how soon the newly discovered metal platinum was brought into use for the same purpose. Just as it was found that gold-chloride solution diffused in a thick oily menstruum would furnish a coat of shining gold, one of the first industrial uses of platinum was its application in a similar way to produce a shining deposit of platinum on crockery, which went by the common name of silver lustre, because of its resemblance to that metal in appearance and because the name "platinum" would have meant nothing to the ordinary person at that period. I always like to imagine myself to be the introduction of these shining metallic deposits of gold and platinum owed much to our greatest English potter, Josiah Wedgwood, for from his intimate connection with the best scientific men of his day he is likely to have learned about such a substance as platinum before any other Staffordshire potter, and Professor Church has informed me that he obtained some information on the subject of lustre from Dr. John Fothergill, as early as the year 1760. Certainly, too, Wedgwood was one of the potters who made extensive use of these gold and platinum lustres, though other Staffordshire potters were active in the same field in the late years of the eighteenth century, and the method seems to have been pretty widely spread, as it was so practised at Swansea, Leeds and Sunderland.

There are many examples exhibited here to-night which enable us to realise what these English lustres were like. The deposit of metallic platinum is always dense and metallic, so that vessels coated with it shine almost as brightly as silver, hence the unfortunate name of "silver" lustre has been generally given to it. The gold lustre is sometimes quite as dense, though we often meet with it so thinly that the colour of the pottery on which it has been applied is an important factor in determining the colour effect. On white or cream colour ware, if the lustre is thinly applied it gives only a pale purplish stain, with a faint golden sheen; but on red pottery, or where it is thickly applied it may look like gold, copper or bronze. Sometimes copper was added to the gold to produce a darker and more bronze-like effect.

If we were to consider the production of a metallic lustre on pottery as the true aim of lustre, then this English pottery of the late eighteenth and early nineteenth centuries must be regarded as the most perfect lustre pottery ever made, for nothing could exceed the evenness and regularity of its shining metallic surfaces.

The metallic quality of surface is, however, only one feature of the finest lustre effects, and neither the most important nor the most beautiful one. If we examine examples of the fine lustres of the Persian, Spanish or Italian pottery we shall find that the decoration, however strong and metallic it may be in certain lights, is softened and beautified by a wonderful play of iridescent colour, so that it assumes something of the changing quality of the inside of a peacock's shell, or is diversified by a play of brilliant colour like soap-bubble or the feathers of a peacock's tail. But these qualities the metallic films of gold and platinum are entirely deficient, for they present nothing but a dazzling unbroken surface like a sheet of pure metal. I must assume that everyone knows nowadays that these brilliant interference colours—soap-bubble colours—one may well call them—of true lustres are due to the presence of thin films, and the process which gives us the hazy

* Mr. Henry Wallis has suggested that, as it was considered derogatory in Byzantium, during her prosperous days, to eat or drink from vessels of other metals than gold or silver, in her declining years, when the precious metals had been gradually absorbed, the potters would copy designs from the gold or silversmith, and the lustred ware became a cheap but showy substitute for the precious vessels which had previously enriched the Credenza. In Spain, too, the old lustred ware is known as "Dorada," i.e. "gilded," and Ibn-Batuta, the famous Arab geographer and traveller, writing in 1350, speaks of the ware made at Malaga as the "gilt pottery or porcelain which is exported to the most distant countries."

† When the King of France, Louis XV., became financially interested in the porcelain factory at Vincennes, shortly before its removal to Sèvres, it is recorded that a large sum of money was paid to a Benedictine friar, named Hippolite, for the secret of gilding decoration; and yet Vincennes appears to have been the first European factory that used gold at all extensively in the decoration of porcelain, and it was at that time not used on pottery or faience at all. The famous Wedgwood appears to have had great difficulty in acquiring a knowledge of how to apply fired gold to pottery, and almost his only patent has reference to an imperfect method of gilding.

* Simeon Shaw, in his *History of the Staffordshire Pottery*, published in 1828, ascribes the invention to John Hancock, though he also mentions a decorator named Hennys as having been concerned in its introduction. But Shaw was a most critical and unreliable purveyor of gossip; he frequently publishes contradictory statements, and personally I attach very little importance to his statement. It is a matter of painful interest to an English potter to realise that this process invented in England is directly to the production of liquid gold, which is now sold to German firms to the Staffordshire potters to the amount probably of 100,000*l.* per annum. On a small scale it is the story of the aniline industry over again: the Englishman acting as inventor and then, from want of sufficient scientific knowledge, losing the trade to the better trained German.

allic deposits of gold and platinum is opposed to the luction of metallic films sufficiently thin to be iridescent. iridescent films are most easily produced from other als such as bismuth, silver and copper, precisely use these metals are capable of being tarnished or ised in air, while gold and platinum are not. I have, for instance, thin sheets of the four metals—gold, inum, silver and copper. One of these sets has been free from action, while the other set has been exposed ely to the action of damp air and gentle warmth. You at once that the gold and platinum retain their bright- unimpaired; the copper and silver, while they have something of their original brightness, have acquired ead a play of iridescent colour.

The only form of pottery decoration which in my ion ought to be called lustre is that which exhibits des the metallic sheen this play of iridescent colour, wn here on thin sheets of copper and silver, and it ld be much better, in my opinion, if our so-called lish lustres, made with a basis of gold or platinum, e described as "plated" or "metallised" pottery, so as void the confusion into which many writers and col- ors have fallen of treating these not very artistic pro- s as if they belonged to the same category as the ndid lustres of old time.

During the last year or two fresh attention has been lo to the lustre process in this country, especially by Bernard Moore, the famous Staffordshire potter, and elves, and although we are the best of friends and ly criticise each other's work, neither of us knows the ess used by the other. I should like to say that I sider many of Mr. Moore's effects not only novel in selves but strikingly beautiful. Of the work made at own factory I cannot speak, but there is a collection of ere to-night which may, I hope, speak for me.

I should like, however, to give a short account of the esses that we have found best adapted to the purpose, such an account may help to clear up certain mis- ceptions that have been prevalent with regard to the old re processes. I have described the old methods and erials as accurately as I can, and I have stated, as the lt of my experience, that they will produce perfect and iful lustres. There is, however, no reason, so far as I ee, for adopting the old Spanish or the Italian methods preparing the lustre mixture. All that is necessary is a some compound of copper or of silver, or mixtures of wo, should be mixed with a suitable proportion of e inert substance, which can be either china-clay ny ordinary red-brick clay. It is necessary that a copper or silver compound used shall be pure t of standard composition. The sulphides, oxides or onates of the two metals answer perfectly, and they e on the whole, to be preferred to the chlorides or the tes. The mixture of clay and metallic salt having been fully ground, like any other pottery pigment, can be ated over the fired glaze, using any ordinary potter's um; that is, they can be painted on with turpentine n fat oil, with sugar and water, or, as the Mediæval ers did, with vinegar. I believe that generally the inental practice is to use vinegar, and the Italians ress that no other medium works so well, but that does agree with our experience. The pattern having been kly painted on, the pieces are then placed in a special le kiln and fired, and that is where, I believe, the most rtant part of the whole process resides, and where, I z, we have probably made the greatest advances. I recall Piccolpasso's statement that the firing of lustre was a very uncertain process, and that n not more than six pieces were good out of a ured; and I have understood from Mr. De Morgan at times his experiences were almost as dishearten- . When we consider the rude and elementary ods used for firing lustre, this is hardly to be won- ed at, because such firing must often have been irregular, the result that the smoking would be equally irregular . The first necessity is to design a muffle kiln that can ised to an even temperature throughout, but that only ssitates careful kiln construction. The next point is e correct ascertaining of the requisite temperature, e use the lustreing process takes place at a red heat ow as to be barely visible, and the ordinary trials on h a potter relies for judging the temperature of his are useless, but with a well-constructed kiln and a etent fireman there should be little difficulty in obtain- he proper temperature in a great proportion of the kiln. he next point is the admission of the reducing gases or

smoke. Here again, perhaps, I may clear up a little mis- apprehension. It has been suggested by many writers that the peculiar beauty and softness of many of the old lustres may have been due to the special fuel that was used for the purpose, and some will have it that broom or rose- mary is the only fuel which will produce a suitable smoke for the purpose. Such an idea is quite erroneous. Cer- tainly, if broom is plentiful, it produces a very nice and not too dense smoke; but any kind of wood will produce equally good results, or, as Mr. De Morgan stated, sawdust or shavings will answer the purpose just as well, while even resin and pitch could be used. As a matter of fact, the reduction is much more evenly effected by the use of reducing gases, such as a mixture of carbon-dioxide and carbon-monoxide, or ordinary illuminating gas. For this purpose the muffle is best constructed in iron with tapped pipes passing into and out of the kiln to allow for the slow passage of a current of the particular gas to be used. Then when the correct temperature has been reached, after sweeping out the small quantity of air that remains by a current of carbon-dioxide, carbon-monoxide or coal gas can be admitted and the reduction takes place very regularly and steadily. It will be found, however, in practice that it is very necessary to arrange the pieces in the kiln in such a way that the currents of gas are diffused as uniformly as possible through the kiln from top to bottom and from side to side; indeed, it is astonishing how difficult it is to avoid the setting up of currents of gas in given directions, so that the pieces are more quickly reduced on one side than on the other. In our own case the temperature, intensity of the reducing gases, and the rapidity of current are so perfectly under control that our kilns are hermetically sealed through the whole process, and we never draw a trial of any kind.

When the pieces are taken out of the kiln they are still coated with the lustre pigment, which can, however, be easily scrubbed away with soap and water, unless the temperature has been too high, when it will be found that the lustre mixture has been fused into the surface of the glaze, leaving a nasty grey non-metallic film and a spoilt piece of ware.

Certain very interesting effects have been brought to light in the course of our work to which I may direct your attention, particularly as they do not seem to have been mentioned before in any description of the process.

The first effect of the lustre firing is apparently to vola- tilise some compound of silver, which penetrates into the glaze, giving it a yellowish stain, and this yellow stain is produced long before there is any stain from the copper compound, and whether the kiln atmosphere is reducing or not. On the contrary, no stain appears to be developed from the copper until the atmosphere is powerfully reducing, and then the red stain makes its appearance and slowly deepens during the whole time of reduction. More- over, if the firing is conducted for a long time these volatile stains of silver and of copper slowly spread over the whole of the glaze surface, so that if you take a perfectly white vase and cover its surface fairly well with a foliated pattern in silver or in copper the ground of the piece may become entirely yellow or red as the case may be. Another thing that is very noticeable is the greater ease with which silver gives lustre than copper. It follows from this that where mixtures of silver and copper are used together the actual quality of lustre produced will depend not so much on the nature of the mixture itself as on the temperature and duration of the firing. It is quite possible, indeed, by under-firing a mixture of silver and copper to produce an effect which would lead anyone to suppose that the lustre had contained silver alone. A great deal has also been said as to certain glazes being much better for lustreing upon than others. There is some truth in this idea, but not very much, for we have found it perfectly possible to produce excellent lustres on glazes of every type—leadless glazes, lead glazes and glazes with or without oxide of tin. The only type of glaze which seems to be impermeable to the stain of silver and of copper at the lower temperature required for the effect is the felspathic glaze of hard-paste porcelain, and that I suppose is the reason why the Chinese have never used the lustre process in the decoration of their porcelain.

Having stated as clearly as I can how both the old and the new lustres were made, it now remains to add that of course the value of the lustre process depends entirely on the artistic use of it. The effects of lustre are so beautiful in themselves, and may be made so striking and powerful, that the dangers attendant on its misuse are probably

greater than with any other process in the decoration of pottery. Having reduced the scientific and mechanical sides of the process to something like order and method, it is our earnest endeavour to use the beautiful results that have been placed in our hands in such a way as to produce a new English pottery as artistic and beautiful as that of the Middle Ages. To this end we have gradually gathered together what I may describe as a school of young English artists, all of whom have had some training in various art schools of the country under the control of the Board of Education. Every piece of lustre pottery we produce is unique, for either the designs are original conceptions or adaptations of the painters themselves, or in cases where we have been fortunate enough to obtain designs from distinguished decorative artists like Mr. Walter Crane, no two pieces are reproduced in the same way. Notwithstanding the perfection to which the chemistry of the process has been brought, the method must always remain liable to variations, which also serve to give variety to the pieces. As in old times, the best pieces are not made by invention alone, because out of a dozen pieces equally well painted and fired one, perhaps, will have a quality surpassing all the rest. Yet I never look on a collection of fine lustre pieces, such as has been exhibited here to-day, without in my mind parodying two lines of Omar Khayyám:—

I often wonder what the potter buys
One-half so precious as the things he sells.

A CARLYLE MEMORIAL.

IN view of the correspondence in our columns this week, I says the *Glasgow Herald*, on the Carlyle Memorial, it may be of interest to state exactly how the matter stands. With the history of the movement the public are more or less familiar. At the centenary dinner in Edinburgh in December 1895 it was suggested that steps should be taken for the erection of a memorial to Carlyle. The committee which had charge of the arrangements were deputed to consider the suggestion, and an executive committee, with Professor Masson as chairman, was appointed. After much deliberation the committee decided that the most fitting memorial would be a bronze replica of the famous Boehm statue on the Thames Embankment at Chelsea. The necessary consent of Boehm's executors and of Lord Rosebery, the purchaser of the marble statue, having been obtained, an appeal drawn up by Professor Masson was widely circulated. The appeal, continues the *Herald*, brought the beggarly response of 199*l.* from 92 subscribers. Shortly thereafter other appeals, some of them of national interest and of more immediate importance, were issued to the public. There were the memorials to Mr. Gladstone, to Robert Louis Stevenson and to Queen Victoria, while the South Africa war funds made a heavy call on the surplus cash of the community. Accordingly, having at the time made what they conceived to be their best effort, the executive allowed the matter to rest till a more propitious day should arrive.

Recently it was again taken up, and it was suggested that if the scheme for a reproduction of the Boehm statue could not be carried out, an alternative proposal for a medallion in St. Giles's, Edinburgh, might meet with the necessary measure of success. A design was prepared by Mr. Pittendrigh MacGillivray, R.S.A., and the consent of the authorities of St. Giles's for its erection obtained. The subscribers were communicated with, but with a section of them the proposal did not meet with favour, and eleven intimated that their subscriptions, amounting to 36*l.*, would not be available for that purpose. Lord Rosebery, indeed, forthwith handed over his promised 25*l.* to the blind asylum. Since then the executive have received some 75*l.* of additional subscriptions, practically all for the Boehm scheme. The executive, however, are prepared to carry through whichever of the two proposals becomes possible. For the medallion something like 100*l.* is still required, and for the larger scheme of the statue some 350*l.* more. Nobody will accuse the executive of excessive diligence in the matter, and yet it must be allowed that circumstances have been rather against them than with them in their work. It was their intention to have had last winter a public meeting with a view to stirring up some enthusiasm for the proposal, and efforts were made to get the Lord Chancellor—a Dumfriesshire man—to preside, but they failed. Lord Ardwall, a gentleman closely associated with the county, was also mentioned as a possible chairman, but the pro-

posal to hold a public meeting has in the meantime been abandoned till the late autumn, when it is hoped to organize such a meeting as will give the necessary stimulus to movement. It has been suggested that in the meantime the Town Council of Edinburgh should be asked to set aside a site in Princes Street Gardens for the proposed memorial. Lord Provost Gibson is understood to favour the proposal, and if the application were granted it is thought that the taking of such a practical step would encourage the flow of subscriptions.

There are not wanting enthusiasts in the movement. Mr. David Wilson, of the Indian Civil Service, himself author of a volume on Carlyle, is a warm supporter of the proposal. Mr. Andrew Carnegie has subscribed 25*l.*, George Reid, R.S.A., has given 5*l.*, and the list of subscribers includes the names of Lord Mount Stephen, S. R. Crockett, Mr. Alexander Ure, K.C., M.P.; the Robert Wallace, M.P.; Mr. J. A. Campbell, of Stracathro; Sir Thomas Glen-Coats, Professor Saintsbury, the Colonel Wauchope and Dr. Wallace Williamson. A lady, writing from the Highlands, enclosing a subscription, concludes a vigorously worded letter thus: "The Carlyle should want a monument, or have but a second-rate one, while they stick one up every other day, every little whipper-snapper—!" Professor Masson, though no longer able to take any active share in the work of the executive, is still anxiously desirous to see the Boehm scheme carried out. Discussing a suggestion recently made for the issue of another appeal, he thinks there should be no rebuke and no arguing on behalf of the propriety of such a monument. "It would be of keeping," he writes, "in an official appeal to read expressions of that kind about Carlyle and his work, which there have been scores in books and essays about him for the last fifty years and more. His mere name is enough now for all who will take any interest in the proposed memorial, and I think the official appeal that might go forth ought to be a brief business document, stating simply, and then soliciting subscriptions for the contemplated copy of Boehm's statue to be set up in Edinburgh, leaving the readers to their own already formed conception of Carlyle, and not arguing about him at all or pleading his case at all. There may be differences among people as to their reasons for admiring Carlyle, with perfect unanimity in the matter of his extraordinary greatness in all, but let each subscriber subscribe for his own reasons." There the matter stands. In the meantime Councillor Douglas Elliot, 40 Princes Street, Edinburgh, honorary treasurer, will be glad to take charge of the subscriptions on behalf of the memorial.

DUNDEE CITY CHURCHES.

IF the opinion of Mr. Macgregor Chalmers, architect of Glasgow, is adopted, the Dundee city churches, as they are at present known, will be razed to the ground and replaced by handsome new buildings erected. The subject of the demolition of the fabric in which St. Mary's, St. Clement's and St. Paul's congregations have their churches has, says the *Dundee Advertiser*, recently engaged the serious attention of the Town Council and the general Kirk Session, and a former body some time ago came to the conclusion, as a result of a report by Mr. James Thomson, city architect, that by spending 4,500*l.* their obligations to place the buildings in a condition covered by the phrase "wind and water-tight" would be met. This sum the Town Council's principal heritors were prepared to spend, but a more contentious scheme involving an outlay of between 7,000*l.* and 8,000*l.* was suggested whereby the architectural features might be restored, the Kirk Session to raise the balance of the expenditure. The Kirk Session, after negotiations with the works committee, and having the two schemes explained to them, passed the matter over to the Presbytery, who in turn called in Mr. Macgregor Chalmers of Glasgow, an architectural expert, to examine the fabric and give his opinion regarding the proposals. In the form of a typewritten report Mr. Chalmers submitted his views to the members of the committee of Presbytery specially elected to deal with the matter. Although the utmost secrecy is being maintained as to the terms of the report, it is understood that Mr. Chalmers does not approve of either of the schemes proposed, although of the two would prefer the larger, but even it would mean that twenty-five years' time further heavy expenditure would be involved. The building, he points out, is rapidly decaying.

the soft stones having been seriously affected by the weather, and instead of proceeding on the lines proposed, he expresses a firm opinion that the question of erecting new buildings could be faced. The Old Steeple, he says, is one of the best of its kind in Scotland, but even here the atmospheric conditions have affected the stones which were introduced when last repairs were made on it, and these are not in such a good state of preservation as the original stonework. The committee, after consideration, agreed to have a conference with a sub-committee of the general Kirk Session before bringing the matter before the Presbytery at its monthly meeting.

THOMAS GIRTIN.

THE Board of Education have acted wisely in including three examples by Thomas Girtin (Turner alone giving four) in their first circulating collection. The memory of Thomas Girtin is too intimately interwoven with that epoch which raised the title of draughtsman to that of painter in water-colours to be forgotten in any semblage which professes to be representative of the art. That painting in water-colours is an art of modern invention is universally known, and that the credit of the recovery is due to the British artists is equally admitted. The title had been achieved worthy the name of art by the draughtsman until about the middle of the eighteenth century, when the study of linear perspective having been successfully cultivated, the artists made some successful attempts at topographical drawing, or the representation of actual views of towns, cathedrals, castles, mansions and other pictorial objects, with that fidelity to their respective forms and proportions in combination which constitutes the reliable picture.

Previously to the application of linear perspective to topographical delineation, nothing could be less natural than the representation of scenes from nature, as may be seen in all the background subjects that were intended to represent real scenes in the historical pieces painted by the artists, and even the masters of more modern times, up to the period of the latter part of the seventeenth century, when the Flemish and Dutch masters, cultivating successfully the study of linear perspective, produced those justly admired topographical works in which architecture formed the principal features of the subject.

About the middle of the eighteenth century nothing could be less scientifically set forth than views of buildings and places; for in all the works topographical, such as Hogarth's folio work (line engravings) of the colleges at Oxford and Cambridge, the topographical illustrations of Rowe's folio "History of London," and other large and expensive similar works, all the views were represented in that heterogeneous style of delineation termed "bird's-eye views," which may be considered nothing short of the grotesque of perspective.

How it happened that the British artists were so entirely wanting in perception to remain so long in ignorance of the art of correct delineation is the more surprising, as the ingenious Wenceslaus Hollar had practised so many years in England during the reigns of Charles I. and Charles II., and had made so many engraved topographical representations of various parts of London, with sufficient skill and intelligence to show them what the art was capable of. So, however, it was; and thus it continued until Paul Sandby commenced his topographical studies, and gave to the world his veritable delineations of the picturesque scenes of the island. These at once pointed out the right path to other artists, many of whom, availing themselves of his intelligence, pursued the same species of drawing and spread the knowledge of this department throughout the empire.

The graphic works of Sandby assumed very little more than a mechanical knowledge of light and shadow, being almost invariably marked in foreground, middle-ground and distance, buildings, trees, figures, cattle and every other object, with a deep pencilled outline, shadowed with Indian ink and tinted with thin washes of colour, in the tints of brick, stone, tile and slate; the trees and grass of deep greens and the sky and distances with cold unbroken blue, or blueish gray.

Michel Angelo Rooker, the next in succession, proceeded a step still further in topographical art. His views of the colleges, engraved for the Oxford Almanac for several consecutive years, were long admired as works of great merit. He moreover made the first successful approaches in his coloured studies from nature to imitate the local colour of

each object, such as bricks, stone, tile, timber, &c., with the tints which they had acquired by exposure to weather, and which render them so fitting for pictorial representation. Rooker, however, though he thus advanced the art by pointing out the proper method of study, could not combine the whole into a picture. It was even considered by him and his ingenious contemporaries and immediate successors that the process of painting in transparent water-colours could never attain to sufficient power to form a picture.

Thomas Hearne practised topographical drawing at the same period with still greater success; as his works, though not affecting force of light and shadow, and with little pretension to colour, were yet very complete in harmony, being chaste in effect and tasteful in execution, faithful in their general characteristics and beautiful in their detail. His drawings, indeed, were so replete with these qualities that Girtin and Turner owned they derived from the study of his works the rudiments of that topographical knowledge which they improved so as ultimately to raise the British school in this department of art superior to that of any other nation ancient or modern.

In this epitome of the rise and progress of water-colour art it would be injustice to the memory of John Cozens not to mention his meritorious labours in this branch of drawing, as it was he who first successfully practised that delightful attribute of scenery painting in water-colours, aerial perspective, which before his time had scarcely been attempted, from the erroneous belief that it was not to be accomplished by the limited powers of colours thus prepared.

These, then, may be considered the original founders of the school of British draughtsmen, and each having added something to the common stock of water-colour art, Girtin and his coadjutor Turner, then youthful disciples in the same department, commenced their career on the stepping-stones which their ingenious predecessors had placed for the advantage of these and others their more fortunate successors.

It would puzzle philosophy, in its wisest mood, to account for the superiority which these young artists obtained, at so early an age, over the labour of the whole long lives of these their worthy predecessors, for they worked with the same materials and from the same prototypes. The very same objects which had served them—the castles, ruined monasteries, abbey gates and other pictorial subjects which had by them been delineated—also were sought by these, but their predecessors represented them only, at the best, as tinted chiaroscuro drawings, whilst these formed them into splendid pictures; such, indeed, that connoisseurship marvelled at the achievement, and painters in oil were no less lost in wonder to know by what possibility such works could be wrought in materials apparently so entirely incompetent to the operation.

Thomas Girtin was born February 18, 1775. Whilst yet a child he evinced a predilection for drawing, having a pencil and scrap of paper in hand whenever he could possibly obtain them, and scribbled all that his childish fancy presented, to the neglect of every other consideration either of duty or amusement; yet, to quote his own words, "other boys of his own age, at ten or twelve, who amused themselves or idled in the same way, drew quite as well as himself." This candid confession may serve to stimulate the youthful student to exertion, whether studying this art professionally or as an amateur artist, as it plainly shows that to excel in painting is not, as too commonly supposed, a mere affair of inspiration.

It is almost indispensable, in attempting to describe the mode of study and practice by which Girtin attained to so great a mastery in water-colours, to incorporate the congenial pursuits of his fellow student, Turner; for the complete development of the latent powers of water-colours, which had hitherto eluded the research of the whole of their predecessors, was the result of the joint labours of these extraordinary young artists.

Whilst they were in their nonage, the venerable Doctor Munro then resided on the Adelphi Terrace. This eminent collector and intelligent connoisseur had an enthusiastic love for graphic art generally, but more particularly for water-colour drawing. He had been intimately acquainted with Wilson, Marlow, Gainsborough, Paul Sandby, Rooker, Hearne, Cozens and all who were eminent in the study of landscape; and at his select winter evening conversaziones these and other distinguished artists and amateurs enjoyed much intellectual and friendly intercourse.

During the doctor's long acquaintance with artists (for his early predilection for the arts led him whilst young to

seek their society), he richly augmented the collection of drawings first begun by his father. He possessed a considerable number of the most valuable sketches by Gainsborough, whose style he imitated with more verisimilitude than even Sir George Beaumont. He had, moreover, many of the finest drawings by Sandby, Hearne, Rooker, Cozens and others, comprising the most valuable specimens, and forming together the best collection of works in water-colours of any collector of his time. These, indeed, formed a school of examples, and no one could have applied them with more advantage to the rising artists in the same pursuit than did Dr. Munro.

This distinguished amateur threw open his collection for the improvement of certain young artists, whose promising talent he had discovered, and whose interest he felt desirous to promote. Amongst these were Girtin, Turner, Varley, Underwood, Edridge, Francia and some few others, who attended at his house on certain evenings, and there made copies and studies from the choicest specimens in his rich collection, under the doctor's auspices and direction; an advantage which could not fail to be highly beneficial, as he was a most able preceptor; indeed, his taste and judgment would have done credit to any professional artist. These valuable services he rendered to his élèves gratuitously.

The ardour and generous spirit of competition with which these youths pursued their evening studies was most exemplary, for each appeared to labour rather for the approbation of his competitor than from a jealous spirit of rivalry. With Girtin and Turner this mental contest was maintained with mutual feelings, eminently creditable to youths so equally gifted with genius and perception, and so alike endued with executive powers.

Girtin and Turner—indeed all the disciples of the Munro school—occasionally copied and studied from the same prototypes. From the elaborate and tasteful delineations of Hearne and Rooker they acquired the rudiments of a just and accurate insight into the properties of topographical design, and from the drawings of Cozens a practical knowledge of breadth and simplicity, united with the charm of the aerial perspective. Girtin and Turner combining these qualities (for we must speak of them *par excellence*, they being moreover the elder disciples of the school), and superadding their own enlightened perceptions to the knowledge thus acquired, laid the foundation of that superstructure which they raised to the glory of the British school of water-colour painting.

The progress which this ingenious evening coterie of young artists made in the course of two or three of these winter evening meetings enabled them to obtain an accuracy of eye and mastery of hand sufficient to copy with facility every example placed before them; and these indispensable qualifications fitted them to try their powers in drawing from nature.

It is a too common complaint with amateurs that they cannot, without travelling to parts remote, find fitting subjects for pictorial delineation. The imagination of one wings its way to the romantic regions where the Poussins caught their inspiration; and another sighs for the classic scenes wherein Claude found those landscape amenities which delight in his elegant compositions—vainly fancying that were they amidst such enchanting scenes they might exercise their graphic capacities to some efficient purpose.

(To be concluded.)

SMOKE ABATEMENT.

THE last report of the public control committee of the London County Council contains the following proposals:—

The administration of the various enactments as to smoke nuisance is divided up in the county of London amongst a number of authorities. Nuisance from trade premises is dealt with by the metropolitan borough councils and nuisance from locomotives is dealt with by the Council through its officers acting as common informers. We are of opinion that it would be preferable if the administration of these enactments were centralised. Nuisance from smoke differs considerably from the ordinary insanitary nuisance and should be dealt with in an entirely different manner. Smoke readily passes from one district to another; it diffuses itself in the atmosphere and creates nuisance not only in the immediate neighbourhood of an offending chimney, but also in districts far removed from the actual source of nuisance, and whilst one sanitary authority may actively administer the law in its own district, it may yet

suffer considerably through the laxity in another district. It therefore seems desirable that the Council should itself undertake the work of administration, and if the Council adopts this view and applies for the necessary powers, the opportunity might also be taken of incorporating the various enactments as to smoke nuisance in London into one statute with such amendments as we have suggested.

Serious nuisance also arises from private houses. It is estimated that half of the smoke in London comes from this source, and at the present time these are unaffected by the law. The smoke from each individual chimney may be slight, but when it is remembered that in winter probably one million domestic chimneys in London pour forth smoke daily into the atmosphere it is evident that the total volume of smoke must be very great. As indicating the great amount of smoke discharged from domestic chimneys it has been noticed that some of the densest London fogs have arisen on days when the great bulk of business premises have been closed, and a massive bank of smoke in London has been seen to rise to a height of at least 3,000 or 4,000 feet, and to be carried by the wind in a sunlight obscuring trail to a distance of fifty miles.

Dr. W. N. Shaw, of the Meteorological Office, states that he finds from comparison of records that, owing to its smoke, London loses half of its sunshine in winter and one-sixth in summer, and there can be no doubt that domestic grates contribute largely towards this evil. Many people advocate the abolition of the open fire in favour of the closed stove system in use on the Continent; but while undoubtedly the general adoption of such a system of heating would result in a purer external atmosphere, this would be secured at the sacrifice of much of the fresh air inside living-rooms, for which open fires, by providing a good deal of ventilation, are largely responsible. It is therefore unlikely that English people will abandon the open fire. Although, owing to the very nature of its construction, it seems impossible to combine in the open grate the essentials of smokeless combustion unless anthracite coal or coke be exclusively used, careful experiment and inquiry have shown that there are several open firegrates on the market which secure excellent combustion of coal and largely reduce the amount of smoke.

Much reduction of smoke nuisance from private houses may be expected through the growing use of gas and electricity for the purposes of heating and cooking, as it has been found that nearly half a million gas cooking stoves are now in use in London, and their use is steadily increasing. It has been suggested that the amount of smoke could also be considerably reduced by adopting systems of central heating, but we are of opinion that to materially diminish domestic smoke it is necessary to educate public opinion on the subject, and a step in this direction is the instruction which is given to children in elementary schools in the principles of combustion, so as to make them grasp the fact that smoke is not inevitable, but often results from the wasteful use of fuel.

We do not propose at the present time to suggest any action to deal with nuisance from this source, but it may be found necessary at some future time, unless public opinion brings about some radical improvement, to give serious attention to this grave problem.

It is extremely desirable that Government property, which is now exempt from the provisions of the Public Health (London) Act, 1891, relating to smoke, should be brought under their operation, as both the Council and the Woolwich Metropolitan Borough Council have frequently had cause to complain of the serious smoke nuisance from the chimney of the Royal Arsenal at Woolwich. In this connection we may remind the Council that the following resolution was passed at a conference of the metropolitan borough councils held on July 7, 1904, on the administration of the Public Health (London) Act, 1891:—

"That in the opinion of this conference it is desirable that the provisions of the Public Health (London) Act, 1891, as to nuisances arising from the emission of smoke, should be applied to property in possession of the Crown."

As required by standing order No. B 163, we have to state that we are advised by the solicitor that the Council has power to promote legislation in the direction above indicated provided that the provisions of the Borough Funds Act, 1872, as applied by the County Councils (Bills in Parliament) Act, 1903, are complied with, and we recommend:—

(a) That, as regards nuisance from smoke in the County of London, application be made in the next session of Parliament—

1. To consolidate existing enactments relating to smoke nuisance in London.

2. To amend section 24 (b) of the Public Health (London) Act, 1891, so as to cover any serious emission of smoke, irrespective of colour and whether issuing from a chimney or not; to provide for the imposition of a direct penalty of 10*l.* for a first offence and cumulative penalties where necessary for subsequent offences, and to give the same powers of entry to trade premises to the Council's officers as are now granted to officers of the sanitary authorities.

3. To repeal the exemption enjoyed by Government property under sections 23 and 24 of the Public Health (London) Act, 1891.

4. To amend section 114 of the Railway Clauses Consolidation Act, 1845, and section 19 of the Regulation of Railways Act, 1868, by providing that the penalty for the first offence shall be 10*l.*, that cumulative penalties may be imposed where necessary, and that the emission of dense smoke from the funnel of an engine shall be deemed an offence without the necessity of proving default on the part of a railway company or its servants either in the construction of the engine, the condition of the engine, unsuitable fuel or negligence in stoking.

5. To empower officers of the Council to enter the premises of railway companies in order to make the necessary identification of smoking locomotives.

6. To amend section 30 of the Highways and Locomotives (Amendment) Act, 1878, by providing that it shall cover the emission of smoke from a properly constructed engine through the negligent use of the same.

7. To amend section 1 of the Locomotives on Highways Act, 1896, so as to permit section 30 of the Highways and Locomotives (Amendment) Act, 1878, to apply directly to light locomotives.

8. To constitute the Council, instead of the metropolitan borough councils, the executive authority for dealing with smoke nuisance in London.

(b) That the costs and expenses of promoting the legislation referred to in the foregoing resolution (a) be defrayed out of the county fund.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A GENERAL MEETING of the Institute was held on Monday, the President in the chair, to read the minutes of the special general meeting held on Tuesday, May 28, formally to admit members attending for the first time since their election, &c. The report of the scrutineers appointed to direct the election of the Council, standing committees, &c., for 1907-8, was received.

On the motion of Mr. H. W. Wills, it was resolved that it be a recommendation to the Council to insert a clause in the revised by-laws empowering the taking of a poll on any professional question on the signed requisition of twenty-five members.

The results of the elections were as follows, viz. :—

THE COUNCIL.

President.—T. E. Colcutt.

Vice-Presidents.—J. S. Gibson, E. T. Hall, H. T. Hare, L. Stokes.

Hon. Secretary.—Alexander Graham, F.S.A.

Members of Council.—Reginald Blomfield, A.R.A., J. J. Burnet, A.R.S.A. (Glasgow), A. W. S. Cross, M.A., E. G. Dawber, W. Flockhart, Ernest George, J. A. Gotch, F.S.A. (Kettering), E. A. Gruning, H. V. Lanchester, E. L. Lutyens, C. E. Mallow, Ernest Newton, W. A. Pite, A. N. Prentice, H. R. Ricardo, J. W. Simpson, John Slater, Paul Waterhouse, M.A.

Associate Members of Council.—H. A. Crouch, W. C. Green, S. K. Greenslade, S. H. Hamp.

Representatives of Allied Societies.—Hippolyte J. Blanc, R.S.A. (Edinburgh Architectural Association), H. Dare Bryan (Bristol Society of Architects), H. S. Chorley, M.A. Oxon. (Leeds and Yorkshire Architectural Society), J. F. Groves (Cardiff, South Wales and Monmouthshire Architects' Society), E. Kirby (Liverpool Architectural Society), W. M. Mitchell, R.H.A. (Royal Institute of the Architects of Ireland), J. M. Monro (Glasgow Institute of Architects), P. Ogden (Manchester Society of Architects), A. B. Plummer (Northern Architectural Association).

Representative of the Architectural Association (London).—W. Cave.

STANDING COMMITTEES.

Art.—*Fellows*: R. S. Balfour, J. J. Burnet, A.R.S.A., E. G. Dawber, E. George, J. S. Gibson, H. T. Hare, Pro-

fessor W. R. Lethaby, E. S. Prior, M.A., J. W. Simpson, P. Waterhouse, M.A.—*Associates*: J. Anderson, A. T. Bolton, T. Davison, S. K. Greenslade, T. G. Lucas, E. Wood.

Literature.—*Fellows*: A. W. S. Cross, M.A., J. A. Gotch, F.S.A., E. S. Prior, M.A., H. R. Ricardo, Professor F. M. Simpson, Professor R. E. Smith, R. P. Spiers, F.S.A., H. Stannus, A.R.C.A., C. H. Townsend, P. Waterhouse, M.A.—*Associates*: W. C. Green, J. H. Jones, B.A., H. Passmore, A. J. Stratton, W. H. Ward, M.A., P. L. Waterhouse, M.A.

Practice.—*Fellows*: W. H. A. Berry, Max Clarke, A. W. S. Cross, M.A., G. Hubbard, F.S.A., J. D. Mathews, S. Perks, H. A. Satchell, A. S. Snell, T. H. Watson, W. H. White. *Associates*: E. Greenop, E. R. Hewitt, H. H. Langston, H. Porter, M.A., T. E. Pryce, A. W. Tanner.

Science.—*Fellows*: H. P. Adams, T. W. Aldwinckle, Max Clarke, W. Dunn, M. Garbutt, F. Hooper, C. S. Peach, H. D. Searles-Wood, A. S. Snell, L. Solomon. *Associates*: R. J. Angel, E. J. Bennett, H. W. Burrows, E. R. Hewitt, E. W. M. Wonnacott, E. A. Young.

The hon. auditors are Messrs. H. P. Burke Downing and A. W. Sheppard.

Twenty Fellows and five Associates were elected, viz. :—

Fellows.—O. D. Black (Liverpool), A. T. Butler (Cradley Heath), S. B. Caulfield, P. B. Chatwin (Birmingham), P. H. Currey (Derby), F. B. Dunkerley (Manchester), N. Fitzsimons (Belfast), D. T. Fyfe, L. W. Green, John Hartree (Hereford), H. T. D. Hedley (Sunderland), W. M. How, P. M. Johnston, W. Scott-Deakin (Shrewsbury), W. S. Skinner (Bristol), W. Stewart, Henry Tanner, jun., J. A. Thomas (Surrey), H. Tooley, K. M. Young (Belfast).

Associates.—T. C. Agutter, S. C. Brittingham (Melbourne), W. Hooker, K. G. Rea (Montreal), S. J. Wearing (Leicester).

LOWERING THE PROFESSIONAL STANDARD.

THE following correspondence has passed between the late President of the Quantity Surveyors' Association and the late President of the Surveyors' Institution :—

20 Mecklenburgh Square, W.C. : April 9, 1907.

Dear Mr. Langridge,—As a Fellow of the Surveyors' Institution, I was very pleased to see in a memorandum issued by that body, signed by you and sent to local authorities, &c., the following, viz. :—"That any system by which the financial return for professional work is reduced below the point at which it becomes remunerative to properly trained and qualified men must tend to lower the professional standard." I welcomed that sentence especially, because I believe it is the first explicit public statement that the Council of the Surveyors' Institution regard disgraceful cutting down of charges as tending to lower the professional standard. Now that the Council have once properly and publicly branded the practice, and brought those who are guilty of reducing the financial return below the point at which it becomes remunerative to properly trained and qualified men within their own definition of "tending to lower the professional standard," I suppose there can no longer be any doubt that the Council mean to take the necessary steps to compel Fellows of the Institution to cease "lowering the professional standard," or expel them.

When your Council are ready to hold an inquiry, I can have brought before them for a first case a glaring instance of a Fellow of the Institution tendering to supply the quantities for some new schools supposed to cost about 20,000*l.*

I believe the County Council scale for work between 5,000*l.* and 20,000*l.* is 1½ per cent. The Quantity Surveyors' Association scale for school buildings for work between 10,000*l.* and 20,000*l.* is 1⅓ per cent., and for work between 20,000*l.* and 30,000*l.* 1¼ per cent. Hurst's scale is 1½ per cent. on the first 10,000*l.* and 1 per cent. on the remainder.

The Fellow of the Surveyors' Institution agrees (since the issue of your circular) to do the work for ½ per cent. Is not that "tending to lower the professional standard?" Should it not be brought before the Council as "disgraceful conduct in his profession as a surveyor," bringing him within Rule 19?

I shall be glad to have your views, as President of the Institution, on this subject, of so much importance to all quantity surveyors, and to assist you in any inquiry or in any other way I can in the interests of the profession.—Yours always faithfully,

(Signed) A. J. GATE.

To George Langridge, Esq.,

President of the Surveyors' Institution,

Great George Street, S.W.

The Broadway, Tunbridge Wells: April 11, 1907.

Dear Mr. Gate,—Your letter of the 9th inst., directed to me at the Institution, received. I am thoroughly in accord with the memorandum issued to the local authorities by the Council of the Institution, and from the information brought to their notice, it seemed most desirable to bring the Council's views on the subject before the authorities. Personally I strongly object to anything in the nature of touting for work, or putting surveyors into competition with regard to the amount to be charged for their services rendered, and I should like, as far as possible, to impress this view on the members; but, as you know, there are outsiders, and the question of proper fees for services rendered in a Society so widely extended seems one in which it would be difficult to make a rigid rule. In this I am giving my views as a member only, and not as President of the Council.—I am, dear Mr. Gate, yours truly,
A. J. Gate, Esq. (Signed) GEORGE LANGRIDGE.

20 Mecklenburgh Square, W.C.: April 22, 1907.

Dear Mr. Langridge,—Thank you for yours of the 11th inst., but it does not quite answer mine of the 9th. I am pleased to have your assurance that personally you would like to impress on your members that you strongly object to surveyors competing as to their charges; but what I want to know is whether, as President who signed the recent memorandum, you will take the necessary steps to make them cease doing it to the disgraceful extent now prevalent.

The Institution's charter was granted on a petition in which it alleged that its object was "improving the status and regulating and shaping the customs and usages of surveyors," and on a plea in that petition that the grant of the charter would be "according to the Institution a position by means of which it will be better able to exercise an influence towards maintaining a high standard of rectitude among the members of the profession."

I, and other members of the Institution, are of opinion that as regards quantity surveyors the Institution is certainly not carrying out the objects of its charter; but, instead of improving it, is allowing its members to seriously lower the status of surveyors, and that it is utterly failing to regulate the customs, even of its own Fellows, when a Fellow of the Institution is allowed to tender to supply quantities for a 20,000*l.* school at $\frac{1}{2}$ per cent., and the Institution does nothing to stop such tendering.

If I send you necessary particulars, the name of the Fellow, &c., will you bring the matter before your Council to take steps to stop such undoubted lowering of charges of quantity surveyors? Surely the grant of your charter requires you to take action in such a case.

I am, dear Mr. Langridge, yours always faithfully,
(Signed) A. J. GATE.

To George Langridge, Esq.,
President of the Surveyors' Institution,
12 Great George Street, S.W.

12 Great George Street, Westminster, S.W.:
April 24, 1907.

Dear Sir,—In reply to your letter of the 22nd inst., I am desired by the President to inform you that the policy of the Institution has always been to leave the question of fees to the individual discretion of members, and that this policy was confirmed at the recent general meeting called to consider this matter.—I am, dear Sir, yours faithfully,
(Signed) A. GODDARD.

A. J. Gate, Esq., 20 Mecklenburgh Square, W.C.

20 Mecklenburgh Square, W.C.: April 26, 1907.

Dear Sir,—Thank you for yours of the 24th inst. Without that I was already only too well aware what the policy of the Institution has always been.

It is that policy I object to, as a Fellow who has a right to ask that the Council shall perform the duties for which its charter was granted.

Allowing its Fellows to compete for work at any starvation prices absolutely at their individual discretion may be the President's and Council's idea of "improving the status and regulating and shaping the customs and usages of surveyors," but it is not mine. I can only consider it deliberately ignoring and refusing to carry out the terms of its charter.

Whether the President and Council are, or I am, right, I leave to those of my professional brethren who, like myself,

regret the low status to which the profession is sinking under such "improving" and "regulating."

As the correspondence clearly brings out and leaves no possible doubt as to the deliberately expressed policy of the Institution, I propose to publish it as being of the graves concern to all quantity surveyors, and in the hope that the responsible and respectable members of that profession will see the necessity of at once taking steps to protect their interests and dissociate themselves from the insane policy of the Council before it is too late.—Yours always faithfully,
(Signed) A. J. GATE.

To the Secretary, the Surveyors' Institution:
12 Great George Street, S.W.

GENERAL.

Mr. W. M. Mitchell, F.R.I.B.A., R.H.A., the president of the Institute of Architects in Ireland, has been appointed by the Kingstown Urban Council to act as assessor, at a fee of 75 guineas, in the selection from the competitive designs for houses in Kingstown of those two which will best comply with the particulars of the competition. The assessor's attention is to be directed especially to the financial limitations. It is expected that there will be 200 competitors for the prize of 100*l.*

Mr. H. T. Steward has been appointed by the Council of the Surveyors' Institution to fill the vacancy in the Tribunal of Appeal caused by the resignation of Mr. J. W. Penfold.

Mr. William Strang, A.R.A., has been elected member of the Council of the International Society of Sculptors, Painters and Gravers.

The First Prize (5,000 francs) in the competition for the Palais de Justice, Sofia, has been granted to M. Balley, of Saintes; the second prize (3,500 francs) to M. Girette, of Paris; the third (2,000 francs) to M. Lazaroff, of Sofia; and the fourth (1,000 francs) to M. Bourgeois, of Poissy. There were thirty-five competitors.

An American Academy of Art in Rome is likely to become an actuality before long. Mr. Pierpont Morgan, Mr. Henry Frick and Mr. W. Vanderbilt have subscribed 200,000*l.* for the purpose of founding it.

The Finance Committee of the London County Council recommend that Mr. Edwin Waterhouse, F.C.A., be asked to report, in continuation of his report, dated March 15, 1897, upon the accounts of the works department, and generally as to the position of the department from a commercial point of view; and that in the event of Mr. Waterhouse not being prepared to make the report referred to, Messrs. Price, Waterhouse & Co., chartered accountants, be asked to prepare such report.

The Chemical Laboratory of the University of Cambridge is to be enlarged from plans by Mr. Stevenson, at an estimated cost of 13,500*l.*

The First Commissioner of Works, in response to a Parliamentary question as to whether the stone for the late Queen Victoria Memorial was being prepared by foreign workmen said:—"The work for the Queen Victoria Memorial is not under the charge of any Government Department, but is carried out by the committee appointed to dispose of the fund which was raised by national subscription. I understand that marble, which is being quarried for the purpose at Carrara, is being prepared by the workmen on the spot before it is shipped to England."

In Reply to a Question put in the House of Commons, it was officially stated that an appointment is about to be made to the headmastership of the Metropolitan School of Art, Dublin. The suggestion that the sums which have lapsed to the Treasury by the long vacancy in the post should be recovered and applied to the purposes of the art school is impracticable. The unexpended balance of salaries must, in the usual course, be surrendered to the Exchequer.

The Bournemouth Town Council have approved a recommendation from the education committee that a central art, science and technical school be erected at an estimated cost of 25,000*l.* A proposal to erect a public swimming bath in the Springbourne district at a cost not exceeding 6,000*l.* was lost.

M. Paul Leroi (Léon Gauchez), the editor of *L'Art*, died suddenly on the 8th inst. He was the most fearless of critics, but a large number of artists owed their success to his influence and generosity.

The Architect.

THE WEEK.

Is it not desirable for the London County Council to come to a decision concerning the proposed County Hall? The establishment committee on May 9 prepared an elaborate report on the subject, in which they said "that the best course for the Council to take is to go on with the scheme with all possible despatch." But the Council have not considered the subject at any of the meetings since the report was submitted. It is also worthy of notice that the finance committee have recommended that there should be a conference on the expenditure. It was also considered desirable to expend 350*l.* on borings at the site, but there is delay in that matter. We do not suppose that if there should be a change in the policy of the Council on the subject it would affect the conditions of the competition. Architects, however, prefer to be without any doubt about their position, and until the Council approve of the recommendation of the committee there must be misgiving about the carrying out of any of the designs.

THE Manchester City Council have adopted the report of the special committee appointed to inquire into the establishment of a works committee. The committee had reported against the proposal. But one of the members said they had been guided by the experience of the operations of the Works Department of the London County Council. One instance of the London system was mentioned, and it is so amusing as to be worth reprinting. A report was received that a lamp was broken in a suburb of London two miles away from the department works. A man was sent to examine the lamp. He came back and reported that it would have to be brought to the works to be repaired. A man and a horse and cart were sent for it and specifications for the repairs were got out. Various workmen were put on the job, care being taken that there should be no overlapping—that a tinsmith should not do the work of a painter, for example—and eventually the lamp was repaired and refixed. When the cost came to be reckoned up it amounted to 3*l.* 17*s.* 6*d.* A brand-new lamp could have been bought for 25*s.* Those who have studied the operations of the Works Department in London will agree that the case exemplifies on a small scale the circumlocutionism which is the character of pseudo-Government departments. Whether the Works Department will be soon abolished it is difficult to say, but there can be little doubt that greater reliance will be placed on ordinary contractors than was allowed in recent years.

THE value of an architect's final certificate is so clearly understood in England that objections to it are rarely recognised by the Courts. Although English precedents are supposed to have almost equal authority in the United States, it would appear as if the final certificate is not self-sufficient, but requires other conditions which are not always respected in this country. A case which exemplifies the difference has been decided in the Court of Appeals of the District of Columbia. A contractor agreed to erect twenty-one brick houses in Washington according to drawings and specifications by an architect. It was agreed that payment was to be made in the manner and at the time set out in a schedule of payments signed by the parties and made part of the deed. The original contractor withdrew, and handed over the work to a trust company. When the work was completed the architect gave a certificate, and payment was demanded according to the agreement. The owner claimed damages because of delay by which the value of the houses was diminished. The Court held that a contract to perform work in the best manner and with materials of the best quality in accordance with plans

and specifications does not make the acceptance by the architect final and conclusive; the contractor is not relieved from the agreement to carry out the work according to plans and specifications. The architect's certificate was not to be accepted as conclusive unless there was a statement to that effect in the contract deed which was not open to a charge of ambiguity. The decision, of course, affects not only building but engineering work. The questions may well be asked, If the architect or engineer is not competent to decide about the carrying out of his own plans and specification, who is better qualified and on whom is the expense to fall for the extra investigations?

ACCORDING to the Workmen's Compensation Act, any workman receiving weekly payments under the Act shall, if so required by the employer, submit himself for an examination by a medical practitioner. A case of the kind occurred in 1905. Arbitration followed, but as the judge considered the medical evidence contradictory a medical referee was called in. The referee found the man was able to work as an unskilled labourer, and the judge ordered that payments should cease. In three months the man found he was unable to continue working, and an effort was made to reopen the case. After passing from one Court to another the case came before the House of Lords on Tuesday. Lord HALSBURY said the arbitrator could have kept the employer's liability alive by ordering the payment of a penny or a shilling a week. But as the arbitrator, who, as usual, was a County Court judge, had not done so, there was an end to the case. Their lordships' decision is in keeping with the principle that an action at law cannot be brought to obtain compensation which can be recovered under the Act, and that all questions which arise must be settled by arbitration. Unfortunately arbitration is not more infallible in dealing with workmen's compensation than in other matters.

THE excavations at Timgad, in Algeria, have within the last few weeks revealed the existence of a great Christian church in the eastern part of the city. The length of it was about 280 feet and the width 82 feet; there was also a parvis or forecourt of the width of the church and a length of 26 feet. There was evidently a mortuary chapel, in which were sarcophagi. The church is supposed to date from some time in the fourth century, and was used by the Donatists. They were followers of DONATUS, who had been orthodox Bishop of Carthage. But after his condemnation by the Council of Arles he founded a sect which extended over the greater part of Northern Africa. Hitherto Timgad has been associated with Roman work. But evidently its inhabitants must have had a varied history, and by the time M. ALBERT BALLU, the architect who has control of the researches, completes his work it will be possible to spell out many points in its history from the architectural monuments.

THE report of the Architects' Benevolent Society states that the income would have been insufficient to meet the years' demands if it were not for the 100*l.* added to the income and 175*l.* added to the capital account obtained through the letter of appeal sent out by Mr. COLLCUTT. During the year eighty applications for relief were received, and seventy-five grants, amounting in all to 743*l.* 12*s.* 6*d.*, were distributed, in addition to 183*l.* 15*s.* paid to pensioners. The expenses amounted to 132*l.* 1*s.* 5*d.*, and the balance is 50*l.* 19*s.* 2*d.* The disbursements, apart from the pensions, exceeded the subscriptions by 60*l.* It will therefore be evident that additional subscribers and bequests are desirable. Business is not flourishing, but it seems surprising, considering the number who practise as architects, that a larger sum is not obtainable. The Council, however, consider the past year was marked by increased prosperity as well as usefulness.

SCOTTISH ARCHITECTS.

THE exhibition in Edinburgh which was arranged by the Edinburgh Architectural Association in 1882 included work by English as well as Scottish architects. Another exhibition which was opened this week in Edinburgh is, with one or two exceptions, confined to native work. The same building—the Royal Scottish Academy—is again used. But instead of 1,200 drawings there are now only about 500 to be viewed.

One of the most interesting works is the portrait of JAMES CRAIG. The architect's name is not familiar in the south. But in our days when so much is said about laying out streets and town improvements it deserves to be recalled. In no other city has so much success followed a design. People who now walk along Princes Street and look at the beautiful gardens which bound it on one side cannot imagine the extent of the improvement of which CRAIG was the pioneer. Scotsmen loved the Old Town in spite of its numerous sanitary shortcomings. When expansion could no longer be evaded it was proposed to utilise the ground on the south side of Edinburgh. But Provost DRUMMOND, who was then in authority, considered it would be preferable to erect a new town on the north side. His project seemed to be impracticable, for the valley, in which are now the gardens and railway, was under water. It was a long if not a deep lake. DRUMMOND's architect was JAMES CRAIG, a pupil of Sir ROBERT TAYLOR, who, towards the close of the eighteenth century, was considered to be the foremost architect in London. It is strange that no memorial of CRAIG is to be seen in the new Edinburgh of which he was the creator.

THOMAS HAMILTON, who erected the famous High School and was one of the foundation members of the Royal Scottish Academy, is the subject of another portrait. His contemporary, WILLIAM BURN, was a pupil of Sir ROBERT SMIRKE. He lived in Edinburgh for several years, but he returned to London, and up to his death in 1870 his practice was large. ROBERT ADAM is so closely connected with London he is generally supposed to have been an Englishman. But he was the son of the King's mason in Edinburgh, and the old Register House in that city is one of his works. It is represented in the exhibition by means of a model.

It was courageous on the part of Mr. RUSKIN to have condemned in the strongest words provided by his varied vocabulary the architecture of Edinburgh before an Edinburgh audience. One of his victims was W. H. PLAYFAIR, who was living in 1853. In "The Stones of Venice" he selects that architect's Free Church College as an example of the way in which buttresses were employed in modern times without any purpose, but merely because they were supposed to be a necessity of the style. In that particular example symmetry rather than strength dictated their use. PLAYFAIR, like many other northern architects—he was born in London—failed in Gothic, believing Classic alone was adapted for the northern Athens. However, his National Gallery, College of Surgeons, New College, Surgeons' Hall have long been accepted as creditable to Edinburgh. The view of his Donaldson's Hospital which is in the exhibition is interesting, because the colouring and the figures are by DAVID ROBERTS, R.A., who was once the scene-painter in the Edinburgh Theatre.

DAVID BRYCE was for a time a partner with WILLIAM BURN, and even in his last days he remained a dignified type of the old school. His Bank of Scotland is really a part of the Old Town, but there is no building in Edinburgh which has a more scenic effect when seen across the valley from Princes Street. His Fettes College and several country houses are grandiose examples of a style which was once in favour. The portrait of GEORGE M. KEMP recalls the enthusiastic joiner who designed the Scott memorial—a work which it is no exaggeration to say has been admired by people from all parts of the world, although the details show little respect for precedents. DAVID RHIND, the archi-

tect of Stewart's College, the Commercial Bank, &c., is another of the worthies who figure among the portraits. His designs prepared for the competition of the Houses of Parliament and the Government offices are shown.

Recently there was a scheme before the Town Council for the construction of a terrace in the Princes Street Gardens. It was not a novelty. Designs are shown which were prepared by Mr. J. DICK PEDDIE, M.P., for a similar alteration. The few statues of Scotsmen and the Scott memorial are enough to inspire a belief that a great many similar examples would be effective. But if the votes of visitors could be taken they would probably be in favour of allowing nature to prevail.

The drawings by living architects have been seen in various exhibitions. Sir R. ROWAND ANDERSON has a large array, including Mount Stuart House, Rothesay; the National Portrait Gallery, Edinburgh; the Central Station, Glasgow; the designs for the Montrose and Inglis memorials in St. Giles's Church, &c. In his treatment of classic elements he is more of a modern than were the architects of the earlier part of the last century. Mr. HIPPOLYTE J. BLANC, the president of the Association, shows the Coats Memorial Church, Paisley, and other works. Then there are the *Scotsman* Buildings, by Messrs. DUNN & FINDLAY; the North British Hotel, by Messrs. G. BEATTIE & SON; the Craig House Asylum and the Edinburgh University Union, by Messrs. SYDNEY MITCHELL & WILSON, and many other recent efforts. There are several drawings of the Old Town by JAMES HERON.

The Glasgow Corporation have sent a collection of drawings and photographs of buildings which have been erected in the western capital during the last half-century. By Sir GILBERT SCOTT is the Glasgow University. There are also views of the Municipal Buildings by the late WILLIAM YOUNG; St. Andrew's Halls by Messrs. DOUGLAS & STEVENSON and J. SELLARS. Among other works are the Clyde Trust offices by Mr. J. J. BURNET, the Stock Exchange and the Clydesdale Bank by the late JOHN BURNET. One of the churches by the late ALEXANDER THOMSON will excite interest. The *Daily Record* buildings are by Messrs. HONEYMAN & KEPPIE. The Parcel Post Office is by Mr. W. T. OLDRIEVE. The mansion-house, Rosehaugh, is by Mr. W. FLOCKHART. Among other architects represented are Mr. W. LEIPER, Mr. J. B. WILSON, Mr. MACGREGOR CHALMERS, Mr. J. A. CAMPBELL, Mr. G. S. AITKEN, Mr. A. M. PATTERSON and the late W. HEITON.

The architectural exhibition should be useful to architects as well as to the public. Those who practise the art must realise after seeing the drawings that Scotland has shown power in architecture as well as in painting. If greater independence of thought had been exercised there is no reason why a local style should not be developed by this time; or if the word "style" is objected to, then we can say local peculiarities. The old Scottish mansion had in it characteristics which could be turned to account, as was done by DAVID BRYCE, BURN, ROCHEAD and others. The public, that is to say Scotsmen, who have buildings to erect can convince themselves from the drawings that something else is practicable besides an imitation of what is produced in London, Paris or Holland. The words which were spoken by Mr. RUSKIN in Edinburgh over fifty years ago are worth remembering. He said:—"It is not by subscribing liberally for a large building once in forty years that you can call up architects and inspiration. It is only by active and sympathetic attention to the domestic and everyday work which is done for each of you that you can educate either yourselves to the feeling or your builders to the doing of what is truly great." In the old days there were obstacles to architectural advance. The clergy were all powerful, and they preferred to use buildings of a simple kind. When we are told that the Reverend WALTER BALCANQUHAL insisted on every window in Heriot's Hospital having different architraves and ornament we can realise the omnipotence against which architects had to struggle.

AHMEDJIE MOSQUE, CONSTANTINOPLE.

ON May 29, 1453, after a siege of about eight weeks, Constantinople surrendered to the Turkish forces of MOHAMMED II., and from that time has remained under the rule of Sultans. They were religious after a manner, and lost no time in arranging for the worship of the God of Battles. At first they had to use the numerous churches of the Christians, although the eastward position was not observed in the planning, while statues and mosaics were evils which they abhorred. The sculpture was removed, and the walls covered with plaster or whitewash wherever offensive pictures were seen. St. Sophia in that way was adapted to the Mohammedan ritual. In some cases the churches were demolished, and the materials rearranged to form mosques.

But the Sultans did not forget their obligation to raise temples which should not suggest mere temporary expedients. MOHAMMED II., although occupied in organising the new empire, erected as many as six mosques in the city. One was on a prominent site, and was designed by a Christian architect. But as the greater part of it succumbed to an earthquake in the eighteenth century, the reconstructed building which bears his name cannot be accepted as resembling the original.

BAYEZID II., the son of MOHAMMED II., also was a mosque builder, although his reign was troubled, and among his enemies were his brother and son.

SULEIMAN I., who is called the Magnificent by some and the Legislator by others, erected the noble building which bears his name. The principal dome is 86 feet in diameter, or about 20 feet less than that of St. Sophia. The lateral arches which sustain it are supported by great piers, partly of porphyry columns which once stood in the great open space known as the Atmeidan, which was the Hippodrome, and was one of the marvels of the ancient Byzantium.

There are several smaller domes forming a picturesque cluster, and there are four graceful minarets. SULEIMAN reigned for the long period of forty-six years, and died in 1566.

It is possible that AHMED I., who ascended the throne in 1603, was, as became a boy of fourteen, emulous of the fame of SULEIMAN I., and desirous to erect a more noble mosque. Among all in Constantinople it alone has six minarets, and is therefore called Alty-Minareli-Djami. According to tradition, the Imam of Mecca was so horrified when he heard of the proposed irreverence—for the Kaaba he guarded had only six—he went to the Sultan to remonstrate with him. The young AHMED could not deny his fault, which seemed likely to put an end to his project, but by a happy thought he proposed to add a seventh minaret to the Mecca shrine, towards which the thoughts of all true believers were then, as now, turned in devotional moods.

In another feature we can perceive a desire to compete with the Suleimanic mosque. SINAN, the architect of that building, arranged eight piers for the dome, and made each a solid structure in which the porphyry we have mentioned becomes only a partial facing. In the Ahmedjie, on the contrary, the dome and arches appear to have only the four massive columns, each about 20 feet in diameter, for support. They are the first objects which strike the visitor on entering, and from some positions near them the mosque appears larger than it is in reality. PUGIN, in the church he built adjoining his residence at Ramsgate, might have been thinking of AHMED's piers, for by means of a single massive pier the sight is momentarily deceived, and a chapel assumes the dignity of a church. If the pier were removed, and it has little use constructively, the general effect of the small building would be minimised. The columns in the Ahmedjie it will be seen are treated in a manner which recalls the Classic cabling, and by that means a multitude of

supports is suggested.

The deep band of verses from the Koran almost serves as a capital to each column. The columnar piers suggest that BURKE was right when he said that greatness of dimension is a requisite effect in building, and that a work of art may deceive in order to appear grand.

The building, it is believed, cost an enormous sum. As AHMED died in 1617, it is likely he did not witness the completion of his mosque. There are many parts of the building which are left plain, although elaborate decoration must have been contemplated. The windows which are filled with common glass also seem as if they were expedients which arose from the scarcity of money or the indifference of the new rulers. The immediate successors of AHMED were weaklings, who were not adapted for so perilous a position as representative of the Prophet, and they were followed by others in

whom cruelty predominated, and who preferred wars which could end in massacres.

If we remember the general condition of architecture in Europe at the beginning of the seventeenth century, we must wonder at the vigour and refinement of AHMED's mosque. The architect, whose name is not recorded, may have considered it essential for his central dome that the resistance on all sides should be equally balanced, and in consequence set out the plan as a square. The arrangement diminishes the interior effect, but as the four sides of SULEIMAN's mosque were not alike, the later building could be said to differ from it in a strict regard to uniformity. AHMED must have commanded clearances on an extensive scale in the Hippodrome area to provide ample room for his building, but the surrounding courts, with their cloisters and trees, form one of the most agreeable spots in Constantinople. The beautiful kiosque with its fountain is a marvel for its delicate arabesques, which become

COLUMNAR PIER, AHMEDJIE MOSQUE.

more remarkable when we recall the time in which they were produced. But the interior of the mosque is, of course, far more impressive, and the visitor, as Mr. RANSOM says, wonders whether he has not before him the largest columns ever constructed by man, and which by themselves are enough to immortalise the architect.

EQUESTRIAN STATUES.

THE custom was long accepted in this country which restricted the privilege of equestrian statues to memorials of a sovereign or of a royal prince. The departure from the custom was first permitted out of compliment to the great Duke of WELLINGTON. As a prince as well as commander of the forces for many years the statue of the late Duke of CAMBRIDGE, which was unveiled by His MAJESTY on Saturday, has therefore a double claim to attention. The late Duke was a man exceeding the average size, and Captain ADRIAN JONES suggests that historic fact by his treatment. Both horse and rider are reminiscent of the progress of a review, and both resemble living beings. The group is placed on a pedestal of Dartmoor granite designed by Mr. BELCHER, A.R.A.

FLAXMAN, in one of his lectures, accepted the statement of SPEED about the long period after the departure of the Romans in which the Britons continued to practise bronze casting. According to the antiquary:—"King CADWOLLO being buried in St. Martin's Church, near Ludgate, his image, great and terrible, triumphantly riding on horseback, artificially cast in brass, was placed on the western gate of the city, to the further fear and terror of the Saxons." Figures of horses, however humble in style, we can believe were always admired in this country; and no better way of indicating the greatness of a king could be devised than by representing him as a mounted commander. The statue may have been rude and, as FLAXMAN thought, became terrible from its execution. But it must be supposed it was a regular custom in England to model figures of kings on horseback. It may even be said that no variety of the sculptor's art is so inefficiently exemplified as that of equestrian groups.

The Greeks might be presumed to have bequeathed very numerous works of the kind. In the first place, by recognising centaurs as if they were real beings, and by endowing some of them with more than human cleverness, they were bound for the purposes of art to study the form of the horse with as much attention as they gave to a man or a woman. They had also another class of subjects—the Amazons—who required in order to be fully understood to have horses as companions. In an early period of the art we read of a group which represented a contest between HERCULES on foot and a mounted Amazon. SIMON OF ÆGINA was said to have gained renown by his bronze horses. It is also recorded that to celebrate a victory at Olympia a bronze car was produced drawn by four horses. Two life-size horses each attended by a groom served as another memorial of victory. The horses of CALAMIS were proverbial for their fidelity to nature. The perfection seen in the equestrian procession of the Parthenon and the centaurs of the metopes, which are now in the British Museum, could not have been so beautiful if many sculptors before PHIDIAS had not attempted similar subjects. Unfortunately the world does not possess a single example of the equestrians of the earlier periods.

We may presume that subsequently the number of those groups increased rather than diminished. Individuals were permitted to glorify themselves to an extent which would not be tolerated in a more primitive time. There can be no doubt that the Mausoleum was surmounted by a quadriga, and there may have been other examples. It was difficult for the Romans to have carried off numerous statues of deities and athletes. But an equestrian group, if it bore any resemblance to modern works, could only be transported with far more

trouble. In that way the absence of genuine Greek examples can be explained.

Mounted figures were well adapted for ostentatious Romans. If PLINY is to be believed, the sculptors were able to produce such works five centuries before our era, for he mentions one representing a Roman lady on a steed which was produced at that time. There are occasional references which suggest that equestrian statues were numerous in Rome. It is difficult to understand why so few have survived. The two great groups on Monte Cavallo, which formerly stood in front of the Temple of the Sun or the Baths of Constantine, are generally accepted as Greek rather than as Roman works. It is now believed they are only copies, and there is no certainty they were reproduced in Rome. They represent horse-tamers rather than equestrians. It can therefore be concluded that the figure of MARCUS AURELIUS is the only representative of a true equestrian statue which has survived, for the fragments of the ancient bronze horse in the Capitoline Museum leave it doubtful whether there was a rider. MICHEL ANGELO and others of the Renaissance sculptors regarded the horse which bears MARCUS AURELIUS as perfect. But FALCONET, the French sculptor, who measured all the parts and compared them with those of a living horse, considered the ancient work was an example which could only be produced at a time of decadence. The eyes, the nostrils, the mouth, the neck, the legs, were all declared to be defective. The horse, it was said, could not move in the way he is represented without a lesion of the antagonistic muscles. It is remarkable, however, that with all its shortcomings the emperor's horse has been admired for 1,700 years. One of the causes of the success of the group may be the merciful character of the rider, which is suggested by the placid countenance and the action of the hand, as if he were pardoning those who had opposed him. The figure of MARCUS AURELIUS is, however, when analysed found to have even more defects than the horse. Some critics have concluded that the work must have been produced by two sculptors.

Although during the Renaissance period there was a desire to rival the ancients in every kind of art of which they had left examples, there was a dearth of equestrian figures. In the famous letter which LEONARDO DA VINCI sent to LUDOVICO IL MORO in 1483 he wrote:—"I can likewise undertake the execution of the bronze horse, which is a monument that will be to the perpetual glory and immortal honour of my lord your father of happy memory and of the illustrious house of SFORZA." The artist is said to have completed the model, but it was of such dimensions it could not be cast, though whether from the want of materials or from defective arrangements in the foundry cannot be determined. The model was claimed to be more beautiful and majestic than any effort of a sculptor hitherto known, but the French troops made a target of it. DONATELLO was more fortunate, for he was able to bring to completion the equestrian statue which is the memorial of GATTAMELATA in Padua. But the arrangements were made by Venetians who were men of business. His pupil VERROCCHIO produced the better-known statue of COLLEONI in Venice which LEOPARDI cast.

Among modern works one of the most remarkable is FALCONET'S "Peter the Great" in St. Petersburg. It suggests the effort of the monarch to civilise his wild subjects, for he appears as if he had ascended a rocky eminence which was not free from serpents. The mass of rock had to be transported for some distance. PETER is clad in classic robes, and the horse stands on its two hind legs. But although suggestive of the circus, it appeared to be well adapted for a semi-barbarous country, and Frenchmen continue to be proud of it.

Another modern statue is RAUCH'S "Frederick the Great" in Berlin. The pedestal is adorned with several equestrian figures of warriors, and consists of two

tages, the upper having reliefs on each side. The last war with France has enabled German sculptors to produce several statues of the Emperor and his four principal lieutenants, who are generally represented as questrians. France of late years has not produced any equestrian figures, and there is not one of the first NAPOLEON in Paris. Jealousies will not allow that mode of representation unless the subject is JOAN OF ARC.

In England similar works are not numerous, and, as we said above, were long confined to royalty. The masterpiece among those showing men of lesser rank is undoubtedly ALFRED STEVENS'S "Wellington" in St. Paul's Cathedral, although it may be open to Dean MILMAN's objection that the Duke is riding into the cathedral on the top of his tomb. The late G. F. WATTS, in his Grosvenor Falconer and "Energy," has modelled massive figures, but it is open to doubt whether they should rank with the best examples of foreign sculptors. FOLEY in his "Hardinge" and "Outram" displayed a finer style.

HOLYROOD CHAPEL.

A CORRESPONDENT of the *Scotsman* has called attention to an address which the late Mr. W. W. Robertson, of the Board of Works, delivered to the Architectural Association, November 9, 1892, on the subject of "Our Duty in Respect of Ancient Buildings." In it the following passage occurs regarding the Chapel Royal, Holyrood:—

We have come to consider the thing, and we may as well pronounce now the baneful word "restoration" which have hesitated so long to introduce. This is the word which, like that inadvertently uttered at some magical scene of beauty and delight, may suddenly change the whole aspect of our gathering; this is the special danger to which consider old buildings are exposed in this century, but which I delayed to name. It is, indeed, a word of evil men, and we should have been very much richer this day if it had never been uttered, or if the ideas which it represents had never been applied to our ancient buildings. Here is, we do not deny, a certain fascination about the idea of restoring a ruined and desecrated building to its former noble proportions and richness of decoration, and most people are inclined to say that if the imagination is responsible for a few details, the piety of the intention and the excellence of the general result will cover less venial transgressions. There is no doubt that this is the popular idea of a becoming and respectful treatment of our old buildings; there is also no doubt that, since the beginning of this century, so-called restorations conducted in this spirit have wrought more havoc and destruction among our old buildings than any other single cause, or, it may well be, than all other causes combined. If this is so, it becomes the duty of everyone who realises it to raise his voice in warning and protest, and to do all in his power against the continuance of such destruction. The importance of this must be my excuse for trying your patience further on the subject.

Does anyone doubt that this is the popular view? If such I only knew how often, during the last ten or twelve years, I have had urged on me the desirability of restoring the Chapel Royal at Holyrood; restoring it, that is, in the sense of rebuilding all the missing parts, roofing it, glazing the windows and introducing the internal furnishings and decorations necessary to fit it once more for use as a chapel royal.

This example will do as well as another to enable us to realise what restoration of this sort actually means. The condition of the building, which is, of course, only a fragment of the old abbey church, is shortly this:—The aisle walls and the greater part of the west wall are still in existence. The east wall is the work of the sixteenth century. The whole of the nave arcade, and, of necessity, the triforium and clerestory on the north side are gone. On the south side the nave arcade and triforium remain, but in condition unfit to bear a superincumbent load, and the clerestory on this side also is gone; but I have often been told that there are sufficient remains to show what the whole must have been, and that is indeed so except in the case of the clerestory.

We are to build anew the missing portions. To begin with, there is the whole nave arcade, triforium and clere-

story on the north side. Those who are enamoured of this sort of restoration do not seem to realise that a thing once destroyed can never be restored. It is an utter and absolute impossibility. We may produce something more or less like it, but the thing itself we can never reproduce. When we have built anew this arcade and triforium and clerestory, and thus given one entire new side to the nave, do not let us suppose that we have restored the old work—it is our work, our piers and our arches, our shafts and our carving. In "The Old Curiosity Shop" the Marchioness assures Dick Swiveller that when she quaffed water in which orange peel had been steeped she could fancy it was wine if she made believe very much. But no amount of make-believe will enable us or anyone to suppose that these arches and piers are the old work. We know, and everyone knows, that the clerestory is our own, and mainly conjectural, and that the triforium and arcade below it are only more or less perfect copies of the old work opposite. Without doubt, as we have a genuine liking and regard for the old edifice, we have worked honestly, to the best of our ability and judgment, and the copies are really excellent copies, perfect copies we may say, or if not absolutely perfect, they are so in our present estimation; that is enough for us to-day, and for the present we are contented, if not happy, in what we have done.

Well, there our work stands, upright and handsome, staring out of countenance the weather-beaten and rickety old work opposite. In our secret soul we have a deep and honest affection for these venerable stones, and we would fain leave them untouched. But, what would you? We have begun the work of restoration; we must go on with it. The public would never endure that this beautiful new work, which is really excellent of its kind, should be confronted by these scarred and blackened and anything but perpendicular piers on the south side. The least that public opinion demands is that they be scraped and scrubbed and freed from the dirt of centuries, and brought into something like congruity with our handsome new work; and if this be done their lack of perpendicularity may perhaps be forgiven. Let us hasten to make a compact with the demon of restoration. In order to preserve these stones where the old builders placed them let us give up their surface to be cleaned and scraped as the restorer will. Alas! we have to build a clerestory and support a roof on these anything but vertical piers, and the laws of statics, which have no veneration for these old stones or for anything else in particular, declare that it cannot be done. We must now, as has indeed been seriously proposed to me in cold blood, take down this southern triforium and nave arcade and rebuild them so that we may have a safe substructure on which to erect our new clerestory and roof, a dreadful task for anyone who has the love of the old building at his heart. Now we begin to realise the grim truth which Ruskin has declared, that "the true meaning of restoration is destruction, the most total destruction that a building can suffer, a destruction out of which no remnants can be gathered," and that "more has been gleaned out of desolated Nineveh than out of rebuilt Milan."

I do not propose to carry our restoration of Holyrood Chapel further. I do not need to show how in this and in similar attempts to prepare a long-ruined building for occupation, even where entire rebuilding is not required, there is continual necessity for renewals which, in the aggregate, cannot fail to impair most seriously the genuineness of the fabric. We need but mention the weather-worn tracery which needs renewal before it can be glazed, the jambs and lintels which must be rebuilt, if not entirely renewed, before doors can be fitted to them; the parapets and wall heads which must be rebuilt before they can be trusted with a roof or have the gutters fairly fitted to them. These and similar points will occur to us all.

The Joint Educational Authorities of Bacup and Rawtenstall have decided to erect a secondary school at Waterfoot, which is situated midway between the two boroughs. The estimated cost is 25,000*l.*, and plans have been prepared for the approval of the Lancashire County Council.

Mr. Edward Milligan Beloe, F.S.A., of King's Lynn, who died on March 22, aged eighty, left property which has been sworn at the total value of 17,835*l.* After the death of his widow his executors may use their discretion in offering his collection of East Anglian maps, prints, prehistoric implements and other antiquarian objects to Norwich Museum by way of a gift, conditionally that they shall be preserved in their entirety and properly identified as his donation.

DUNDEE CHURCHES.

THE following report has been prepared for the Dundee Presbytery by Mr. Macgregor Chalmers, Glasgow, on the condition of the city churches:—

"In accordance with your remit, I visited Dundee on Tuesday, the 14th ult. I then learned that the Town Council of Dundee has had the decayed condition of the three city churches—St. Clement's, St. Mary's and St. Paul's—under consideration for many years. It was reported to the Council in 1888 that the cost of the necessary repairs on the churches would be 2,000*l.* Some years later the estimated cost was increased to 2,500*l.* The matter was again considered in the year 1905, when the cost was estimated under three heads, as follows:—(a) Cost of cleaning and pointing St. Clement's Church, and cleaning down and removing loose parts of St. Mary's and St. Paul's churches, 550*l.*; (b) cost of cleaning and pointing St. Clement's Church and repairing St. Mary's and St. Paul's churches with cement, 2,800*l.*; (c) cost of cleaning and pointing St. Clement's Church and thoroughly repairing and restoring with stone St. Mary's and St. Paul's churches, 7,500*l.* In the most recent report the cost of repairing the three churches is estimated at 4,500*l.* Of this sum 300*l.* is to be expended upon St. Clement's Church and 4,200*l.* upon St. Mary's and St. Paul's churches. All the decayed architectural features and walling of St. Mary's and St. Paul's are to be removed and replaced by new stone. The walls of St. Clement's are to be brushed down and the joints pointed. The Town Council have approved of this last report and estimate.

"When I read this report, I concluded that St. Clement's Church was in excellent repair, and that St. Mary's and St. Paul's were so dilapidated that it was necessary to spend on their repair a sum fourteen times larger than the sum to be expended upon St. Clement's Church. When the buildings were examined this conclusion was found to be erroneous. St. Paul's Church is sixty-three years old, St. Mary's Church is sixty-five years old, and it is said that St. Clement's is 119 years old. The external walls of St. Clement's Church have been built of a local sandstone of poor weathering quality. It is evident they have been in a dilapidated condition for many years. They are now hopelessly decayed. The works proposed are limited to pointing the open joints in the masonry and removing all the loose material still adhering, the effect of which will be to expose a fresh surface to the action of the weather. This will accelerate the disintegration of the stone. I think the report approved by the Town Council, so far as it refers to St. Clement's Church, practically admits its hopeless state of disrepair. I cannot recommend the acceptance of the expenditure of 300*l.* on its repair as a complete fulfilment of the Town Council's obligations as heritors. I think the time has come when the erection of a new church should be undertaken. I am of opinion from my study of the churches that the rebuilding of St. Clement's Church was in contemplation sixty-three years ago. The west end of the south wall of St. Paul's Church supports this view.

"The magnificent tower to the west end of St. Clement's Church was restored by the Town Council about thirty-five years ago at an expenditure of nearly 9,000*l.* It is unfortunate that a local sandstone of poor weathering quality was used in the restoration, as a considerable part of this new work is now decayed and calls for repair.

"St. Mary's and St. Paul's churches were also carefully examined. They are built of a local sandstone of poor weathering quality, and although they are little more than sixty years old, the architectural features are already broken and wasted by the weather. The base-course, the string-course, the cornice and cope of the side aisles, the intakes, niches and gables of the buttresses, the ornamental parapets and clerestory windows, the skews and pinnacles of the gables, the sills, jambs, mullions and arches of the windows, the jambs and arches of the doors, and a large proportion of the ashlar walling are broken and decayed. The report above referred to contemplates removing all these decayed and broken stones and replacing them with new stone. This work, especially the introduction of new sills into the great windows, will be difficult and very costly. As the stonework of the Victoria Hall built ten years ago on the north side of St. Mary's Church is already decayed, it may be well to avoid the use of local stone unless of guaranteed quality. There are many quarries from which reliable stone of suitable colour may be obtained. The stone from Alloa or from Wooler, in Northumberland, is of good quality. If the proposed works on St. Mary's and St. Paul's churches are carried out, the Town Council,

in my opinion, will have fulfilled their obligations as heritors (although I do not think that their proposals are the best in the circumstances). I feel sure that the masonry of the buildings will then remain in a fair state of repair for twenty-five years or more. The sum to be set apart for repair is a large one. If the work is carried out, not by contract, but by the Corporation directly employing the labour and paying for time and material, it is probably sufficient. But it is desirable that the Corporation should be left free to carry out the work in accordance with the specifications rather than in accordance with the estimate of the probable cost.

"I beg to report that in my opinion the Town Council proposals regarding the repair of St. Clement's Church are inadequate. I think it should now be rebuilt. I am of opinion that the Town Council's proposals regarding St. Mary's and St. Paul's churches are adequate, although, as have indicated, I believe that the interests of the city would be better served by following another course."

A copy of the report is to be sent to the Town Council.

NATIONAL PORTRAIT GALLERY.

THE trustees of the National Portrait Gallery call attention to the fact that the concluding meeting for the year 1906-7 marked the fiftieth anniversary of the first meeting of their Board, which took place on February 6, 1857, and the 270th meeting since that date. Of the Board of Trustees as at first constituted one member still survives—Lord Elcho, now Earl of Wemyss, who retired from the Board in 1866. The vacancy on the Board of Trustees caused by the death on April 13, 1906, of Mr. Richard Garnett, C.B., LL.D., has been filled by the appointment of Sir Thomas David Gibson-Carmichael, Bart.

The history of the National Portrait Gallery during the past fifty years has been one of continuous expansion within the Gallery and of public appreciation. At first housed in small apartments in Great George Street, Westminster, the collection on numbering 288 portraits was removed in 1869 to a gallery forming part of the exhibition buildings at South Kensington, where it remained until 1885, when in order to avoid risk of destruction by fire was removed temporarily to the Bethnal Green Museum. The number of portraits having increased during the sixteen years to 747. The collection remained at Bethnal Green for ten years, during which period the number of portraits was increased but slowly to 982. In 1895 the collection was transferred to the new gallery erected through the generosity of the late Mr. William Henry Alexander at St. Martin's Place and was reopened to the public in April 1896.

Since that date and during the past eleven years the public interest in the National Portrait Gallery has increased to a remarkable extent. The number of portraits on the register in the collection has increased to 1,460, exclusive of engravings, photographs and other portraits of a supplementary nature, which bring the total number of portraits actually exhibited to 1,630.

The rapid increase of the collection has for some time proved that the present gallery is quite inadequate for the purpose of displaying the collection in an orderly and intelligible arrangement, and the need for extension continues to become more urgent. The trustees have ascertained from the War Office that nothing can be done at present with reference to allotting any part of the site of St. George's Barracks for this much-needed extension of the gallery. The trustees can therefore only call public notice to the difficulties caused by the present congestion, and urge the Lords Commissioners of His Majesty's Treasury to give the matter their serious consideration.

Since the opening of the new building in 1896, in order to relieve the congested state of the galleries fifty-two portraits, mostly duplicates of persons represented in the gallery by better portraits, have now been transferred on loan to various public offices and collections with the approval of the Lords Commissioners of His Majesty's Treasury.

During the past fifty years the price of works of art of every description has continued to increase. The trustees have therefore great difficulty in obtaining portraits of any special value and historical interest, since the grant placed at their disposal in the annual estimates, which was amply sufficient fifty years ago, is now quite inadequate in the present state of competition. This difficulty moreover is one likely to increase in the future.

The collection has come to be regarded as a valuable factor in national education, and more than one foreign nation has expressed a desire that the example should be followed in their own country.

The donations, loans or bequests number 800. The latest additions are:—Richard Carlile, publisher, author and speaker, painter unknown; Robert Dodsley, poet, dramatist and bookseller, painted by W. Alcock; the Royal Academy in 1772, two sketches by J. Sanders, after J. Goffany, R.A.; Mary Anne Everett Green, historian and architect, drawn in chalks by her husband, George Pycroft Green; Samuel Johnson, LL.D., a study for the portrait at Knole, painted by Sir Joshua Reynolds, P.R.A.; Thomas, second Baron Lyttelton, an old copy after Thomas Gainsborough, R.A.; Samuel Cousins, R.A., mezzotint engraver, painted by James Leakey; Roundell Palmer, first Earl of Selborne, copy by Malcolm Stewart after the painting by Miss E. Busk; Gathorne Gathorne-Hardy, first Earl of Cranbrook, drawn in 1857 by George Richmond, R.A.; Charlotte Brontë (Mrs. Arthur Bell Nicholls), drawn in crayons in 1850 by George Richmond, R.A.; Sir Henry Irving, LL.D., 1838-1905, copy by L. Allen from the painting by Sir John Everett Millais, Bart., R.A.; Sir Patrick Grant, field-marshal, painted by E. J. Turner; William Thomas Best, organist and musical editor, bronze medallion, modelled by C. Prætorius; Sir W. G. G. V. Vernon Harcourt, statesman, original plaster cast from the model executed at Rome in 1899 by Waldo Story; Henry Peter, first Baron Brougham and Vaux, two pen-and-ink sketches by Charles H. Lear; a collection of twenty-eight portrait-sketches of artists, drawn in pencil in 1845-6 by Charles H. Lear.

Twelve portraits were purchased, viz. William Vincent, R.D., divine and geographer, drawn by Henry Edridge, R.A.; James Anthony Froude, historian, drawn in coloured chalks by J. E. Goodall; William Farren, actor, painted by Richard Rothwell, R.H.A.; Samuel Warren, Q.C., F.R.S., barrister and novelist, painter uncertain; Sir William W. Collett, K.C., sketch in oils by Sir Martin Archer Shee, P.R.A.; Edward Gibbon, the celebrated historian, painted by Henry Walton; Charlotte Brontë (Mrs. Arthur Bell Nicholls), painted in water-colours in 1850 and stated to be by "Paul" or Constantin Héger after an earlier portrait by her brother Branwell Brontë; Michael William Balfe, eminent musical composer, painted probably by Richard Rothwell, R.H.A.; Matthew Boulton, F.R.S., engineer, medallion-portrait executed in 1807 by S. Brown; John Constable, R.A., pencil drawing by Daniel Maclise, R.A.; Sir Thomas Goley, G.C.B., admiral, drawn by Henry Edridge, A.R.A.; Sir Charles Napier, K.C.B., admiral, painted by E. W. Gill.

GREEK TEMPLES.

THE cell of a Greek temple is a simple, oblong building. In the earlier periods it was probably nearly destitute of ornament, and except for the cornice, and for the smallness of the dimensions, much like a barn. Afterwards a porch was added, supported by columns, and the entablature began to receive some embellishment. Even this disposition, when the front came into view, was beautiful, and more so when an additional range of columns was added to the portico. Afterwards columns were added at the back also, which means the variety and contrast produced by them could catch the attention from every point of view. The next step was to continue the columns all round. The temple cell had no particular appellation, and yet from the great multitude of temples existing in ancient Greece, many of which seem to have been very small, it is probable they were not uncommon. Temples of the second sort were said to be in *antis*, because in them the flank walls were prolonged beyond the front so as to form the sides of the porch, and these prolongations were terminated in pilasters having three faces, which pilasters were called *antæ*. The third arrangement was called *prostyle*, the fourth *amphiprostyle*, the fifth *peripteral*. Besides these were also the *pteral* temples, having two rows of columns round the cell, and *pseudodipteral*, which differed from the *dipteral* by the want of the inner range of columns, and from the *peripteral* by having a much larger space between the cell and the surrounding colonnade. In all these the same general form was preserved, a simple oblong, and the admiration bestowed upon them was owing to the simplicity of form and richness of detail. This richness of detail has its limits, and the work may be overloaded, even when the ornaments do not (as they frequently do in Italian architecture) interrupt or obscure the simplicity of

the design, but the liberty allowed is very wide. The simple cell must always have been deficient in that respect, for though the walls and cornices might be richly ornamented, yet these details could not have produced sufficient effect on the whole composition; for that purpose it is necessary that the building should be divided into principal masses, whose position with respect to each other must produce some degree of variety and intricacy. The temple in *antis* must also in some degree be deficient in richness, and no temple of this sort has been much admired; but the *prostyle*, and still more the *amphiprostyle*, if well proportioned, will always be admitted into the rank of beautiful buildings. From almost every point of view we see at least one column gracefully detaching itself from the mass of the building, and the nakedness of the side walls contrasts with the bright lights and shadows of the ends, and claims our admiration even when compared with the higher finish of the *peripteral* temple. The eye, however, will not be satisfied with some intricacy in the disposition of the general masses; it will require a similar gratification when it comes to examine the details; and we find this accomplished by fluting the columns, moulding the capitals, dividing the frieze at least by triglyphs and frequently placing sculpture in the intervals between them; adorning the pediments with sculpture, and placing *antefixæ*, or ornamental convex tiles along the eaves. The ancients used two sorts of tiles in covering each building: the first were flat, but turned up at the edges; they were trays with the ends cut off, made a little smaller at one end than at the other, that they might lap one into the other, but if such tiles were simply laid side by side the water would run in between them, and to prevent this other semicircular or semipolygonal, *i.e.* convex, tiles were placed over the joint. These tiles ran in ribs, from the ridge of the roof down to the eaves, and the last of them at the eaves had an elevated and ornamented end, and the range of these ornamented ends, which in the edifices of Athens were of white marble running above the cornice, greatly enhanced the appearance of splendour, and must have had considerable influence even on the distant appearance of the building. In temples of the Ionic and Corinthian orders the richness of decoration was carried still further, though there was by no means the difference between those and a highly finished Doric temple which might at first be imagined. However, between a Doric *prostyle* temple and a *dipteral* temple of the Corinthian order the distance is immense, yet each has peculiar beauties, and he who prefers the one has no right to reproach with want of taste him who approves the other.

GLASGOW SCHOOL OF ART.

THE Governors of the Glasgow School of Art, authorised by the Scotch Education Department, have granted five maintenance scholarships of 20*l.* each with free tuition, and seven travelling bursaries of 10*l.* each. Maintenance scholars:—Drawing and painting—Alex. L. Jackson, Robert C. Robertson. Architecture—Wm. J. Anderson. Modelling—John Currie. Design and decorative art—Florence M. Lee. Travelling bursars:—Drawing and painting—John Mills, John M. Purvis. Architecture—Wm. Friskin, Chas. A. Harding (divided), David M'A. Carlile (divided). Modelling—Wm. R. Dick. Design and decorative art—Eliz. G. E. Dobson, Robert Hood. Twelve governors' day class studentships and thirty governors evening-class studentships were awarded. The Institute of Architects' prize—Richard M. M. Gunn. Medallions presented by Mr. Chas. E. Whitelaw, F.S.A., architect:—Wm. J. Anderson, silver medallion; Alex. T. Scott, bronze medallion; Richard M. M. Gunn, special book prize. Anatomy—Alex. Gordon. Messrs. Wm. Meikle & Sons for stained glass—James S. Rennie. Day and evening bursaries offered by the Haldane Trust tenable at the Glasgow School of Art—the judges for these were Mr. Alex. N. Paterson and Mr. John Henderson. Day-class bursaries, value 15*l.* each—Charles Aird, Wm. B. F. Williamson, Ellison J. F. Young, Clara C. Tucker. Seventy evening-class studentships. "Robert Hart" Bursaries for drawing and painting, value 10*l.*, awarded by the "Robert Hart" Trustees upon the judges' report.

The Association of Municipal Corporations has decided to approach the Prime Minister and Mr. John Burns with a request that they will receive a deputation from the Association on the subject of the planning of suburbs of populous centres.

NOTES AND COMMENTS.

THE next meeting of the Royal Society of Antiquaries of Ireland is to be held in Athlone, and will commence on July 2. The town is the central point of Ireland, and in consequence its possession was sought in the contest between JAMES II. and WILLIAM III. According to MACAULAY, "ROSEN, who understood war well, had always maintained that it was there that the Irishry would, with most advantage, make a stand against the Englishry." When GINKELL was able to seize on the town, the Jacobite commander was forced to retreat and the end of the war could have been foreseen. The members of the Society will be able to visit the castle and other places associated with the siege. There will be excursions to Lough Rea (in the small islands of which are several ruins); but still more interesting will be Clonmacnois, where there are remains of the "Seven Churches," two round towers, three crosses, the nuns' chapel, the castle and about 200 inscribed slabs and fragments, with inscriptions in the Irish language. The abbey and castle of Roscommon will also be visited. Papers will be read on "The First Norman Castle of Athlone," "Clonmacnois," "Holy Wells in Ireland" and "The Burke Effigy at Glinsk."

A COMPETITION in which many Scottish architects will be glad to take part is that for municipal buildings in Stirling. The first part of the project will only be carried out at present, for the amount to be expended is limited to 12,000*l.* It will include Council chambers and offices for town clerk, chamberlain, collector, master of works and sanitary inspector, accommodation for caretaker and muniment-room. The second part will include School Board offices, police offices, corn exchange, fire station, workshops, &c. The premiums offered are not in keeping with the importance of the competition, for they amount to 50*l.*, 30*l.* and 20*l.* A competent assessor has been selected in Mr. WILLIAM LEIPER, R.S.A., of Glasgow. It is to be hoped that local characteristics will be respected by the competitors.

THE battle between town and country seems to be endless, for when it is over in one place it breaks out elsewhere. "No man made the land" is a maxim in political economy, but a great many are taxed to pay those who claim as much right to it as if they were its creators. The House of Lords insisted that there must be some abatement of the claims to ownership of light and air, for otherwise towns would be an impossibility. Something of the same kind is required in connection with the sanitation and water supply of towns, for every improvement which requires some of the land which nobody made is met with opposition and claims which are out of proportion to the interference which was necessary. A case of this class came before Mr. Justice JOYCE a few days ago. The Corporation of Halifax in carrying out works for a water supply found there was a leak in the bank of a reservoir, and in order to stop it they had to form a heading at a depth of 123 feet below the ground. In the search for the defect it was necessary to proceed for 42 feet beyond the Corporation property. The owners of the land sought an order from the Court not only for the removal of the works which were necessary, but to remove the concrete and whatever was introduced to prevent leakage. In theory it is true a landowner can claim the possession of a part of the earth beneath his land, probably beyond the centre of the globe. In the same way he can claim authority over light and air for a distance which it is difficult to realise. It could not be alleged that either the appearance or fertility of the 42 feet of ground suffered by the heading. But a trespass had been committed, and that used to be considered a very serious affair. Fortunately some judges are now disposed to recognise mutual rights, not as of equal force, but as

allowing of an extenuation of technical trespass. Lord Justice SMITH a few years ago laid it down "that (1) if the injury to the plaintiff's legal rights is small (2) and is one which is capable of being estimated in money, (3) and is one which can be adequately compensated by a small money payment, (4) and the case is one in which it would be oppressive to the defendant to grant an injunction, then damages in substitution for an injunction may be given." Mr. Justice JOYCE wisely adopted that rule, and decided that the plaintiffs should have no more than the 100*l.* which the Corporation had offered. As they are not to obtain costs the owners have lost by their suit.

THE Engineering Standards Committee have found it necessary to make alterations in the standard specification for Portland cement. The following may be mentioned among the more important points in which revisions have taken place:—1. The percentage of sulphuric anhydride has been slightly raised. 2. The quantity of cement to be used in the test for fineness and the period for which it is to be sifted have been specified, while the residue to be left on a sieve 180 by 180 has been somewhat reduced. 3. The grading for the increase of tensile strength in the neat test has been further extended. 4. The maximum final setting time for the "slow-setting" cement has been increased. 5. The expansion under the Le Chatelier test has been reduced. The sectional committee are also making experiments with a view to the inclusion of a clause as to initial setting time and other subjects. Considering the quantity of cement which is produced in this country we think the committee should be chary about introducing alterations. It must be remembered also that cement manufacture has created many foreign rivals, and it will not be difficult for them to declare that their product is in keeping with the second standard if not with the first. Experiments should be encouraged but if the Standards Committee amuse themselves by pottering with materials they are likely to seriously interfere with business.

FRICTION arose when in October last the Tribunal of Appeal decided that the London County Council should pay 110*l.* costs, having failed in respect of the appeal against the certificate of the superintending architect defining the general lines of buildings in Euston Road and Cleveland Street. The Tribunal having stated a case for the opinion of the High Court, the matter came on for hearing on May 14, before Mr. Justice PHILLIMORE and Mr. Justice BRAY. The Court held that when the Council made itself a party in an appeal case it had a right to obtain costs and had a corresponding liability to pay costs in cases where the Tribunal so thought fit, and that such being the case the Tribunal of Appeal had jurisdiction to order the costs in question to be paid by the Council to the appellants, and the Court affirmed the order of the Tribunal with costs. The Building Act committee have advised the Council to accept their lordships' decision. It is an important conclusion, for it upholds the independence of the Tribunal of Appeal, and also proves that the London County Council can be considered as an ordinary litigant without any special privileges.

LESSONS FROM SAN FRANCISCO.

WE have received the following communication from the Government of the United States (Geological Survey) for publication, as it is believed the information contained in it is of universal interest and importance:—

Unless future earthquakes are very much more severe than any that have occurred, there is no reason why San Francisco should not be rebuilt as a successful commercial enterprise. It seems highly improbable that earthquakes will ever be much more severe than the one of April 18, 1906. There is no doubt that the city can be rebuilt, so that although it may suffer damage from future earthquakes, this damage will not be at all fatal, and the city will not burn up as the result of it.—JOHN STEPHEN SEWELL, captain, Engineer Corps, U.S.A.

When we can plainly see as we may, looking backward, that nearly all of this destruction and suffering might have been prevented by wise foresight and provision, we feel that we must send a warning to all the cities of the world. Any city that disregards this warning will be guilty of a great crime.—FRANK SOULÉ, Dean College of Civil Engineering, University of California.

The San Francisco disaster demonstrated that the lessons taught by the Chicago and Baltimore fires are still unlearned. The same faults in construction continue to be repeated. The only sure way to remedy grave defects of this character is to enact strict building laws which will compel an observance of the essentials for fireproof structures.—RICHARD L. HUMPHREY, Secretary of the National Advisory Board on Fuels and Structural Materials, and Expert-in-Charge of the Structural Materials Division of the Geological Survey.

In the above words, three of the best-known experts on structural materials in the United States sum up the hopeful yet practical lesson that has been learned from the terrible disaster that cost 500 lives and a property loss of 500,000,000 dols.

Acting in co-operation with the technologic branch of the Geological Survey, these experts visited the scene of desolation and ruin wrought by the earthquake and fire shortly after the catastrophe. Captain Sewell officially represented the War Department at the time; Professor Frank Soulé was acting on behalf of the Geological Survey, and Richard L. Humphrey, now expert in charge of the structural materials division of the Survey was on the ground representing the national advisory board on fuels and structural materials.

Their reports tell San Francisco and other cities of the world how to be prepared for earthquakes and also how to prevent general conflagrations. The experts find much carelessness in building methods, not only in San Francisco, but also throughout the entire country.

That reinforced concrete structures properly built are the best, not only to withstand earthquake shocks, but also against fire, is the opinion of these experts.

The conclusions of Captain Sewell in regard to the most efficient type of building for San Francisco contain some striking suggestions.

"For very tall buildings," says Captain Sewell, "the best type of construction is undoubtedly a steel frame, but it should be thoroughly braced, much in the same way as the Call Building. The steel bracing in this building undoubtedly saved the masonry. In buildings such as the New Chronicle and the Monadnock, the effect of the vibration was really counteracted by the masonry, and the masonry was much shattered. Some of it was precipitated into the street from the New Chronicle, the Rialto and other buildings. Naked steel frames of the same type came through without serious damage, but they did not have the additional stresses due to the vibration of a great load of masonry floor construction and content in the upper storeys as did the finished buildings.

"It is not right to run the risk of precipitating the masonry into the streets on the heads of passers-by, as might have happened in the case of the unbraced steel-frame buildings had the earthquake occurred at a later hour in the day. Besides, if the bracing is dependent upon masonry which is seriously shattered by the stress it is expected to resist, the factor of safety against general collapse is manifestly too small. The steel-frame construction should therefore be thoroughly braced.

"In my judgment, to secure best results, it should also be enclosed with walls of reinforced concrete, in which case it would be almost impossible to throw the walls off. The proper artistic treatment of this material would seem to be a very important problem for the architects in a place like San Francisco. Its great utility in earthquake shocks cannot be denied. Where steel-frame buildings are to be finished with ordinary masonry walls, however, complete bonding of all face bricks with full header-courses should be absolutely required; no other form is adequate. Nothing

but Portland cement should be allowed in any portion of the structure. The masonry should be tied to the steel frame in the very best possible way, and much more securely than is ordinarily the case.

"For buildings of moderate height, say up to 125 feet as an extreme limit, reinforced concrete alone can undoubtedly be so designed as to give very good results when subjected to either earthquake or fire. But the bracing of a reinforced concrete building of any height to resist earthquakes is a matter for serious study.

"Any building of considerable height in an earthquake country should have as little mass in the superstructure as possible, consistent with other necessary qualities. But this limiting of mass does not mean that the flimsy floors and partitions heretofore in use should be continued. In fact, to make the buildings proof against both earthquake and fire, it is probable that they will have to be at least as heavy as they have been, but changes in distribution of the mass could advantageously be made, and would be made by any careful and skilful designer.

"For the ordinary commercial building, where brick walls and wooden joists would ordinarily be used, I am of the opinion that reinforced concrete is the safest and most practicable solution in a place like San Francisco.

"Where reinforced concrete is used throughout, whether the building is very tall or not, great care should be taken with the design and execution of the connections between columns and members of the floor system.

"From the effect on fortifications and from the effect on monolithic and massive concrete structures elsewhere, it seems justifiable to conclude that a solid monolithic concrete structure of any sort is secure against damage in an earthquake country, unless it should happen to lie across the line of the slip. In that case the damage might be fatal and it might not. That would depend altogether upon the amount of the slip and the intensity of the forces accompanying it."

Professor Frank Soulé declares in his report that the failure of some of the methods of fireproofing in San Francisco is directly traceable to the commands of owners to their architects to cheapen, as far as practicable, the fireproofing and the construction generally, in order to secure greater interest on their investment. "This cheapening," he declares, "has often occurred in spite of the protests of the designer, and it is in an entirely wrong direction, for rates of insurance are largely reduced with improvements in fireproofing; and as the cost of the steel frame and its proper fireproofing seldom exceeds 27 per cent. of the cost of the building, it seems wise to protect the other 73 per cent. with adequate materials."

On the best types of buildings for San Francisco, Professor Soulé says:—"In a country subject to earthquakes a strongly-framed and well-founded wooden house of two or at most of three storeys in height, with non-disintegrating plaster and finish, light tile chimneys and ample fire prevention and protection would seem to be the ideal type of residence structures.

"The high, steel-frame office buildings have shown that in order to resist perfectly the bending moments and shears induced by the swaying due to the earthquake movement, such buildings should be stiffened in their joints and connections by the best rivetting combinations and knee and other bracing, particularly at or near the ground floor. This requirement is of the utmost importance, and so also is the one that the swaying referred to should be diminished by the liberal introduction of diagonal and wind bracing throughout. The proper bracing in the lower storeys has sometimes been omitted upon the demand of owner or lessee to afford more glass or light space, but such design has a weakening effect and should be discouraged.

"Columns, exterior and interior, should be put in more liberally in future upon the first and second storeys, and the strongest joints and connections should be adopted in order to resist the bending and shearing. These improvements will greatly stiffen the steel frame and prevent the cracking of the walls.

"With such strengthening the high steel structures will safely endure an earthquake of even greater severity than that of April 18. This kind of building has proved its worth and has come to stay. It has been tried, and has not been found greatly wanting. Minor improvements, as advocated, will produce a perfect structure.

"In another class are to be placed, but not as failures, concrete and reinforced concrete structures. These structures have become popular for construction with a large number of designers in San Francisco on account of the claimed strength, indestructibility, facility of use and fire

and rust protection their materials afford. Unfortunately for San Francisco, there were very few structures of concrete or reinforced concrete in the city at the time of her great trial, but these few behaved well during both the earthquake and the resulting fire.

"Therefore, although such structures are admittedly new and comparatively experimental on the Pacific Coast, the confidence reposed in them has already led to the designing of a number of large buildings of this type for public or business purposes. At present the sentiment is to limit them to a height of six or eight storeys on account of their experimental character, and because of the fear that greater height would permit a reversal of stress due to quake and wind force in the reinforced girders. It is agreed that the columns should be reinforced with steel and braced together whenever possible, and that the girders should be similarly reinforced for tension and shear, and made, as far as practicable, continuous over the columns; and also that the joints and connections should be strongly stiffened and the curtain walls strengthened by reinforcement.

"Mill construction with brick will undoubtedly be used in many instances for a considerable time to come, but the lesson taught us should be learned that the materials should be first-class pressed brick, well wetted, and cement mortar, and that all parts should be thoroughly tied and anchored together. This rule has been found by our experience to be a most important one to follow in all brick and stone construction, and its neglect in the past has resulted in much loss and ruin."

Mr. Richard L. Humphrey, the third expert, sums up his visit to the ruined city with the following:—"Large conflagrations demonstrate that there is no such thing as a fireproof building. To label one as such is bad practice, since it gives a false sense of security and causes a relaxing of necessary precautions."

Continuing, Mr. Humphrey says:—"The preparation of the new building code is also operating against the best interests of the city. The arbitrary classification is one which will result in more harm than good. The efforts of those interested in its preparation are directed largely to office and other large buildings, apparently not realising that the great percentage of reconstruction will consist of small three or four storey buildings.

"Because a structure is built of steel and fireproof does not make it superior to other types of construction, for poor materials and workmanship may produce one of inferior quality.

"The proposed code discriminates against reinforced concrete buildings in designating them as class B structures. While not intentional, this conveys the impression that it is next in order of superiority to class A structures. Class A should embrace buildings so well designed and constructed of first-class materials that they afford the maximum resistance to fire, and should represent the best method of fireproof construction regardless of type.

"The loss of life from earthquakes is usually very great. That in San Francisco it did not exceed 500 is accounted for by the fact that at the time of its occurrence during the early hours of the morning most of the inhabitants were in houses 90 per cent. of which were of frame. This type of structure withstood the earthquake shock particularly well, which accounts for the minimum loss of life.

"Had the earthquake occurred four or five hours later, when the people were performing their daily tasks in offices, schools, &c., or on the streets, the loss of life must have been very great.

"The lessons taught by the great calamities such as have befallen San Francisco, Baltimore, Chicago and other cities are not regarded. It is quite probable that the new San Francisco will be, to a large extent, a duplicate of the former city in previous defects of construction. The defects of construction which are so strongly condemned by reason of their failure are no worse than those generally practised throughout the United States. The same defects are common, and it is evident that the same result would follow an earthquake of equal intensity in another part of the country. A moment's consideration will show that the loss of life and property in New York, for example, under similar conditions would be enormous.

"The damage to property in San Francisco is estimated at 500,000,000 dols., but this sum, large as it is, is exceeded by the total annual expenditures for new construction in New York.

"In three days the tremendous area of over 2,593 acres was burned, destroying entirely 490 city blocks and in part

thirty-two blocks. Of this 314 acres comprised the congested district on which there was 250,000,000 dols. insurance, probably representing a value of at least 500,000,000 dols.

"In the Baltimore fire 1,343 buildings were destroyed, having an assessed value of 12,908,300 dols. In two years these burned buildings were replaced by 570 buildings, whose assessed value is 20,000,000 dols. These new buildings are larger than the old, and the widening of the streets has eliminated 700 building lots. It is expected that when the reconstruction within the burned district is complete, there will be less than 800 buildings, of which the assessed value will be fully 25,000,000 dols.

"It is, therefore, quite reasonable to suppose that the assessed value of the new San Francisco will at least be double than at the time of the catastrophe."

The experts offer still another suggestion to San Francisco which seeks to safeguard the people against a conflagration. In discussing the waterworks system, Captain Sewell says:—

"In a city subject to earthquakes it seems practically impossible to suggest any method of construction which will make the mains and distributing pipes in all cases perfectly secure. In my judgment the only remedy is to have a large storage capacity within the city itself, distributed among various reservoirs, and to have a more than ordinarily complete gridiron of mains with gate valves arranged to cut out any main at every intersection; further, the mains should be larger than would ordinarily be required, so that if a portion of the gridiron were shattered it could be cut out, but the water brought in undiminished quantities to the perimeter of the shattered area from all undamaged parts of the gridiron. The mains should be so large that although the water would have further to travel, in this case there would be an adequate supply for fighting fire, if necessary, in the area where the mains were shattered.

"It would seem that in a city like San Francisco a special system of high-pressure salt-water mains, supplied from a pumping-station, would be the best solution of the fire-fighting question so far as the congested district is concerned. This plan has been recommended by the National Board of Fire Underwriters, and it is probably the wisest one under the circumstances. The pumping-station should, of course, be protected from earthquake damage in every possible way. Possibly it should be a floating station. The salt-water mains should be laid out and so interconnected that nothing short of general destruction of the entire system could wholly shut off the water from any considerable area. All of this means greatly increased expense in the distributing system, but in a situation such as that in San Francisco it seems to be required.

"The earthquake effects at San Francisco also indicate quite clearly that a special study should be made of the problem of the prompt execution of emergency repairs for the damaged conduits and mains.

"In the case of salt-water fire mains in a city like San Francisco, where there is practically no damage from freezing, it would seem worth while to run the mains exposed everywhere. If breaks occurred it would then be possible to repair them in time to prevent any general destruction of the city by fire."

Professor Soulé, in taking up the question of waterworks, says:—

"San Francisco should have had separate and ample water mains, entering the city on several independent lines from different sources of supply; numerous distributing reservoirs on her hills in various parts of the city, always well filled, independent and yet with a distributing system meshing the entire area with its pipes, so joined or valved that they might be separated or united at will.

"There should have been, in a city almost surrounded by salt water, a separate system of flexible salt-water mains for fire and sewer purposes, and numerous large cisterns in her streets, laid in reinforced concrete, with somewhat flexible lining and pipes. These cisterns, only a few blocks apart, should have been always filled with salt water.

"There should have been many wide streets like Van Ness Avenue, where the fire was finally checked, and many large squares, thus dividing the city into many fire districts.

"The fire department should have included a dynamite corps, of experienced fire-fighters, and a number of fire-boats always ready along the water front and among the shipping. None of these things did we have. With them probably this story of the greatest fire in history would never have been written."

The experts pay considerable attention to the proper fireproofing of buildings, one making the remark, "The protection of external openings is by all odds the most important constructive problem involved in the effort to make cities proof against conflagrations."

Says Soulé:—"Of a building's entire fire damage, the risk from fire within the building is estimated, on the average, at 40 per cent., the other 60 per cent. of the risk being from fires exterior to the building. This risk for interior fires should be reduced to a minimum by ample provision for fire protection. As far as practicable, the absence of combustible material should be secured."

"Several of the so-called fireproof buildings in San Francisco were injured chiefly by the burning of their wooden trim, floors, doors, rugs, &c. Wooden floors have proven to be dangerous and objectionable; but in some instances non-combustible wood may be used for them and for the interior trim, as, for example, when the heat could never be very great. Metal trim, doors, window sash and castings, together with plate glass, or better, wire glass, may confine a fire to a single room, preventing a general combustion."

"Adequate fire-extinguishing apparatus—such as fire-hose, always connected with good water pressure, wells with automatic pumps, and tanks in the basement or filled tanks upon the roof, with pipe connections—was lacking in nearly all of San Francisco's buildings, even in those of the highest class."

"In the case of the California Electric Company's building the stand pipes with attached hose, the well, pump and tank in the basement, and the roof tank, together with the metal sash and the wire-glass windows, prove the value of such a private system, saving that property from the hot fire around it when every adjacent structure was burned. As this building was not fireproof the value of the fire-extinguishing system can be well understood, and had all of our large establishments been equally equipped the conflagration would have been quickly checked and a vast amount of property saved."

"While the danger from exterior fires to a given building is ordinarily estimated at 60 per cent., it practically becomes 100 per cent., of course, in case of a great conflagration."

"In San Francisco little protection from exterior fires had been adopted. There were few metal shutters or steel roller shutters, and those were usually of imperfect design, that proved unsatisfactory when tested. The openings in walls were fatal points of weakness in all of the great buildings. Wire-glass windows, though few in number, behaved well, but wooden instead of metal sashes were great sources of fiery contagion. Metal covering over wooden doors and window frames was generally inefficient. Ordinary glass was quickly cracked by heat from the exterior; the sashes took fire and the flames rushed in through the openings, consuming all combustibles within. Many of the best buildings were gutted in this manner. Had they been furnished with metallic shutters of the best design, with wire-glass in metal sashes, and with cornice and other exterior sprinklers supplied by a private water-plant, they certainly might have been saved."

"San Francisco's experience recommends that wells and elevator shafts running up through many storeys should be guarded by brick or reinforced concrete walls, fitted with double metal rolling doors bolted to the walls to allow for expansion, or with automatic sliding doors and wire-glass partitions. There was little or no provision for cutting off the draught of air that will ascend through such a shaft during a fire, and great destruction resulted in consequence."

"The Call building took fire by drawing the heat from the power-house behind it on the other side of Stevenson Street through the tunnel to the elevator shaft, up which it rushed with the fierce draught given by the eighteen storeys, breaking glass and burning doors, furniture, trimmings and office contents."

"The importance and value of real protection will be appreciated when it is stated that a third-class building with such complete fire-protection plant is insured for less than a first-class one not having it. This lesson is one that should be taught to all capitalist owners by their architects and engineers. Moreover, all parts of an establishment should be equally protected, for the fire may begin anywhere. The new Telephone building was burned owing to the non-observance of this rule, catching fire through the unprotected wooden back door of the basement."

"Capitalists and owners must understand that perfect fire protection for structural steel is necessarily expensive."

Any so-called fireproofing that is cheap and flimsy is a delusion and will not serve. The application of an effective method insures permanence of the structure, and at the same time is a great reducer of the rates of insurance."

"Steel columns may be well fireproofed by surrounding them with 4 inches of the best quality of stone or cinder concrete, or by 3 inches of either when hollow tiling is put upon the exterior."

"Fire-walls of brick extending up above the roofs of buildings were effective in resisting the spread of the fire, but the support derived from metal bands and anchors was often neglected, like much other masonry, in San Francisco, and such walls therefore fell in many instances both during the earthquake and fire, particularly when laid in common mortar."

"Cast-iron columns in many buildings endured the quake and the fire quite well, but undoubtedly would have been broken or shattered had cold water been thrown upon them in the midst of the great heat. They should no longer be used."

"Chemical fire extinguishers were effectively used immediately after the earthquake in some of the up-town residences, thereby preventing an increase in the number of fire centres in the beginning of the conflagration. It is possible that numerous chemical engines and locally installed chemical extinguishing plants in the down-town districts might have greatly limited the spread of the flames, despite the dearth of water at the commencement of the fires."

Captain Sewell's conclusions on fireproofing are equally interesting. He says:—"The Baltimore fire and the San Francisco fire, as well as many other fires and fire tests, have proven quite conclusively that commercial methods of fireproofing are inadequate to stand any real test. In the majority of cases the steelwork is fairly well protected, but the number of failures is sufficiently great to show that the factor of safety against fire is not by any means what it should be."

"In my judgment, columns should be covered either with 4 inches of brickwork laid in Portland cement mortar, and with all the interior spaces filled with concrete, or else they should be enclosed in an expanded metal basket and the entire interior filled with concrete so that the minimum thickness of the concrete shall not in any case be less than 4 inches."

"The furred ceilings so much used in San Francisco are a valuable addition to the fire-resisting qualities of the floor construction, and if the furring rods were more firmly secured the total loss here, as a rule, would be measured by the value of the plaster alone."

"The results at Baltimore and San Francisco did not by any means indicate that either hollow tile or concrete is altogether a failure or altogether a success. Both fires indicated very clearly that commercial methods of applying both materials are inadequate; both also indicated very clearly that successful results can be attained with both materials."

"A conflagration never yields reliable comparative results, but from such comparative results as are available I think there is no question that the best fire-resisting material available at the present time is the right kind of burned clay."

"As for concrete, there can be no question that good clinker concrete made of well-burned clinkers, Portland cement and sand, is a very efficient fire-resisting material. It is better than anything except the better types of burned clay products, but the form in which cinder concrete is commercially applied is on the whole no better than the flimsy hollow tilework with which it competes; in fact, it is not certain that it may not be worse."

"While there is no doubt that commercial standards of fireproofing are dangerously inadequate, the greatest trouble of all is the fact that so little attention is paid to protecting the exterior openings in a building. Even a very inefficient type of fire shutter would probably have saved some of the buildings in San Francisco, which were, as a matter of fact, burned out. A light metal shutter, combined with a window sprinkler, would probably resist quite a fierce fire for a long time. While the failure of the water supply in San Francisco might be urged as one reason why a window sprinkler would have been of no avail, it is a fact that water can be obtained by driving wells into the sand which underlies the business part of San Francisco almost everywhere. Under these circumstances, if the fireproof buildings had been fitted with metal shutters, each window provided with a sprinkler and the buildings themselves with

their own wells and fire-pumps, it is probable that the fire could have been kept out of a number of the buildings. The protection of external openings is by all odds the most important constructive problem involved in the effort to make cities proof against conflagration. It would seem that the question of so-called fireproof vaults in commercial office buildings should also receive some attention. The failure of such vaults in San Francisco was absolutely inexcusable. The fact that they were such flimsy affairs as they were was not due to any lack of knowledge available as to how a fireproof vault should be built; the only motive that can be imagined for the erection of such vaults is parsimonious and criminal economy."

The reports of the three engineers show that, as a rule, the amount of damage to buildings in San Francisco varied according to the character of the materials and the class of workmanship. Buildings constructed of first-class materials with careful workmanship suffered much less than those constructed of poor materials with inferior workmanship. This fact should be a lesson to owners, engineers and architects in all parts of the country.

In spite of the lessons taught by great conflagrations, it is to be deplored that a great deal of poor material and workmanship will enter into the construction of many buildings. Some of this is due to the desires of owners who want their buildings constructed as cheaply as possible and are willing to sacrifice quality to cheapness. Much of it, however, is due to the fact that information is lacking in regard to the use of many materials of construction. This is particularly true of concrete and reinforced concrete construction, the present rapid development of which is in its infancy, and emphasises the great need of additional information in regard to structural materials. That the Government is alive to this need is clearly shown by the work it is carrying on in its laboratories at St. Louis, Mo., where extensive tests and investigations of structural materials, principally cement, concrete and reinforced concrete are being made. The result of this work will tend to establish on a safer and more practical basis the claims of different types and materials of construction to their respective merits.

THOMAS GIRTIN.

(Concluded from last week.)

GIRTIN and Turner were born in the British metropolis, and localised there from infancy to manhood. Constrained to seek prototypes from nature in their own immediate neighbourhood, it was from what they discovered worthy of imitation within that circumscribed sphere that they practised their art; they there became painters, and extended not their route in search of the romantic or classic of landscape until they could study it effectively; thus prepared, when they did seek nature more afar, they soon imitated what they saw, with all the attributes which are so gloriously displayed in the works of these great masters of old.

It is not in the scene itself, however grand or however beautiful, that the merit of a picture consists; it is in the manner of treating it. If proof of this were demanded, we need only refer to the pictures of the Flemish and Dutch school, amongst the works of the masters of the highest renown—Rembrandt, Cuyp, Ruysdael, Hobbema, Paul Potter, and a host of others, whose graphic compositions, simple and homely as they may be, are sought by the enlightened connoisseurs of all nations. These were collected in their own immediate neighbourhood; nay, frequently their own domicile supplied them with a subject for an interior, and a look out of their own casement with an exterior view. From these simple themes they produced pictures in value that would sell for ten times their weight in standard gold.

Girtin, as soon as he had acquired the power of delineating what he saw from the real object, found abundant subjects for study within a short distance of his home. The ruins of the ancient palace of the Savoy, near Somerset House in the Strand, furnished him with materials for the exercise of his topographical pencil. From the vast fragments of the remaining walls of this extensive ruin he made various accurate drawings; and a study which he made of the old steps of the watergate of this palace, according to his own testimony, was a lesson of improvement, from which he dated all the future knowledge which he displayed in the pictorial representation of mutilated masonry; certainly the old Savoy steps afforded one of the finest examples for this interesting feature of topographical

design. It was then on this spot that he obtained that knowledge of detail which subsequently enabled him to represent ruins in the foreground of his subjects with so much characteristic truth and mastery, with so little mechanical labour. Indeed, his finest works are more evidently the labour of the mind than of the hand.

From this spot his progress for a while reached about a mile westward up the Thames, which led him to the truly picturesque shore of Lambeth. Here, amongst the old houses occupied by the families of the fishermen, and other buildings rich in the material sought by the topographic painter, he found enough to delight his fancy and engage his art. Few spots indeed could have better supplied those objects which in the pursuit of local colour an artist seeks than the rudely built dilapidated overhanging dwelling-houses, potteries, whiting-mills and other examples of the main features of the pictorial of topography, than this part of Lambeth. It was here, then, that he studied the veritable colour and texture of old plaster walls, with here and there a patch of brick, tiled roofs that scarcely afforded shelter to the inhabitants beneath, timber gray with age, and tenelements propped with rude posts and piles, the very contemplation of which would almost suffice to create a topographic draughtsman. Lambeth, then, was the school in which Girtin acquired the rudiments of his succeeding knowledge of local colour.

It was on the shore of Lambeth that he found his prototypes for rude pictorial figures, male and female, in which it has ever within memory richly superabounded; here, too, he was amply supplied with the choicest models of that congenial object to such scenery—the picturesque peter-boat—and that commanding object for Thames scenery, the lofty and richly pictorial lime-barge. Onwards a mile still higher the opposite shore of Chelsea enriched his store of coloured studies; and thus near home he made himself a colourist.

The time was not remote from this period, when he had yet scarcely attained to manhood, ere he sought nature in parts distant from the Metropolis. He visited York, Durham and other pictorial scenes in the north of England; thence to Cumberland, Westmoreland and different parts of Scotland; and subsequently made the tour of South and North Wales. During this tour he painted two landscapes in oil, the only ones he ever executed; but what has been their destination we have not been able to learn. It was on these excursions that his mind developed the grand scenes, and still grander effects, under the sublime influence of that light and shadow which our atmosphere occasionally throws over mountain regions. These scenes he sought, even in the season of storms, and embodied their effects in his pictures with a power that his enthusiastic admirers proclaimed to be no less than magical.

Before that new epoch in water-colour art which originated with Girtin and Turner, the utmost that had been attempted with transparent colours thus prepared in subjects of romantic scenery was the representation of distant mountains in a thin vapour, and all the other large features advancing towards the foreground, in timid, undefined washes of semi-aerial tint. Indeed, the most admired works of Cozens affected nothing more than a grayish sort of chiaroscuro, wrought into harmony by washes, merely intimating the hues of nature. Girtin, restrained by none of the fancied incapacities of water-colours, at once struck out a daring style, determined to imitate what he saw, and thus, by the energies of his original genius, perceiving that certain operations of the sun upon the clouds threw the vastness of a whole mountain, that occupied the entire distance, under a deep and solemn mass of gloom, he gave it in his picture accordingly, and thereby clothed his composition with that awful sublimity of effect which stamped the scene with the majesty of nature.

The broad style and grand simplicity with which he ultimately produced these splendid effects led many amateurs to take lessons of Girtin; hence every day brought forth vast sheets of elephant and atlas besmeared with Cologne-earth, Vandyke-brown, burnt terra-sienna and indigo blue—the rage for this dashing style was quite laughable. "Oh!" exclaimed each and every one of these amateurs, "do but teach me how to draw with this sort of daring-dashing effect, and I shall be content." Honest Tom Girtin—for so he was designated—was not willing to minister to their folly; indeed, he endeavoured to dissuade them from the attempt, but his efforts were vain—the delighted amateurs would try again, more paper was consequently spoiled—he could not help it, for the mania seemed to be incurable.

Girtin was of a kind and friendly disposition, and ever ready to communicate whatever he had discovered in his experiments to those who sought his assistance. He, however, was in youth a free liver, and associated with persons little qualified to improve his manners; these uncultured, from his natural love of ease, induced a shyness which made him shun rather than seek the acquaintance of the polite and well-bred. When travelling to the North he could take his passage in a collier, and his delight was to be in common with the crew, eating salt beef, drinking grog, and smoking and exchanging jokes with them. When on shore in search of the picturesque he sought the kitchen of the inn for refreshment, where he might enjoy himself without sacrificing his love for independence, and store up anecdotes and characters suited to his purpose.

His evenings were frequently passed at the house of Harris, a frame-maker, in Gerrard Street, Soho, the rendezvous of many artists of the day, at which time George Morland was also a constant visitor there, and sometimes an inmate. Harris was a dealer in drawings, and Girtin preferred selling his works through the agency of Harris to the disposing of them to private gentlemen. Morland entertained the same notions—hence Jack Harris, as he was dubbed, got much money by doing the agency for each. No such rare geniuses as these, and so remarkable for their indifference to public opinion, it might be reasonably supposed would have smoked their cigars together in social eternities, it was, however, far otherwise. Morland courted society because he loved to be “king of the company”; whilst Girtin, who was courted by good society, preferred to live with an inferior class merely to escape trouble, and far from domineering over these his associates he never for a moment was known to assume the least superiority. It was truly with him, “Hail, fellow, well met.”

For two or three winter seasons previously to his death he belonged to a little “sketching society,” formed at his suggestion by a fraternity of amateurs and professional artists—chiefly, as may be supposed, for the improvement of these his associates. No little coterie could be more respectable; and it was probable, had Girtin lived and this society continued, that his habits might have been wrought upon thereby, much to his benefit.

The plan of this society was to meet at the respective apartments of the members, and for each to make a sketch in drawing, in chiaroscuro, from some given subject from the poets. Certain amongst these impromptu productions of the club were much and deservedly admired. Each member at whose house the parties met supplied paper and brushes, and the designs for the evening became his property. They met at six, were entertained with tea and coffee, worked and chatted until ten, when a cold collation was served, and at twelve they separated.

Girtin was for some time the pupil of Dayes, a good off-hand sort of a draughtsman, under whom he acquired that knowledge of perspective which enabled him to delineate architectural subjects with characteristic correctness; but during the period of his pupilage, and indeed for some short time subsequently, his drawings were more remarkable for cold precision than for any of those superior effects which were displayed in his works after he commenced sedulously to colour from nature.

About the same period Turner became the pupil of Thomas Malton, who also drew topographical subjects with great correctness, but not with painter-like feeling; he was an eminent professor of perspective, and published a celebrated work on that art. From so able a master he obtained that superior knowledge of the science of linear perspective which was so conspicuous in his early architectural drawings.

Girtin and Turner soon left their respective preceptors at an immeasurable distance behind; they were the first who used the three primitive colours in laying-in the chiaroscuro of their subjects, producing by their combinations those warm and cool russets which required only the glazing to produce harmonious drawings. Subsequently, however, they worked upon a superior and more painterly plan by preparing the general effect by laying-in the local colour of each object at once, and it was not until they ventured upon that process that they produced those rich and splendid compositions that almost vied in general effect with paintings wrought in oil-colours.

Much of the knowledge which Girtin obtained in the play of contrast of colour in open landscape was derived from the study of Wilson, whose bold and effective pictures in oil Girtin might be said to have translated into water-

colour. The vigour and richness of his architectural subjects, which were no less striking, was alike ascribable to his contemplation of the pictures of Canaletti; indeed, he was alternately designated by his admirers, when he first evinced that power in his works, which had never been before seen in drawings, the Wilson or the Canaletti of water-colours, until improving by practice and increasing in power and judgment he achieved works that could be likened to nothing in art that had preceded his style.

One of the first striking efforts of his graphic powers, as they related to a knowledge of topographical effect, was displayed in a panoramic view of the city of London on a large scale. This was exhibited in Castle Street, Leicester Square, and was the precursor of that species of scenic representation. The scene which Girtin chose for his picture was, “St. Paul’s and the buildings east and west, as seen from the lofty roof of the Albion Mills,” then situated at the entrance of Blackfriars Bridge, on the south side of the Thames. This panoramic picture, which he completed when only in his twenty-third year, was one of the finest pictures of a city that was ever painted, and was universally admired by all judges of art. After his death it was sold to a Russian nobleman, who took it out of the country. There were also several other views of streets in the neighbourhood of St. Martin’s-le-Grand, where his mother had a house and shop during his boyhood, and to the scenes of which he seems often to have recurred with pleasure in his after-sketches.

The constitution of this extraordinary artist having suffered from the careless habits which he had too long indulged, in spite of his own good sense and occasional reflections—for he was conscious of his moral infirmities—brought on him a pulmonary complaint, which it was hoped might be relieved by change of climate; he therefore, acting upon the recommendation of his medical adviser, went to the Continent during the peace of 1802. Finding himself solitary at Paris, where he sojourned, his stay was not long, but such was the love of his art that he there made a series of sketches of certain streets and public buildings of the French capital which on his return to London he etched in soft ground, and having the effects, which he washed in on the spot, engraved on these outlines as facsimiles in aquatinta. The series were published by him and his brother. The brother, John Girtin, was a writing engraver, and some years subsequent to the death of Thomas Girtin lived in Castle Street, Leicester Square, where he had the misfortune to have his house and stock-in-trade destroyed by fire. His wife, who was ill at the time, died in his arms as he took her out of the house. This fire was the more unfortunate, as many of Girtin’s works were there also destroyed, thus conferring a greater value upon those which he left. It must, however, be observed that though during even his short career his performances were astonishingly numerous, yet a great number of copies by Francia and others have been sold too often designedly as his.

It might be supposed, by the bold and broad execution which characterise the works of Girtin, that they were mostly off-hand productions. The contrary, however, is the fact. It is true that he could sketch, and did occasionally dash-in his effect, with rapidity; but his finely coloured compositions, though apparently like the pictures by Wilson, the result of little labour, were wrought with much careful study and proportionate manual exertion. In some of his productions it has been demonstrated that his treatment, like Wilson’s, was careful, notwithstanding his bold execution, even to fastidiousness. It is true he did not hesitate to undo what he once laid down, for he worked upon principle: but he reiterated his tints to produce splendour and richness, and repeated his depths to secure transparency of tone, with a perseverance that would surprise those who were not intimately acquainted with the difficult process of water-colour painting to produce works that merit the designation of pictures.

The premature death of Girtin was considered as an irreparable loss to the water-colour school of the fine arts; for it was evident by the great progress he was making, even whilst reduced by disease, that what his pencil had yet developed was only a part of what his mind was capable of communicating to his hand. Indeed it may be truly said, in honour to his memory, that he was, as a painter, unquestionably one of the greatest geniuses of the age. For some years previous to his death, which occurred November 9, 1802, it is to be presumed that his habits had become considerably altered, as his surviving relatives, from their knowledge of him, deny the concurrent testimony of his former associates. It was perhaps a matter of very serious regret for Girtin that

he, as well as Harlow, was left without a father at a very early age. Had he been restrained in his youth by a father's severe control, the world of art might not have had to mourn his early death. It is a curious circumstance that the custom of placing the gravestone with its front due east was departed from in the instance of this artist. His remains were interred in the burial-ground of St. Paul's, Covent Garden, on the south side, to the left of the paved path (near the west gate of the church) to Bedford Street.

A BUILDING MAP OF LONDON.

THE question of the preparation of the ground plan of London and the 6-inch annual map of London having been referred to the improvements committee, the following information is given relating to both these matters:—

The Council on March 13, 1894, decided to prepare, for its own use, a ground plan showing the various freehold ownerships in the county of London. This course was taken in view of the fact that great difficulty had been experienced in ascertaining the ownership of property affected by street improvement and other schemes. The work consists of ownership and detail sections, and is being carried out by the valuer.

The ownership section consists of defining estate boundaries and registering the names and addresses of the owners or their agents. It was originally intended to deal with large estates only, but when particulars of most of these had been obtained, the information was found to be of such value as a means of reference that the work was extended so as to include all holdings. The information for compiling the map is derived from several sources—Government departments, local authorities, owners and agents, the Council's records and the inquiries made by the Council in its ordinary course of business.

The work of many of the services administered by the Council has been greatly facilitated by information available in connection with the ground plan. When any scheme involving the acquisition of property is approved by the Council and requires Parliamentary sanction, the scheduling of the property affected by the scheme is expedited and more economically referenced, as the plan furnishes particulars as to the majority of freeholders; and in searching for sites, whether for housing or other purposes, it is possible by means of the ground plan to expedite their selection by avoiding sites where a number of owners would be concerned, or where, for other reasons connected with the ownership, the acquisition of such sites would be likely to prove tedious or expensive. Information is also frequently obtained from the ground plan which saves delay, correspondence and expense. These advantages, of course, increase as the plan approaches completion. On May 30, 1905, it was stated:—"We are satisfied that the ground plan is of very great utility, and that the work of the Council, more especially in connection with the acquisition of property, has been considerably facilitated. We have been assured by the valuer that the advantage derived from the possession of the information which has been collected has already resulted in a saving to the Council of more than 13,400*l.*, the estimated cost of the whole plan when completed, in addition to which the Council possesses the most complete record in existence of ownerships in the county of London."

At the end of March 1907 the ownership of 109 square miles and 87 acres, represented by 23,148 estates, had been ascertained, defined upon the sheets and registered, and a further 180 estates were awaiting to be drawn upon the sheets. The area which is now being dealt with involves a much larger amount of work than that already disposed of owing to the estates being small. The rate of progress is consequently slower and *pro rata* more expensive.

The Council has authorised the expenditure of a total sum of 13,400*l.* for the ownership section. The total expenditure up to the end of March 1907 was 11,416*l.*, the average cost being 9*s.* 9*d.* an estate.

The detail section of the ground plan consists in the keeping up to date of the existing 5-feet Ordnance Survey as the several alterations arise. As the ownership work proceeded some difficulty was experienced in dealing with the outlying districts of the county, owing to the constant development of building land necessitating surveying and plotting the altered boundaries, and it was considered that by slightly extending the work of surveying the 5-feet Ordnance Survey of London might be made and kept up to date. The Council on May 16, 1899, sanctioned this addi-

tional work on the understanding that the revised information would be of such value as to warrant the expenditure upon it. Constant reference to the revised sheets is made by departments of the Council and the information obtained is of service in various ways. Particulars of the alterations have been placed on sale and persons can now obtain tracings upon payment of nominal fees.

The 6-inch annual map of London shows the progress of building operations from year to year. Having regard to the long interval between the revisions of the Ordnance Survey, such a map is very useful for public purposes. The first map was issued and placed on sale in 1903; the second edition in 1905. A third edition, considerably improved by the addition of about 3,000 road names, will be ready for issue in July 1907. The map is of considerable use in many departments of the Council, and to local authorities and others. By using this map as a basis a map for educational purposes has recently been prepared at a cost of about 300*l.* less than the lowest estimate obtained for a map which would have been several years in arrears as regards the groundwork.

EARLY HISTORY OF "CHRISTIE'S."

AT the Turk's Head tavern in Gerrard Street, Soho, the earliest conclave was held to cogitate upon the important question of the utility of a National Academy for the promotion of the arts of painting and sculpture; and from thence resulted the St. Martin's Lane Academy, the exhibitions of the Society of Artists, and the ultimate founding of the Royal Academy. Garrick, Goldsmith and others its artists who frequented this tavern afforded their friends aid in support of the project—one, indeed, which had been long before attempted by their predecessor, Sir James Thornhill, but without success.

Amongst other nightly visitors of the Turk's Head were the renowned Cock and his no less celebrated successor, Langford, two auctioneers of the age of George II. The society of the artists was judiciously sought by the worthies, over and above other considerations, as beneficial to their picture sales. Cock has the reputation of being the founder of sale-room oratory. He was a very personable man, and had an easy and elegant address. His portrait, in cravat *à la mode*, beaush peruke and coat of fashionable cut, existed over the chimneypiece of the great room up the stone staircase in the rear of the north arcade of Covent Garden, in which George Robins used to preside. Cock having ended his career, Langford had the whole field open to him. He became the most fashionable auctioneer of the Metropolis.

The fame of Cock and Langford, however celebrated in their day, was thrown into shade by the career of Christie. The principal pictures imported from abroad, and the collections that were to be sold by order of executors, had been heretofore advertised for sale at the rooms behind the Piazza, Covent Garden; but the English had never yet beheld such splendid collections as those which were subsequently consigned to the hammer of Christie. The perturbed state of the Continent soon after the commencement of the French revolution rendered England the great picture mart, and each spring season a number of succeeding years produced a magnificent exhibition of the choicest works of the old masters upon the walls of Christie's auction-rooms in Pall Mall.

James Christie the elder was originally employed in the service of an upholsterer near the top of Berners Street, and whilst young and active cheerfully assisted in beating many a feather bed upon a stage erected on the dead ground, the site on which Middlesex Hospital now stands. His manners obtained for him the esteem of many of his employers, and amongst others that of a Mr. Jones, who, being wealthy, placed Christie in a shop well supplied with books in Wardour Street, where he opened business as a book auctioneer. Diligent and successful in his calling, he improved his means, and, removing to Spring Garden, Charing Cross, commenced as general auctioneer under the firm of Christie & Ansell. It was here he experienced his first great loss, the precursor of those misfortunes which his generous nature too frequently exposed him throughout life. He became, under particular circumstances of friendship, security for a minor of great expectations the amount of 20,000*l.* The young gentleman died just before the expiration of his minority and Christie lost the whole sum. Happily he had many friends, amongst others the illustrious Garrick. No sooner was this great play-

grieved with Christie's loss than he generously advanced him the loan of 10,000*l.*, which the borrower within a given period repaid; and such was his grateful recollection of the circumstance, that when deputed by Garrick's widow to sell part of her honoured husband's effects, Christie very feelingly related the whole affair to his auditors from the rostrum.

Subsequently Christie removed his business to the Royal Academy rooms, next to Carlton House, and also occupied the well-known premises many houses westward of this site. For a short period he was joined by two partners—Sharpe, a diamond merchant from the City, and Cooper, a brother of the wife of John Bannister, the comedian—but this firm was soon dissolved.

Christie, though not exactly a connoisseur, occasionally made an eloquent display of his talent as a seller of articles of vertu. He had the advantage of a constant friendly intercourse with many of the most distinguished artists and connoisseurs; so much so, indeed, that a certain coterie, who frequently partook of his venison and claret, were dominated Christie's fraternity of godfathers, as they sometimes in the character of sponsors christened questionable graphic specimens of the genius obscure menichinos, Sebastian del Piombos, Da Vincis and other high-sounding names, delectable to the ears of certain collectors.

The elder Christie, being a man of quick perception, could not fail to derive due benefit from the judgment of such authorities as Reynolds, West, Gainsborough and other members of the Royal Academy, who were constantly indulged with a private view of every importation of valuable pictures consigned to him from abroad. Hence, quickly catching the spirit of their critical remarks, he attended the rostrum with confidence, expatiated on matters of taste with the enthusiasm of an amateur, and enlarging upon the merits of a picture in the learnedomenclature of a connoisseur, astounded the far greater part of his auditors. It must be admitted that his mettlesome fancy sometimes carried him clean over the pale of discretion into the field of hyperbole, though he rarely said far; for judgment, taking his steed by the bridle, soon walked him steadily back again.

No man of his calling perhaps ever more zealously discharged his duty to his employers. He would dwell over a picture and seduce a reluctant bidder out of another arena, with as much eloquence and patient perseverance as when selling the Pitt diamond, or a vast estate where each holding advanced a thousand pounds.

The feelings of his son it is believed never were congenial to the business of an auctioneer. It was intended by the father to place him in the Church, a profession which the son would have eagerly embraced; but it was vitally essential to the interest of the father that he should enrol himself in the firm. Young Christie yielded to his wishes, and by this noble sacrifice of inclination to filial duty he mainly helped to save the declining fortunes of a fond father, and became the main prop to the stability of his house.

The younger Christie first ascended the rostrum in the spring of 1794, when, to relieve his father from the fatigue of a six consecutive days' sale of the effects of John Alexander Gresse, an artist and celebrated collector, then lately deceased, he took the hammer for one day. He was then about one-and-twenty years of age. On this occasion it was obvious that he wanted that becoming confidence so indispensable to him who addresses a public assembly; though he was sufficiently collected to express his thoughts in elegant language, yet at times he was scarcely audible, and addressed the company with a faltering tongue. This diffidence seemed too frequently to impede the public exercise of his fine talents, even to a late period of his life.

The father, in all his transactions, acquired universal reputation for honour and integrity, and so almost boundless was his liberality that he was commonly designated the princely-minded Christie. Had he possessed these virtues in a less romantic degree, or put them into operation with more regard to self-interest, doubtless his family would have had to divide an ample fortune. He died honoured and respected, but certainly not rich.

Mr. Rowland Plumble, the assessor appointed by the Edmonton Board of Guardians to adjudicate upon competitive designs for a new workhouse infirmary, has given his award in favour of drawings by Mr. Stuart Hill, which provides accommodation for 812 beds. The estimate of the cost of the works is 152,640*l.*

THE TEMPLE OF AIZANI.

IN 1833 M. Guizot was Minister of Public Instruction in France and he commissioned Charles Texier, who was then a young architect, to explore Asia Minor and Persia. He lived for several years in those countries and made detailed drawings of the principal buildings. He was the first traveller who gave a precise account of the remarkable ruins at Aizani. Little is known about the history of the place. It is mentioned by Strabo as part of Phrygia Epictetus under the name of Azani. Pausanias says the inhabitants came from Arcadia, and adds:—"These Phrygians, who dwell on the borders of the river Peucella, have built there a temple to the Mother of the Gods" and a grotto which is circular and of great height.

The first building that attracts notice on approaching Aizani is a temple, which, being raised on a considerable eminence, forms, like the Parthenon of Athens, a conspicuous object from a distance, and commands the rest of the town. Instead, however, of being, like the Athenian Acropolis, the natural rock, enclosed on its summit with walls, but otherwise quite unshaped, and having its buildings placed quite irregularly without any regard to symmetry of general arrangement, the eminence upon which this temple at Aizani stands forms an elevated platform or terrace cut out of the hill and perfectly regular in its plan, which is a parallelogram and nearly a square, its measurements being 532 feet (English) on its north and south sides and 480 on its east and west. From the remains of walls at the north-west angle it is conjectured that the platform of the terrace formed a peribolus or court to the temple, enclosed on three of its sides, while the east one (corresponding with the entrance end of the temple) was left open, and on that side the face of the terrace was decorated architecturally throughout its entire extent by a series of twenty-two arches with pilasters between them, *i.e.* eleven on each side of the central flight of steps (100 feet wide), forming the ascent to the upper level. Thus the terrace here formed a magnificent substructure that, together with the temple, must have produced an unusually striking and imposing effect. The temple itself stands exactly in the centre of the peribolus or platform, consequently exactly facing the ascent up to it. This edifice, which appears from inscriptions found among the ruins to have been dedicated to Jupiter of Aizani, is now more than half destroyed, little more remaining than the columns of the north and west sides and the corresponding portions of the cella; yet what is left affords sufficient data for determining with accuracy the particulars in regard to its plan and the peculiar character of its order. The style is Ionic, of the Græco-Roman system, octastyle, pseudodipteral, with fifteen columns on its flanks. Its general dimensions do not exceed 104 feet by 53, or, including the broad socle on which it is raised, 121 by 72. The whole is constructed of white marble, and the columns, 31 feet high, are each of them wrought out of a single block; but what gives such interest to this monument is that it affords a very remarkable example of the Asiatic Ionic, decidedly differing, at least in its entablature, from any specimens heretofore known. The columns have the peculiar Asiatic Ionic base, but are not otherwise remarkable, except for the singularity of there being a small vase or urn carved in the upper part of each channel of the fluting; these are, of course, so very diminutive that they could hardly have been distinguishable at that height, and therefore were probably intended only to produce the effect of an enriched collarino or necking to the capital with the fluting continued through it. Far more remarkable is the entablature, both for its proportions and decorations; the architrave, which is divided into three fascias with carved bead mouldings, is considerably deeper than the frieze, which excess is caused by the unusual breadth of its coping, consisting of a large ovolo and cavetto above it, both enriched. The frieze is still more remarkable—even unique in its design, which is such as to render it most difficult to describe: large upright acanthus leaves placed singly at intervals after the manner of triglyphs are placed beneath a sort of consoles formed by the junction of two scroll-like volutes, meeting each other in front like those at the angle of a Corinthian capital, to which they bear a very strong resemblance; therefore, taken with the acanthus leaves beneath them, they give the frieze a certain Corinthianism of character. The cornice again differs both from Greek and Asiatic-Greek examples of the order, inasmuch as, in addition to the dentils of the latter, it has small modillions; the corona is narrow, the cymatium above it, on the contrary, very deep and enriched

with a flower pattern. Taken altogether this specimen of the Ionic style is an interesting and valuable acquisition to our studies of the ancient orders, and serves as another striking proof of the freedom and diversity with which they were treated.

Beneath the cella is a subterranean chamber or crypt 52 feet by 29 feet 6 inches, with a vaulted ceiling; light was admitted into it by means of *abat-jours*, or apertures in the pavement of the colonnades next the walls of the cella, and the steps leading to it were within the posticum. Several columns now lying on the ground within the peribolus indicate that the enclosure must have been adorned with them, since they evidently do not belong to the temple itself, being not much above half the size of the others, and besides the lower parts of their flutings are cabled. The temple was probably erected about the second century of our era.

After this temple the chief other monuments discovered at Aizani are a theatre, stadium and gymnasium; the first of these, which is in better preservation than almost any other ancient structure of its kind, is 185 feet in its greatest diameter, and the spectatory had sixteen rows of marble seats, but those of the upper or second tier are nearly all destroyed; the podium, however, of that tier, or the wall of the *præcinctio* separating it from the lower one, is for the greater part remaining, and shows one peculiarity, namely, niches placed at intervals in pairs, of which there were altogether twenty-four. The orchestra forms more than a semicircle with a radius of 66 feet. The scena was decorated with six pairs of coupled Ionic columns, but these have fallen down and are lying with a mass of other ruins and fragments in the orchestra. The lower range of seats only remain.

The stadium, which is a little to the south-east of the theatre, measures 725 feet in its extreme length and 152 feet in its extreme breadth. There were two *pulvinaria* or *loggias*, one for the magistrates, the other for the directors of the games, and ten rows of seats along each side, capable of accommodating between 12,000 and 13,000 persons.

Of the gymnasium, or what is supposed to have been such, and which is situated to the south of the peribolus of the great temple, little more remains than a Doric colonnade extending upwards of 200 feet, whose pillars are all of white marble and of a single piece. To the north-west of the temple are also some ruins of what is supposed to have been a basilica. The river *Rhyndacus*, which passed through the city, was crossed by two bridges of white marble, each consisting of five semicircular arches. Both are remaining, as also the parapets of the quays along the river, which, like the bridges, are constructed of white marble and ornamented with sculptures. Reproductions of a dozen of Texier's plates will be found in R. P. Pullan's volume, "The Principal Ruins of Asia Minor."

BIRMINGHAM ART GALLERY.

AT a meeting of the Birmingham Museum and Art Gallery committee on Monday letters were read from two donors, who wish to remain anonymous, presenting to the gallery several valuable studies by John Ruskin. The drawings consist of a water-colour, "A Coast Scene near Dunbar," a work in sepia, "A View near Florence," two drawings entitled "Alpine Peaks" and "A Coal Merchant's Shop," the latter being a work executed when Ruskin was little more than a lad; a study of "Primroses" in pen and colour, and two studies in pencil after works by Turner. The trustees of the Griffith's fund have presented a pencil drawing, "Two Bridges of Coblenz"; and the trustees of the Public Picture Gallery fund have given a water-colour drawing "Aiguilles of Chamouni," a coloured Venetian drawing of arches and capitals, and two works in pencil, "Lady Glenorchy's Chapel, Edinburgh," and "An Italian Village." These drawings form a valuable addition to the series by John Ruskin acquired some years ago.

The Government of Victoria, Australia, have offered to pay an annual ground rent of 874*l.* for a site for the erection of offices at the corner of the Strand and the eastern spur street between the Strand and Aldwych. The land has an area of about 1,440 square feet, and has frontages of 25 and 65 feet to the Strand and to the spur street. The offer is to be accepted by the London County Council.

GENERAL.

Mr. E. G. Dawber, the assessor appointed by the Wednesbury Corporation for the new Carnegie Library plans, awarded as follows:—First prize of 50*l.*, Messrs. Croft Butler & Savage, Birmingham; second prize, 30*l.*, Edwin F. Reynolds, Birmingham; third prize, 20*l.*, J. H. Vernon Cale, Birmingham.

Viscount Turnour on Tuesday asked the First Commissioner of Works by what date the new road between the Mall and Trafalgar Square would be completed. Harcourt replied the date would depend upon the completion of the building. It is expected that it will be finished early in 1909.

The Parishioners of Sarum St. Edmund last week celebrated the five hundredth anniversary of the rebuilding of their church. St. Edmund's dates from 1268, in which year it was founded by Walter de la Wyle, canon and sub-dean, and afterwards fifth Bishop of New Sarum, and dedicated to St. Edmund of Abingdon, Archbishop of Canterbury who when he was called to the Primacy in 1233 was rector of Calne and treasurer of the cathedral. The church was rebuilt in the reign of Henry IV. and the episcopate of Robert Hallam, being finished and opened in 1407. The fabric has undergone many changes since that day, but the greater part of it remains.

The Edinburgh Architectural Association set out for York for their annual excursion to-day, the 21st inst. The excursions arranged for Saturday include visits to Guildhall, St. William's College, the treasurer's house, Minster and St. Mary's Abbey. A return to Edinburgh will be made by the 6.15 P.M. train.

The Bill for the Incorporation of the National Trust Places of Historic Interest or Natural Beauty was Monday before the Examiners of Standing Orders in Parliament. This measure has already passed the House of Lords, and was now ordered to be advanced to the second reading stage in the House of Commons.

The Laying of the foundation-stones of Hexham Abbey will take place at a service to be held on St. Peter's Day, June 29. Messrs. Temple Moore and C. C. Hodges, the architects, estimate the cost of the work to be done at between 9,500*l.* and 10,000*l.*, of which 1,200*l.* is for heating apparatus, 1,100*l.* for lighting and 1,400*l.* for seating the nave. They suggest that the chapter-house should be restored at a cost of 9,000*l.* The rector states that this could be used to house local antiquities.

The Claim of Sir A. Brumwell Thomas, architect, against the Corporation of Belfast has been settled. The sum of 4,551*l.* 6*s.* is to be accepted. Previous payments amounted to 7,500*l.*

Sir Weetman Pearson has presented to the House of Commons the two pictures which are now hanging in the members' dining-room. One is a portrait, by C. Janssen, of Lord Cottington, and the other a portrait, by Sir John Kneller, of Spencer Compton, Lord Wilmington. Both pictures came from the Duke of Fife's collection recently sold.

The Provisional Committee in charge of Edinburgh Art School had a meeting last week to make temporary arrangements for the carrying on of the present art school pending the erection of the new Municipal Art School at Lauriston. The committee decided that so far as possible the present arrangements should be adhered to and the staff kept until at least the new buildings are ready.

At the Last Meeting of the Sunderland Town Council one of the members, on a proposal that a certain plan be adopted for a branch library, asked for an inquiry, on the ground that the plan was marked and certain councillors were informed what the mark meant. The statement caused a sensation, and after discussion the report was taken back so that the matter might be investigated by the committee.

The Dundee College Council last week considered details of plans for the new physics laboratory. Members expressed themselves as greatly satisfied with the accommodation provided and the elevation of the building, and it was remitted to the works committee to meet Sir Rowland Anderson, the architect, next week, adjust points of detail and take in estimates for the work.

Public Baths are to be erected in Derby Road, Weaste, by the Salford Town Council. The cost, including site, is estimated at 24,000*l.*

OF THE
UNIVERSITY OF ILLINOIS.

The Architect.

THE WEEK.

late S. J. WARING must have had the satisfaction of having all his ideals realised. As a maker of furniture he was not satisfied with keeping in the track with others; he sought improvements and his work was appreciated. His business grew rapidly in Liverpool, and it was found necessary to set up another establishment in Manchester. His sons fully shared in his aims, and consequently there was a controlling power in the business of a strength and vision which could not be matched elsewhere in the land. It seemed a rightful consummation that the business of GILLOW, which was so renowned in the north, should become amalgamated with the firm who had led to have the future of the trade in their hands. Another sign of growth was seen in the opening of the premises in Oxford Street, which undoubtedly are the finest among the business exhibitions of the world. In another direction the creation of the Waring-White Sewing Machine Company was a sign of further progress. The recognition is not given to many men that they had accomplished similar aims, and that the name they bore was sure to be recognised in the future as a synonym of success.

It is satisfactory to learn that His Highness JAM RANJITSINHJI has profited by his experience in England, and is resolved to encourage building as far as possible in his territory. Subscriptions were received for raising a statue of the late JAM at a cost of £200. His Highness proposes to add a sufficient sum to enable a training school, hospital and boarding-house for students to be erected instead of the statue as a memorial. A trust has been formed for the improvement of Nawanagar. Facilities are to be given for the erection of dwellings for the humbler classes outside the capital, and a better style of building for others will be encouraged. A grain market is to be constructed and the public buildings are to be repaired. In that way English ideas will be disseminated in a more efficient manner than by school books or imitation of our official system.

ALTHOUGH the London County Council have not formally approved of all the arrangements of the competition for the new county hall, the establishment committee have brought forward a proposal for the erection of a place for the exhibition of the designs. It is anticipated that the accommodation will be required for three or four weeks, and, owing to the nature of the work to be done by the assessors in considering a number of large designs, the space required should be of special character. It is suggested that one of the libraries of the London University should be hired for twenty-eight days at the rate of 7l. 10s. a day. It will also be necessary to provide screens on which to hang the designs, and it will be more economical to hire them at an estimated cost of 60l. A small sum is required to cover expenses in conveying designs from the county hall to the University and for assistance in packing and unpacking the designs. The total sum, therefore, which should be provided is approximately £1,000. The latest date for the reception of designs is August 27, 1907.

HERE may be new regulations in connection with the latest amended Workmen's Compensation Act. But we have heard in the Liverpool County Court on Friday that a builder runs a risk when he consults a medical referee as if he were an ordinary practitioner. A builder employed by Messrs. THORNTON & SONS fell

while laying a floor and sustained injuries. He was removed to the hospital, where he underwent an operation. He recovered, and it was considered he was able to work. The workman's doctor declared he was unfit for labour, and the man declined to submit himself to the medical referee. The insurance company asked the latter to examine the man, but it was not formally stated that he was the medical referee. The workman's solicitor therefore objected to the report when the employers sought to have the weekly payment reduced. The Judge referred to the position of a medical referee, and said that in cases of doubt he could not be recognised apart from his office. As the workman was not made aware who was examining him, the report could not be accepted as conclusive, and the application was dismissed with costs.

HOUSE-PAINTERS, builders and architects also are made responsible for defects in work which are the result of the adulteration of white lead. Although it has been demonstrated that zinc oxide, besides being safer to use owing to its non-poisonous character, produces purer colours, yet habit prevails, and white lead is commonly employed. It is needless to say it is often adulterated with substances which have an injurious effect on the painter's work. It is now, however, possible to make such adulteration a punishable act. Last week a case was heard at the Hereford police court which deserves attention. When it is said that two King's Counsel appeared the gravity of the proceedings is suggested. The prosecutors were the London Chamber of Commerce. Four 28-lb. tins of white lead were ordered by the Guardians of the Hereford Union. It was supplied through the local contractor by Messrs. BLUNDELL, SPENCE & Co., LTD., of Hull. A sample of it was sent to the London Chamber of Commerce, and on analysis it was found to contain 30 per cent. of sulphate of baryta—a material which is the painter's enemy, although it is sometimes called his friend. For the defence, evidence was called to prove that for years white lead containing barytes was sold as white lead Nos. 1, 2 and 3. The magistrates said they were glad the final decision did not rest with them, and they did not believe defendants had any intention to defraud. But, as it was a test case, they resolved to impose a penalty of 10l., with 100 guineas costs, subject, of course, to the right of the defendants to appeal to a higher Court. It should be mentioned that the tin was marked "No. 2 white lead," and the initiated would therefore know the character of the mixture. But whether the Courts can approve of the arrangement remains to be seen. "Genuine white lead" is the mark of an unadulterated material, while "Reduced white lead" is another designation for a mixture.

WE have already mentioned some of the gifts of the late M. OSIRIS for the benefit of the French people. During his lifetime he had presented Malmaison with furniture and works of art suited to it which must have cost him a very large sum. For the removal of the statue of JOAN OF ARC in Nancy and the erection of railings around it he bequeathed 4,000l. A similar sum is bequeathed to Lausanne, to which he had already given a statue of WILLIAM TELL, by MERCIÉ. For erecting a chapel as a memorial of TELL he left 2,000l., and a like sum for the construction of a synagogue. The city of Paris is to receive 4,000l. for the erection of a group which will symbolise the charity of Mme. BOUCICAUT and Baroness HIRSCH. The city of Bordeaux will receive 80,000l. for a day home for the poor, and which will resemble a house-boat on a large scale. His estate at Sauterne is presented to the nation in order that it may serve as a school in wine-making and wine-growing. Several prizes have also been founded. The residue of his estate is to be applied towards assisting investigations at the Pasteur Institute.

ROADS, RAILWAYS AND BUILDINGS.

ON two days in succession last week there were some public utterances respecting means of communication which are worth the consideration of architects. The President of the Board of Trade on Saturday officially opened a "Tube" railway which connects Hampstead and Golders Green with Charing Cross. According to Mr. LLOYD-GEORGE, the new line will do more to solve the housing problem in London than the most skilfully devised Act of Parliament. He pointed out that last year 240,000,000 passengers made use of the underground railways, and yet the streets of London continued to be congested. Sir EDGAR SPEYER, the chairman of the company, declared that the tube railways had caused thousands of acres of land to advance greatly in value, with consequent advantage to their owners, as well as increase in the taxable and rateable value of the districts in which they lay. They would also save vast outlays in connection with the widening and maintenance of streets, and in relieving the congestion of traffic would be the means of saving time to the users not only of the tubes themselves, but also of the streets. But he did not inquire whether the creation of the new residential areas was not followed by a corresponding decline within the metropolitan district.

The municipal and county engineers had been also considering the subject of communication the day before in Liverpool, and they resolved to memorialise the Board of Trade not only to make special grants from the Exchequer for road maintenance, but also for an Act "to enable local authorities to regulate and control the planning of main thoroughfares and building areas, and to prescribe the number of houses to be erected on an acre of ground; also to give power to local authorities, with the sanction of the Local Government Board, to acquire land for open spaces, and to facilitate an improved development of their respective building areas." Those expressions of opinion may be taken as evidence not only of the inadequacy of existing roads in town and country to serve the requirements of our time, but also of the costly projects which alone are offered for their future improvement.

The business of the civil engineer was formerly defined as consisting in the construction of aids to facilitate communication between men. The humble road surveyor, the railway engineer of the old school and the later designers of tubes for underground passages and of immense viaducts over precipices, rivers and arms of the sea would, in that way, be found to have aims in common, however different might be the manner of realising them. By the ordinary economic law and because they have all done their work so well, they have created a demand for further facilities. It is not only roads and ordinary railways which are found to be inadequate, but every new tube demonstrates the necessity for others of a higher class. Having gained time and overcome distance by means of electric power and roads which present no obstacle, men now grumble about the time spent in travelling unless it is reduced to a minimum. Where it is to end nobody can foretell.

It is remarkable that while the traffic exceeds the estimated number of passengers, the railways which provide for it are generally worked at a loss. The history of the District Railway would by itself be enough to scare speculators from attempting similar work. The tube railways, although especially adapted to existing conditions, and although they escaped the enormous outlay which was required for purchasing ground for the earlier underground railways, cannot be considered at present as profitable enterprises. Whether shareholders will derive consolation from Mr. LLOYD-GEORGE's optimistic anticipation that hereafter they will reap profit is a doubtful question. But a railway like that from Charing Cross to Golders Green, and which cost 720,000*l.* per mile, should at least yield as much dividend as Consols to those who provided the money. It

is well to bear those facts in mind when questions of road improvement are discussed. Managers and engineers, although they may possess experience, should always be certain of results; and, judging by what has taken place, it might be said that the more nu- merous the tube railways, the greater will be the loss to shareholders. The limit is reached when expenditure cannot be recovered from receipts.

Everyone knows that a belief is now prevailing in the ground concerning the duty of the State to make compensation for the deficiencies in the provision of such railways as those which serve for the traffic of the Metropolis. Mr. LLOYD-GEORGE spoke of the trap which had been set for him in order to compel him to explain the views of the Government about a Traffic Board, increased fares and delimitation of public and private enterprise. In other words, managers who are interested in finance wish the State to take over railways what the municipal and county surveyors have asked for in connection with highways, viz. to make special grants towards the additional cost of maintenance. Neither shareholders nor surveyors would like to know whether the whole country should be compelled to contribute or those parts of it which received the greatest benefits. It may seem a short and easy method of getting over the difficulty. It is, no doubt, contrary to the ordinary practice in this country, but economists approve of governmental road-making. DE LAVELEYE lays down the principle that, "after a certain instruction, there is no more powerful cause of improvement than an improvement in the means of communication." Accordingly he concludes that "since the nation is benefited by any increase in the revenue of taxes, or in the productivity of all the sources of production, it follows that the construction of railroads, &c., even though they do not yield a direct profit, is yet a most advantageous investment of the public funds." People on the Continent, who are accustomed to their Government meddling in or directing up any kind of business which may seem to be desirable, would accept such a theory. Indeed they dare to do so otherwise. But people in Cornwall or Northumbria, who have not the wide views of foreign theorists, would object to the payment of a large sum, however small, in order to enable those who have business in London to reach Golders Green in a brief time. They would say, and with reason, if Londoners have obtained additional facilities, let them pay for them by an increase of fares. Those who profit by the creation of new business in or about Golders Green should also contribute towards the cost. But it would be an injustice that Northumbria should assist in the support of the line on the same scale as the people of Middlesex.

The opening out of new districts offers opportunities to architects and builders. But they are not so minded enough to desire that irregular means should be adopted to gain for them commissions or contracts. The charges on railways as on other things should be proportionate to the services rendered, and a passenger who gains time by using the tube should be prepared to pay as much for the convenience as he was accustomed to pay for a slower mode of carriage. In such cases it is not to be expected that money as a time should be saved.

The recommendation of the municipal engineers for a closer relation to the interest of our readers. Our roads have become inconvenient because, in the past, when they were first laid out, there was no thought of motor traffic. If that mode of travelling ceased to be a fast one, quickly as it became one the roads would serve as well as before. It is not only increased width for the cars which is required, but householders along the roads would desire to have margins which would absorb the noise and malodours of temporary poisoning of the atmosphere. They have as much right to be consulted in any new scheme as the owners of the cars. Among the latter would deny that, no matter how easily or how quickly they move, their motors

ad surface more than large carriages drawn
ses. In ordinary equity they should be made to
ute to repairs at a higher rate than those who
-fashioned conveyances. If it were possible there
be special tracks laid out for motor-cars, entry
ch would involve the payment of a toll. Car
g has become an important industry, and the
e the means of a new pleasure, to say nothing of
ility. But in such a country as ours that is not
to give the privilege of exemption from pay-
f any losses which are sustained.

one sense the proposal of the municipal engi-
which we assume was inspired by municipal
ties, about the control of building estates so far
es to new roads is the most important. In the
ace, it is an additional interference with what
onsidered to be the "rights of property." The
is expected to succumb to the interests of the
ality, and probably in many cases to imaginary
s. Overcrowding is a public danger, and an
ent against the erection of more than a certain
r of houses per acre would be a preventive of
l. But owners and lessees of land will, of
oppose such a proposition. They generally take
age of circumstances in each case, and if detached
are needed they are not likely to erect terraces
all houses. Such men are also acquainted with
hich gain approval with the public. They know
a desire for roads which will display houses to
age, which in a great many places are now laid
a much larger scale than formerly. Indeed,
oads and "avenues" with sounding names are
en which are weedgrown because enterprising
as are not forthcoming to take advantage of those
sites. It is to be hoped the municipal authorities
eager in their desire to regulate and control the
ig of new roads to have the direction fixed in
veyor's office. To perform that kind of work
require special assistance, not easily to be found
rate, or qualifications in the surveyor which
it within the scope of his office when appointed.
s now desirable in laying out roads is more than
venience.

le it is satisfactory to recognise the least effort
the improvement of large and small towns, it
not be overlooked that many of the proposals
ly to be considered as tending to a revolution,
consequence the minds of many people will be
td. If State-supported railways carry people to
ce, it is unwise to erect buildings in the streets
s. The widening and maintenance of streets,
g to Sir EDGAR SPEYER, can be avoided if
are constructed. To purchase land with the
f converting it into a building estate is also
or there is no knowing what powers will be
ed by the local authority, and which may nullify
er's intentions. Capital is the most susceptible
ings, and unless project-mongers exercise more
it may be diverted to uses which are less profit-
in building when carried out under ordinary
as.

ÆGINETAN SCULPTURE.

ometimes of use to recall official blunders, and
which is memorable in connection with art
neglect to purchase the sculpture which was
the island of Ægina, and for which the eligible
s the British Museum. Among the discoverers
ers of the treasure was the late CHARLES R.
ELL, and on that account the case possesses
n usual interest for architects.

island of Ægina is about twenty miles distant
e Piræus, which is the port of Athens. There
ny legends associated with its history which
ve given it importance in the eyes of the
s. But the Athenians were jealous of its naval

strength, and in consequence it suffered. The capital
of the island was visited by PAUSANIAS, and he mentions
the existence of a school of sculpture of which the
products were different in treatment to those of the
other schools.

In 1805 EDWARD DODWELL visited Ægina, for the
capital town in a Grecian island bore the same name
as the island. He found two imperfect Doric columns
which he imagined to be part of the Temple of Venus.
But the principal ruins were those of the Temple of
Jupiter Panhellenios, to the study of which he devoted
no less than three days. Next to that of Corinth it
was supposed to be the most ancient in Greece. No
ruin, he says, was more picturesque. But the site was
overgrown with bushes and the interior was obstructed
with large blocks of stone. The trees were afterwards
removed, which allowed the architecture to be fully
revealed. According to DODWELL the temple was built
with a soft porous stone and coated with a thin stucco.
The architrave and cornice were painted. Most of the
columns were composed of several frusta, but some
of the shafts were of a single block. In 1811 C. R.
COCKERELL and his friend GEORGE FOSTER arrived, to-
gether with two Germans, the Baron HALLER and Herr
LINCKH. They at once commenced the removal of the
rubbish accumulated during centuries about the temple.
After three weeks work they were rewarded with the
discovery of an unique collection of sculpture. The
whole of the figures, eleven in number, which adorned
the eastern pediment came to light, together with five
figures from the western pediment.

COCKERELL sent an account of the discovery and a
description of the figures to his father in London. His
letter was read at a meeting of the Dilettanti
Society, when Lord HARDWICK undertook to recom-
mend to his fellow trustees of the British Museum
to obtain authority from the Government to offer
6,000*l.* for the sculpture. Unfortunately the Govern-
ment, or rather their agents, would not venture
on an offer in a business-like way. It was stipu-
lated that if the sculpture was not approved it was
to be again exported, but free of duty. The conditions
were, of course, rejected by the four owners, for it was
impossible to tell what would be the fate of their pro-
perty. They decided to have a public sale of the pieces
in November at Malta. The trustees of the British
Museum became alarmed when they heard of the
arrangement, and despatched COOMBS, their superin-
tendent of antiquities, with authority to bid up to
8,000*l.* if necessary. He waited in Malta until the end
of November, but as there was no sign of a sale he
retired, leaving his commission with the Governor of
the island. Meanwhile the Prince Royal of BAVARIA,
who realised the importance of such examples, found no
difficulty in purchasing them at Zante, and it is be-
lieved he had not to pay more than 6,000*l.* for both figures
and fragments. Messrs. COCKERELL and FOSTER had
consented to relinquish their share of the purchase
money if the sculpture was secured by England. But
the bungling of the officials made that impossible, for it
is understood they began by offering only 2,000*l.* for a
collection which revealed the existence of a school of
sculpture hitherto unknown, and which, moreover,
exemplified the application of sculpture to fill a pedi-
mental space, and the employment of colour and gilding
to heighten the effect of a sculptor's work.

English amateurs had to console themselves by the
belief that the sculpture from Ægina was more curious
than beautiful. As some compensation for the loss the
trustees of the British Museum were enabled to obtain
casts of the figures which will always have to serve as
substitutes. If the Museum possessed the originals we
should then have examples which were almost
sufficient to exemplify the most important phases of
the history of Greek sculpture. The Æginetan, the
Phigelian and the Parthenon marbles would be enough
to suggest the progress as well as the most important
peculiarities of the art.

It was really owing to the exertions of WILLIAM HAMILTON that the country did not also fail to possess the Phigelian marbles. COCKERELL and his party of travellers were the discoverers. He sent drawings of them to London, but the dismal collapse of the negotiations for the Æginetan sculpture convinced amateurs that British officials did not possess sufficient tact or energy to compete with foreigners. An English gentleman offered 6,000*l.*, which was the value set upon them by LUSIERE, but the four discoverers wished to have a public sale, which was considered to be the most straightforward arrangement. HAMILTON appealed to the First Lord of the Treasury, the Chancellor of the Exchequer, and the Colonial Secretary, and having the influence of the Prince Regent to support him he succeeded in obtaining approval of the outlay of 60,000*dols.* or 15,000*l.* He took care to immediately despatch an agent to Corfu, and although the rate of exchange increased the price to 19,000*l.*, all risks were accepted, and the sculpture became English property. The purchase may be said to have made it easier to acquire the still more valuable and extensive collection of Lord ELGIN which he derived from the Parthenon.

At the time of the purchase of the Æginetan sculptures it was considered by some of the Academicians who were consulted that they were allied to Etruscan work. Both are undoubtedly mysterious in their difference from typical Greek work. In our time it is supposed that they were produced by ONATAS or by some sculptor of his school. There are traces of archaic treatment in many parts of the figures which support that belief. By others it is supposed they are in the traditional manner of a Dorian school which exercised influence in Ægina. DODWELL, who saw them soon after their exhumation, considered that, while the Doric severity of the early Æginetan school was diffused throughout, yet there was a correctness in the muscularity which belonged to a later time. What seems most strange to a modern observer is the unmeaning smile on all the faces. It is as marked in the dying warrior as in the central figure of the goddess, and it has not vanished from the dead. It is not easy to explain so misplaced a manifestation of pleasure, although there is a resemblance to it in some of the earliest work of the Greeks. The figures were all painted, and as the action was supposed to take place in the open air the background was painted blue. The sculpture on the western pediment is assumed to be a representation of the death of PATROCLUS, the Trojans appearing on one side with the Greeks on another, while ATHENÉ presides over the combat. In one of the angles of the eastern pediment HERCULES is shown as an archer, and appears to be endeavouring to rescue his companion, who was the son of the King of ÆGINA. Both are examples of the observance of rigorous laws of symmetry. Although conventionalism had to be recognised, the sculptors were more disposed to give preference to realism. It is the combination of two manners which imparts the peculiarity to the group and allies the figures with archaic Greek and also with Etruscan work.

It is to be regretted that the sculpture has not an honoured position in the British Museum. But it may be some extenuation of the blundering if we remember that the officials were without experience in purchasing on a large scale. Besides it was architectural sculpture, and there was no certainty it would be appreciated by the public. The Townley Collection, which was bought a few years earlier, was of a varied kind which visitors to the Museum could understand without much difficulty. There is no likelihood that another opportunity of purchasing important architectural sculpture can arise. If found in Greece, Italy, or Egypt, the figures would be retained. But the Ægina case should be remembered as a warning against delay whenever there is a chance of obtaining a valuable example of art at a reasonable price.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

A MEETING of the Institute of Architects was held Monday evening last at Conduit Street, W., Mr. Colclutt, president, in the chair.

MR. ALEXANDER GRAHAM (hon. secretary) announced the decease of John Charles Traylen, who was elected associate in 1882.

The Royal Gold Medal.—Presentation to Mr. John Belcher, A.R.A.

The PRESIDENT said:—Ladies and gentlemen,—with very great pleasure that I find myself presiding on such an auspicious occasion as this, the presentation of the Royal Gold Medal to one of our most honoured confreres. The Royal Gold Medal was instituted by Queen Victoria for the promotion of architecture, and I venture to say has never been more worthily bestowed than upon John Belcher, A.R.A., who has done so much to advance our art, not only in his buildings, but also in his public works, and in saying this I feel sure I am expressing sentiments not only of our profession, but of the architectural world generally. In the selection of the name for this year presented to His Majesty the Council have done honour to their own judgment no less than they have done honour to Mr. Belcher. With regard to Mr. Belcher's career, I cannot do better than quote from the *Architectural Review* of September 1898, wherein you will find an interesting record and review of his work:—"Article after article his father, Mr. Belcher brought to the beginning of his career the knowledge he had gained as a boy in London, where he had been sent to study and sketch, with particular instructions to pay special attention to the Renaissance as understood in France. For some years after that he worked in partnership with his father, but, when the latter retired, the subject of this record and review, to quote his own words, 'After swallowing Street's "Academy of Architecture," forthwith proceeded on a wild Gothic career.' A deal has happened since then, and he has long since ceased to be influenced by the words or works of such masters as Street or the other bright particular stars of the Gothic revival." I have a dim recollection that Mr. Belcher's tendencies were towards a phase of Gothic architecture, but he appears to have quickly discovered that his real inclinations lay in another direction. He very soon seems to have fulfilled the prophecy of his father, who, when he found his son being influenced by the Gothic revival, exclaimed, 'He will soon come back to what I have taught you.' His son is so well known to members of the Institute that it is unnecessary for me to give a detailed account of his achievements, but it will doubtless be of interest if I give a short summary of his more important buildings. Among these are:—New lower hall and stables, Stowell Park; Northleigh; Institute of Chartered Accountants; Coldstream Town Hall; houses, Chiswick Mall; house and stables, Holcombe, Chatham; Bearroc, a mansion, Berkhamstead; Electra House, Moorgate Street; Winchester House, exterior; Cornbury Park Mansion; Tapesley Park, Marlborough; Lancaster Memorial. The works that are perhaps best known to most of you are the great building in Moorgate Street, Electra House, and the building in which the Society of Accountants find their home. Electra House is broad, imposing and masculine in its treatment, though showing great beauty and delicacy of detail. The building of the Institute of Chartered Accountants is the work that perhaps impresses the artistic public more than any other; it is treated with great originality, the interior no less than the exterior. The judicious use of sculpture and painting is nowhere more successfully shown than here. The building is, in fact, a standing monument to the happy results that can be attained by the sympathetic collaboration of the architect, sculptor and painter. Unfortunately this fine work is hidden away in back streets, crowded in by ordinary warehouse architecture, but so rounded as it is by mediocrity, "it shines like a good light in a naughty world." It is peculiarly fitting that one who has so greatly distinguished himself in English Renaissance architecture in these later days should have erected his greatest work in the city where the earliest masterpieces of that style are to be found. Mr. Belcher was elected as Associate of the Royal Academy in the year 1900. I think I may say that the whole profession was unanimous in the feeling that this distinction could not have been better bestowed. It was a very arduous duty of presiding at the meeting of the International Congress held in London in last July, undertaken by him as president. He also delivered

interesting paper on "The Education of the Public in Architecture." It must be fresh in your memories how admirably he filled this onerous position, and with what indefatigable ardour he threw himself into the task of rendering the Congress a success. I do not remember that Mr. Belcher was thanked by the Institute for the valuable services he rendered, but I take this opportunity of saying that I feel we are all most deeply indebted to him. Mr. Belcher has won deserved recognition by the valuable literary services he has rendered to architecture, but however much we may value these services, it must not be forgotten that the Gold Medal is presented to him solely on the distinguished merit of his building work. In collaboration with Mr. Mervyn Macartney he published most exhaustive volumes on English Renaissance. I think there is no doubt that the study of this book has had a very beneficial influence on the more recent attempts in architecture of this style. In making the necessary studies for this important work we may surmise that Mr. Belcher was confirmed in his sympathies for that style in which he now practises so successfully. Mr. Belcher's most recent book, "Essentials in Architecture," can hardly yet be known to many of you, as it is only just published. It is dedicated to this Institute in acknowledgment of their desire to stimulate a popular interest in architecture. I am fortunate in already having had the opportunity of becoming acquainted with its excellences. It is written in a very simple and convincing manner, and the undue use of technical terms is avoided. It will certainly appeal very strongly not only to the architectural student, but also to the general public, to whom, indeed, it is chiefly addressed. We have long felt the need of such a work, and we hope it will influence the revival of an intelligent study and appreciation of our art. Mr. Belcher is to be warmly congratulated on the able manner in which he has supplied this want.

The PRESIDENT, addressing Mr. Belcher, concluded:—"We look upon you, sir, as one of those who are successfully carrying on the great traditions of English architecture. It is with the greatest pleasure and sincerest regard that I now invest you with His Gracious Majesty's Gold Medal, and you may be assured that all your brethren delight in the honour conferred upon you, and hope to see many more noble works from your hands."

Mr. BELCHER, in his reply, said:—It is with very conflicting emotions that I rise to express my sense of the great honour that is done me this evening. Your kind words, Mr. President, I very much appreciate, and I am grateful to you also, ladies and gentlemen, for the cordial way in which you have signified your endorsement of those words. The fact that this Gold Medal, bestowed by His Majesty the King, is awarded on the recommendation of my colleagues in the profession adds immensely to its significance and value. I have ever sought to serve the highest interests of architecture, and this proof and token of my brother architects' regard is most welcome. But I am overwhelmed with confusion when I call to mind—and it is so easy to call to mind—the names of many great architects, both at home and abroad, who are far more deserving of this great distinction than I am. As regards many, if not most, of these I am able to console myself with the thought that they are younger than I am, and I may hope to have many an opportunity of being here to see such honoured with the Blue Riband of the profession. But even so, allowing the consideration that this Gold Medal is awarded annually to have its full weight, the sense of my own defects and limitations is strong upon me; but the way in which the President has made the best of the material at his disposal leads me to hope that you may give me credit for some at least of the virtues and good works he has ascribed to me. You have encouraged me to believe, Mr. President—and I am sincerely grateful for the encouragement—that if my work has not been large or extensive in area, at least its quality is appreciated, and that it has been fruitful of suggestion to younger members of the profession who are devoting themselves to carrying on that elastic form of Renaissance work which is now becoming so popular. I have always aspired to do really good work, and particularly work which should embrace and include in its scope the sister arts of sculpture and painting, and you almost persuade me, Mr. President, that I have not laboured in vain. If, indeed, I have achieved success in this respect, let me acknowledge at once my indebtedness to my association with so many great sculptors; such, for instance, as my old friend Mr. Hamo Thornycroft, also Mr. Harry Bates, Mr. Geo. Frampton, Mr. Goscombe John, Mr. Drury, Mr.

Pomeroy, Mr. Bertram Mackennal and others, all of whom at one time or another have lent their aid in giving expression and artistic embellishment to my buildings. But let me assure you also that I have been most fortunate in the men who have been associated with me in the carrying out of my work—men of ability and enthusiasm, responsive to the call of art in its highest forms, kindred spirits with whom I have spent many happy hours and passed through some thrilling experiences of the kind familiar, no doubt, to all who work in an architect's office. Amongst the earliest of my friends was Mr. James Walter James, whose remarkable powers of organisation proved invaluable in the introduction and ordering of business methods in my office. Then came Mr. (now Professor) Beresford Pite, of whose strong personality and versatile genius there is but little need to remind you. I think it was while he was still with me that he won the Soane Medallion with his celebrated design of a Mediæval West End club. Since then he has surpassed us all in the beauty of his Renaissance designs, and is, too, a distinguished exponent of the pure and refined methods of Greek architecture. Professor Harry Wilson, of South Kensington, now distinguished not only in architecture, but as a painter, sculptor and worker in metals, was also with me for a time, leaving me, in the first instance, to join my old and sincere friend Sedding. Professor Reilly, of Liverpool, was not long in my office, but long enough, I hope and believe, to have enjoyed some of the work we had in hand then. Besides these three professors there are many others I could name who have won distinction, such as Needham Wilson (Institute Medallist 1884 and Soane Medallist 1886); Thomas Phillips Figgis; Hubert Corlette (Owen Jones Student 1896 and Institute Medallist 1899); also Messrs. James Fulton, James Charles Cook, James Scott, Balfour Paul, Lionel Detmar, Curtis Green, Herbert Ibberson, George Malcolm and others. Many of my pupils also have done credit to their sojourn in my office. Messrs. Philip Johnston, Alexander Hennell (Tite Prizeman), William Chadwick (now in South Africa), T. H. Russell and Maberly Smith and others. Then there is my present loyal and efficient staff, every member of which I appreciate; and last of all, one who is a host in himself, my trusty friend and partner, John James Joass (Pugin Student 1892, and Owen Jones Prizeman 1895). I may say we are so thoroughly in sympathy that my burdens are lightened by his efficient aid. These have all been real friends and true fellow-workers, and one of the happiest occasions in my life was when recently all the members of my staff, both past and present, met to entertain me at dinner during my term of office as President of this Institute—a token of their esteem and affection which was, as you may easily imagine, most gratifying to me. An architect may well count himself happy when he is loyally supported by men who know and lend themselves to his methods, even when they regard them as peculiarities, or even weaknesses. The last-named, the weaknesses, are especially open to the quantity surveyor, and I esteem myself fortunate in the services in this capacity of so able and so conscientious a man as Mr. Gleed, with whom my younger brother, Mr. Arthur Belcher, having very wisely devoted himself to this lucrative branch of the profession, is in partnership. Then there are the builders, to whom I am greatly indebted for the careful attention paid to my wishes and directions, notably Messrs. Colls & Sons, who have carried out so many of my City buildings in the perfect manner for which they are justly noted. Amongst the hosts of individual workers, craftsmen and others whose skill has been so faithfully employed in my service, I must mention by name my old friend Mr. Brindley, if only to acknowledge how much I have learnt from him. We all know Mr. Brindley as one of the greatest of living authorities on the different kinds of marble and their right use, but I know also how true is his love of art generally, and how good his judgment in all that pertains to his craft. It is of great consequence to an architect that his associates should be such as can interpret and carry out his work sympathetically and intelligently. The architect has been likened to a general directing the operations of an army of workers; but to my thinking a happier and more suggestive comparison is that of the conductor of an orchestra leading and directing the executants in the interpretation of a work of his own composition. I prefer this because, as I understand the art of war, even in these scientific days the vast majority of the units engaged are mere machines, whereas the architect, like the conductor of the orchestra, has to do with many minds. The various musical instruments in

their sensitiveness and capacity of expression are responsive to the mind of the performer, and the musician has not only to understand the powers and limitations of each that he may build up his harmonies correctly, but if he would himself conduct the orchestra there must be mutual confidence and a sympathetic understanding between him and the executants. Only thus will he be able to secure a proper balance and proportion, a right tone or colour, and such subordination of one part to another as will constitute the whole a perfect work of art. The executants, of course, must one and all be of the very best. A single incapable or ineffective unit may spell disaster to an army; the disaster is certain and inevitable if there be a single weak or faulty performer in the rendering of a musical composition. The architect may well address his subordinates in the words which Pericles is said to have used to Phidias and other artists at Athens:—"O ye who expect me to undertake great works, zealously prepare yourselves and harbour no inert self-confidence. None whose hands are not experienced and on whom Athene has not looked kindly will ever be employed by me." It is obvious also that the more frequently the same men work together, the more thoroughly will they understand one another and adapt themselves each to his part in its relation to the whole. The several workers will acquire confidence in the architect and an intelligent insight into his thoughts and purposes as expressed in his designs. He on his part, gaining confidence in them, will be able to allow a certain amount of freedom of expression to the craftsmen under him, and thus give them a fair opportunity for the exhibition of their powers. Now, more than ever, we want "men, not machines." The architect will not use his fellow-workers as an organist uses the stops of an organ; for the organ is a single instrument controlled by one mind, whereas the architect has to deal with a full orchestra of minds, all working together to one end, viz. the interpretation and expression of the architect's designs. The more perfect and sensitive this combination is, the more closely will the accomplishment of the work approximate to the ideal. The organ, wonderful and perfect as the king of musical instruments, is not a true type of the architect's work, but of the painter's, the various stops being employed, like the pigments of the artist, to obtain colour effects. As regards the work of the painter and the sculptor, I have always contended and struggled for the collaboration of these with the architect, even in the days when such an idea was regarded as quite utopian. I am glad I have lived to see the arts drawing closer together and even now working in unity. It is the architect who is (or should be) in a position to bring about this combination, which in its completeness is the most powerful that can be attained. The building which shelters and provides scope for the art of the painter and sculptor is the work of the architect, and it is his to furnish the opportunities and the settings and to determine the subjects of the joint work. In all cases the artists should work together *ab initio*—in the case of a building under the leadership of the architect; in the case of a monument under that of the sculptor; and in the case of a gallery or other place for the exhibition of his art under that of the painter. This is quite a different thing from the mere (and sometimes casual) providing space or place for the independent exhibition of works of art. The true collaboration of the arts leads to far higher and nobler results than the haphazard kind of arrangement that has so long prevailed, and I trust that the day is not far distant when the students of the various arts will be more completely organised and associated than they are at present, and will be set to work out problems together, and together accomplish noble works in which they can join hands and hearts.

Ladies and gentlemen and colleagues, I trust you will pardon these somewhat lengthy remarks, and let me assure you that I am grateful for the hearty and encouraging reception you have accorded me, not only now, but always—a kindness which will ever remain graven deep on my heart.

The President announced that the next meeting would be held on Tuesday, July 2, and the proceedings terminated.

The Commission for the statue of the late Sir Daniel Dixon has been given to Mr. W. H. Thornycroft, R.A., who has undertaken to carry out the work in two years. The statue will be set up in Belfast.

THE SOCIETY OF ARCHITECTS.

BY invitation of Mr. H. W. Matthews, a local member, a party representing the Society of Architects met at Bath on the 13th inst. About sixty members attended. According to the account in the *Bath Herald*, Lacock Abbey was first visited, where, in the absence of Sir John Dickson-Poynder, they were received by his steward, Mr. J. S. Corbett. He announced that he hoped in a short space of time to start a small private company, composed of workmen, who would carve stones for garden ornaments, the Bath freestone being most suitable for that purpose. It would not only increase the earnings of the banker masons engaged, but increase the output, and generally conduce to the prosperity of the neighbourhood. In order to inspect the principal quarries of the locality the party was subdivided into three, one proceeding to the Bath Stone Firms' Company's quarry at Monk's Park, another to the Hartham Park quarries of Messrs. Marsh, Son & Gibbs, and a third to the quarries of Messrs. Yockney & Co. A fourth stone quarry was mentioned in the programme, that of the Corsham Quarrying Company, whose managing partner, Mr. H. J. Lucas, was present, but in the end time did not permit of more than a surface inspection in this case. For the visit to the Bath Stone Firms' quarry Mr. T. Sturge-Cotterell was the guide; at Messrs. Marsh, Son & Gibbs's three directors were present—Messrs. F. H. Gibbs, H. P. Lyle and W. West Mabson—and Mr. Yockney himself was at the head of the third party.

The party at the Monk's Park quarry were singularly fortunate in arriving at the precise moment when a very fine 10-ton block was being removed by the crane. The technical experts present were able to see at Messrs. Marsh, Son & Gibbs's another fine specimen piece of 7 tons weight. In the latter the perpendicular shaft, lined with moss and studded with ferns, which is still used for raising stone, was inspected with much interest, and wherever they went the party learned much of the methods of winning the world-famous constructive material, and heard with amazement the evidence of the inexhaustibility of the supply.

To most of the visitors the exploration was a complete education, for some were even under the impression that the stone is always obtained from the surface of the ground. The negotiating of from 100 to 150 steps down the incline of 70 to 100 feet in depth at the different quarries completely removed that misapprehension. Opportunity was also taken to dispense some of the prejudices which exist about Bath stone. There is only one system of extracting the Bath freestone in all the rival quarries, and this has been described as an inversion of the method of working coal. The coal miner undercuts, so that the mass may fall and break; the quarryman has to commence his operations at the roof by picking with an adze-shaped pick. Afterwards a one-handed saw is used to separate laterally the block that is being removed from the parent rock, and by the introduction of levers, which are weighted and shaken as necessary, the block is forcibly detached at the back and removed by a crane, the broken end being dressed with the axe. Once the first block is removed there is access for the quarrymen by means of the opening that has been made to the back of the bank of stone, and they are, therefore, able to use the saw transversely, and to separate the block from its back or hinder attachment so as to render all further breaking off unnecessary.

The three parties having completed the different inspections arrived by instalments at Monk's House, under which some of them had actually been walking in the Monk's Park quarry. Here Sir John and Lady Goldney gave each visitor a personal and cordial welcome, and tea was served in the billiard-room. The house has its traces of "Adam's" work, and was therefore full of interest. A delightful drive to Bath was taken *via* Box Hill, but on the way a brief halt was made at Corsham Court, which was inspected externally together with the church.

On the next day there was a partial inspection of some of the places of interest in the city. The architects were abroad soon after 10 A.M., spending an interesting hour at the Pump-room and the baths, ancient and modern, Mr. L. H. Wilson, the manager, and Mr. A. J. Taylor, architect, being there to receive them. Vehicles were afterwards engaged, and under the guidance of Mr. H. W. Matthews, Mr. S. S. Reay and Mr. R. E. Brinkworth a comprehensive drive was taken, concluding at the Art Gallery, and resumed after luncheon at headquarters for Beechen Cliff and Combe Down. In the early evening the mayor (Mr.

S. W. Bush) held an "At home" at the Roman Promenade, and invited to meet the visitors a number of citizens, including the members of the Corporation and all local architects.

At the service in the Abbey on the Sunday which the members attended, the Rev. Prebendary Boyd preached. He referred to the dignity of architecture. It was dignified, first, because of the strength and purpose of building. We had in this country the remains of Roman walls that had stood for certainly 1,500 years, or they might go to Rome and see there mighty structures which had stood for 2,000 years. They looked at those things with just awe and reverence. Architecture was, in the next place, a dignified art—the expression of noble ideas. While it was expressive of individual genius, of course it was expressive, and highly so, of national character. Instances were cited of characteristic Grecian and Roman architecture, and the preacher said architecture was powerful in expressing religious belief. The Grecian temple was said to be an expression of religious belief, and it was remarked as being notable that when the Romans, whom perhaps they did not wrongly think of as being more materialistic, came to rear their temples, they borrowed from the Greek. Architecture was a dignified art, too, because of its power of influencing men. Christian architecture inspired reverence and tended to provoke aspiration and noble effort. They might try these assertions that architecture was a dignified art by thinking of the great regard that was entertained for public structures in this land. In viewing their own cathedral at Wells everybody must feel the noble ideas that were embodied there, and no one could see it without having many emotions affected, and so their earnest hope was that those to whom was entrusted the work of carrying out the architecture of the day might always maintain the highest ideals and repel vigorously and successfully all those influences that would be hurtful. Painting and sculpture were open to these influences also, but in addition, in the case of architecture there were the considerations, perfectly right, indeed necessary, but to be held in their proper place, of convenience and utility. They wanted these considerations to be redeemed and transfigured by the touch of serious purpose. A noble art to be nobly pursued.

Some of the members visited Glastonbury and Wells in the afternoon. They were accompanied over the cathedral by Canon Church.

A public dinner was held at the Empire Hotel. Mr. A. E. Pridmore presided. In proposing "Success and continued prosperity to the ancient city of Bath," he expressed the hope that their excellent building material would be used in abundance when the building trade was in a better condition than it was to-day. They would go away with a grateful recollection of the kindness they had received, and would not fail to proclaim the city's attractions. They greatly appreciated the hard work of Mr. H. W. Matthews, their local friend and member, who had assisted their secretary in London and arranged a programme all had enjoyed.

The Mayor responded. He said he knew that the tendency was nowadays to allow considerations of economy to hamper the freedom of architects, and he hoped they would always seek to induce their clients to hand over their bank-books and to have such implicit confidence in their integrity, their honour and their genius that they would gladly pay for what they erected.

Mr. D. Maclean, M.P., also replied, and promised his support to the Registration Bill.

Mr. G. P. Gooch, M.P., proposed "The Society of Architects." He said that heaps of societies had got Bills which they wanted to get through, and some of them had been waiting even longer than had the Society of Architects. The lesson was not to despair, but to go on influencing those who had influence, and it might not be long before their Bill found itself on the statute book. At any rate, they had the good wishes of the members for Bath, because, as he understood the matter, it was one of simple justice and common sense.

The President expressed heartfelt thanks to Mr. Matthews for the trouble he had taken in making the arrangements which had been so successful, and as a mark of their appreciation asked his acceptance of a silver christening cup for the infant daughter whose baptism had been observed during the stay of the Society in Bath.

Mr. Matthews replied, associating Mr. Cotterell and his professional colleagues in the city generally who had assisted him with the success which had been achieved.

THE VICTORIA MEMORIAL, WINCHESTER.

THE group and enthroned figure of the late beloved Queen Victoria on the Abbey Grounds, Winchester, which Mr. Gilbert never finished, has, as we have often noted in our columns, says the *Hampshire Advertiser*, had many vicissitudes—its removals and its joint ownership. Intended to be canopied by the fine old hall of the Norman and Plantagenet kings, it was first placed out of doors on Castle Hill, in a mere courtyard of the Assize Courts, and this treatment of the fine work of art in bronze displeased alike the donor, the late Mr. Whittaker, high sheriff of Hants in the Jubilee year, which it commemorates, and the accomplished academician and sculptor. It was moved to the Abbey grounds by the Hants County Council and to the custody of the Winchester Corporation, and all that was required was a canopy. This adjunct is now in a fair way of attainment, provided the funds are obtained. The difficulties of design and approval have been surmounted by that enthusiastic and accomplished artist and veteran, the Rev. G. A. Seymour, of Winchester, whose drawing of a canopy in the Græco-Roman style has received the approbation of the President of the Royal Academy and other connoisseurs and of the County Council, who have consented to the scheme. Mr. Seymour informs us that Mr. Ambrose Poynter, son of Sir Edward Poynter, P.R.A., has written, "I am prepared to make the necessary architectural drawing in accordance with the general lines of the scheme proposed by you." That the reverend gentleman's design has met with such high testimonies of excellence speaks volumes for his artistic ability and taste, and we hope he will be spared to see a fruition of his strenuous efforts to have this splendid group completed at our local memorial of the late queen, who was a Hampshire resident for so many years, and many of whose Saxon predecessors are inhumed and enshrined in this city. The next step is monetary and voluntary; about 1,800*l.* is required, and this sum, it may be hoped, will be speedily forthcoming.

PERTH CITY HALL.

SOME time ago Mr. J. J. Burnet, A.R.S.A., architect, Glasgow, was appointed by Perth Town Council to examine the city hall and its foundations and to report as to suitability for reconstruction, or whether a new hall was advisable. His report has just been received. Having detailed the position of matters and pointed out that with one exception the entrance and exits were all on one side of the building, and that in case of fire in that portion the audience would have but one means of egress—the gallery fire door in the south gable—Mr. Burnet says that after most careful consideration he has come to the conclusion (1) that the present hall buildings are quite inadequate both as a hall and in respect of the modern adjuncts to a hall for such a city as Perth; (2) that as the present walls are dilapidated, it is highly inadvisable that any portion whatever of the existing structure shall be incorporated in any scheme of reconstruction, and consequently (3) an entirely new building is necessary. In considering a scheme for a new town hall he submitted block plans suggesting the formation of streets on the north and south sides. He is of opinion that a creditable hall of simple design without a tower could be erected for 20,000*l.* The tower might cost from 3,000*l.* to 4,000*l.* In his plans he had taken the hall to accommodate 2,500, of which at least 1,000 would be in the gallery and platform. Had he felt at liberty to suggest any other site he would have preferred to make the hall buildings part of the same block as the present municipal buildings, either at the corner of High Street and George Street or facing the river in Tay Street, but he inferred that the Council had decided that King Edward Street was the proper site, and had therefore endeavoured to outline a scheme for buildings there separate from the municipal buildings. They might be less convenient on civic ceremonial occasions, but would still be dignified and worthy of the beautiful city of Perth.

Mr. C. Mawson, head-master of the Shipley School of Art and director of the local museum, has been selected, out of a large number of applicants, as head-master of the Warrington School of Art, in succession to Mr. C. B. Aylward, who has held the post for many years and is about to retire.

NOTES AND COMMENTS.

WHEN one reads the account of the Fleet River, and of such approaches to it as Breakneck Stairs, one is gratified that it is no longer visible. But Paris still possesses a Fleet in the Bièvre. For over thirty years, or, in other words, since sanitation was considered worth scientific attention, the little river has been condemned. An occasional English visitor to the Gobelins may have the courage to look out for it, and students of painting in search of the picturesque sometimes utilise it for a subject. It is bounded by many of those tumble-down houses which in most places are found wherever tanners or skin-dressers and dryers follow their occupation. The water, or the fluid which passes by that name, is continually varying in colour, according to the refuse poured into it. It is now again proposed to conceal the Bièvre by covering it. But for that purpose it will be necessary to come to agreement with the owners of various establishments along the sides, for whom it serves the purposes of a sewer. Twenty-eight out of ninety-one are opposed to any change. It is one of the blots of Paris which the Municipal Council avoid when they are conducting foreign visitors through the city. Vanity may be more influential than sanitation, and it is now believed that if the Bièvre is allowed to sluggishly pass into the Seine it will be beneath the close covering of masonry.

FOR painters of costume, archæologists and designers the exhibition of the Golden Fleece which was opened in Bruges on Tuesday will be attractive. The Order was founded in the old city on the occasion of the marriage of the Duke of BURGUNDY with ISABELLA of Portugal in 1430. The King of SPAIN, who is the sovereign of the Order, has taken great interest in the exhibition, while the Emperor of AUSTRIA and the King of the BELGIANS have also co-operated. We need not say how distinguished the Order has been, for the Duke of WELLINGTON set greater value on the golden badge than on any of his decorations, and on some occasions he wore it alone. The exhibition is intended mainly to exemplify the history of the Order from 1430 to 1598. Portraits of the sovereigns and of the chevaliers, insignias of the chapters, illuminated manuscripts and representations of ceremonies have been brought together for the first time. From Paris forty-four miniatures by JEHAN FOUCQUET have been contributed. The Emperor of AUSTRIA has lent costumes and gold plate. The King of SPAIN has not only contributed a collection of various things relating to the Order, but he has lent a dozen of his halberdiers, who are to remain in Bruges until the close of the exhibition in September.

ILLUSTRATIONS.

VICTORIA AND ALBERT MUSEUM, SOUTH KENSINGTON.

THE public will shortly be able to see the whole frontage of the South Kensington Museum without any obstruction to the view. The masonry which Messrs. HOLLOWAY & GREENWOOD have executed will sustain close examination. The Portland stone employed has been derived from the Coombe Down Quarries at Portland, belonging to the Bath Stone Firms, Ltd. The total quantity supplied was about 16,800 tons.

HENLEY HOUSE AND THE HOMESTEAD, GREAT MISSENDEN, BUCKS.

THESE two houses have been built for Mr. ALFRED DUNHILL, stand on a branch of the Chiltern Hills near Great Missenden, Bucks, and have extensive views of the surrounding country. They contain respectively morning-room, dining-room, drawing-room, kitchen and usual offices, and four and six bedrooms.

In Henley House a feature has been made of the staircase window, which also lights the entrance hall. This window shows in lower gable on front elevation, inside the ceiling follows curve of window, and shelves are arranged at each side for curios, &c.

The walls are of brick covered with rough-cast outside and whitened, and the roofs are covered with Bedfordshire hand-made tiles. All windows are of the casement type painted white; the frames, as also all outside wood and ironwork, are painted green.

The architect was Mr. J. BRUCE MERSON, of 17 St. Swithin's Lane, London, E.C., and the contractors were Messrs. ALDRIDGE, of Willesden.

PLAN OF CARLISLE CATHEDRAL.

HOUSE AT BEZING, BASSES PYRENEES, FRANCE.

THIS house was erected at Bezing, a village about thirteen miles from Pau, at the foot of the Pyrenees, for Dr. EDWARDS, of Pau. The basement was formed of rough stones and cement. The stones were taken from the river Gave running at the foot of the grounds. This part of the house was erected by a local French builder. The whole of the woodwork for the upper portion was sent out from England and erected by English workmen sent out to the site. The elevations illustrated face east and south and have an uninterrupted view of the Pyrenees. The chief feature is the verandah running round three sides of the house. This affords an excellent shelter from the fierce sun in the summer, and keeps the house warm in winter and protects it from the prevalent winds. The architects are Messrs. HAYWARD & MAYNARD, of 20 John Street, Adelphi, W.C.

EXHIBITIONS IN GREAT BRITAIN AND IRELAND SINCE 1890.*

SINCE the publication in the Society's *Journal* of November 8, 1889, of the Memorandum on Exhibitions held in Great Britain and Ireland, which was prepared at the request of the Secretary of State for Foreign Affairs for the use of the committee then occupied in organising the exhibition at Chicago, there have not been many exhibitions held in this country of an important character, or properly entitled to the epithet international.

The largest and most successful was that held in Glasgow in 1901. This resulted in a surplus of over 5,000*l.* One held in the following year at Wolverhampton was less successful, as it resulted in a deficit of about 1,000*l.* This was on a smaller scale than Glasgow. A still smaller exhibition was held at Bradford in the year 1904, which left a surplus of nearly 15,000*l.* A successful exhibition was also held at Cork in 1902, but the surplus over 6,000*l.* was due to the liberality of the subscribers, without whose assistance the exhibition would not have paid its expenses. In 1896 one was held at Cardiff; it had a small balance on the wrong side. Many smaller exhibitions were held at some of the chief centres of industry—Manchester, Liverpool, Bristol, Birmingham, &c. Some of these were of the nature of private speculations, others were promoted by local committees. Most of them may be said to have been popular and successful. In many cases they were certainly profitable to their promoters and beneficial to the local industries.

In London no large exhibitions have been held, though there have been a great number of various characters, particulars of some of which are given a little later on. It is certainly the fact, as far as this country is concerned, that the tendency of late years has been towards exhibitions of a special character dealing with particular trades or industries. These are of necessity small as compared with the large international exhibitions of the past, but they seem on the whole to be regarded as more useful for business purposes by manufacturers and traders than such large exhibitions. They do not necessarily appeal specially to the general public, but they offer useful opportunities for the transaction of business, and, judging from their success, such opportunities are much appreciated and generally utilised.

It must not be forgotten that exhibitions on the scale of Paris, Chicago or St. Louis can only be carried on at a very heavy loss, which loss has to be made good by subscriptions or grants from one source or another. The receipts from the admission of visitors and from the various payments made by those visitors, a large proportion of which of necessity reaches the exhibition coffers, can never be sufficient during the season for which an exhibition is opened to meet the very heavy charges for buildings, installation, &c., when these are on the large scale and of the elaborate character induced by international rivalry. It may be worth while for a country or a city to incur this loss in view of the indirect benefits gained, but it must be regarded as most probable that in the future the occasions on which such indirect benefits will counterbalance the certain loss will be few and far between, though they are quite likely at intervals to recur. It is probable that in the case of Paris the indirect profits to that great city are sufficient to induce the Government to keep up the series of Paris exhibitions, and it would be a matter for regret if the series were not continued, but it is difficult to name any other city which would gain in the same way. A new and rising country, anxious to develop its industries, might be inclined to face the cost of advertising them by an exhibition on the international scale, but so far as careful consideration of the conditions may justify prophecy, it seems unlikely that in the immediate future any of the older countries will be willing to meet the necessary expenditure. It therefore seems reasonable to expect that in the future we shall have a number of smaller exhibitions, of which a considerable proportion will be confined to some special subject, a group of subjects, rather than any of the great international exhibitions of the past.

I.—London Exhibitions.

During the period under consideration there have been in London no important exhibitions of an international character, but it may be useful to put on record some

account of the exhibitions which have been held. The two most important exhibitions held in London during the period 1890-1906 were certainly the Royal Military Exhibition at Chelsea in 1890 and the Royal Naval Exhibition at the same place in 1891. Both of these were extremely successful. They were held on ground belonging to the Chelsea Hospital, an area of about $7\frac{1}{2}$ acres. The exhibits were mainly loans, but trade exhibitors were charged 5*s.* per square foot.

The number of visitors to the Royal Military Exhibition, 1890, was 923,761. The total receipts of this exhibition were a little over 55,000*l.*, of which 36,750*l.* came from admissions and about 9,000*l.* from concessions, sale of space, &c. A little over 6,000*l.* was received from donations. The expenses amounted to over 45,000*l.*, of which 18,500*l.* was for buildings, installation, &c. The surplus was nearly 10,000*l.*

The attendances at the Royal Naval Exhibition, 1891, were much larger—2,351,683. The total receipts were nearly 155,500*l.*; of this admissions accounted for 109,000*l.*, and concessions, space, sale of catalogues, &c., for about 46,500*l.* The expenditure amounted to about 108,500*l.*; of this 36,000*l.* was for buildings, installation, restoration of grounds, &c., 10,700*l.* for entertainments, 6,500*l.* for illuminations. There was a balance of 47,000*l.* The profits from these two exhibitions were devoted to certain military and naval benevolent institutions.

As mentioned in the previous memorandum, a series of exhibitions was started at Earl's Court after the last of the South Kensington exhibitions—the Colonial and Indian Exhibition held in 1886. These have been continued since and have proved very popular and well attended. They are in the hands of a private company, and are believed to have been profitable, the grounds being a very popular place of resort during the summer,* and providing what is much appreciated in London, a place of outdoor recreation under good and careful management. During the same period a number of exhibitions of different characters have been held at the Crystal Palace, Sydenham. These have most of them been of a special character, and though some of them have been termed international, they were none of them genuine international exhibitions.†

At the Imperial Institute several exhibitions have been held, all of them devoted to some special subject. The first of these was in 1894, and dealt with pottery; in the next year (1895) the subject was photography, in 1897 there was a yachting and fisheries exhibition, in 1898 an exhibition of acetylene generators, in 1899 an exhibition of ecclesiastical art, and in 1900 one of English education.

In 1899, at the suggestion of the Society of Arts, the Science and Art Department held an exhibition of lithography to commemorate the invention of lithography by Senefelder in 1798. This was followed by a series of exhibitions of methods of illustration:—1901, illustration by typographical methods; 1903, engraving and etching; 1905, photogravure and other photographic methods. These were international, and included large and representative collections of foreign work.

A small general industrial exhibition was held in the People's Palace, East London, in 1896.

In addition to these were many other smaller exhibitions, and also a number of exhibitions dealing with special subjects, most of which were at the Agricultural Hall or at Olympia. The more important of these dealt with such subjects as tramways and light railways, bicycles, electrical appliances, engineering, motors, building materials, colliery and mining plant, gas, confectionery, furniture, brewers' products, groceries and provisions, tobacco, boots and shoes, &c.

* The present series commenced in 1895, and include the following:—Empire of India Exhibition, 1895; Empire of India and Ceylon Exhibition, 1896; Victorian Era Exhibition, 1897; International Universal Exhibition, 1898; Greater Britain Exhibition, 1899; Woman's Exhibition, 1900; Military Exhibition, 1901; Paris in London Exhibition, 1902; International Fire Exhibition, 1903; Italian Exhibition, 1904; Naval, Shipping and Fisheries Exhibition, 1905; Imperial Royal Austrian Exhibition, 1906.

† The Secretary of the Crystal Palace has kindly furnished the following list of exhibitions held there since 1890:—Photographic, 1890; Mining, 1890; Horticultural, 1891; Photographic, 1891; Electrical, 1892; Photographic, 1893; Sports and Pastimes, 1893; South African, 1895; Horse-drawn and Horseless Carriages, 1896; Imperial Victoria Exhibition, 1897; Photographic, 1898; Article Club, 1899; Music, 1900; Naval and Military, 1901; American, 1902; Engineering and Hardware, 1903; Music, 1903; Food and Grocery, 1903; Indian and Colonial, 1905; Food, Health and Hygiene, 1906; Pianoforte and Music Trades, 1906.

* Prepared at the request of the Board of Trade for the information of the Japanese Government by Sir Henry Truman Wood, secretary of the Society of Arts.

The occasional exhibitions of arts and crafts promoted by a committee formed for the purpose should be mentioned, as affording interesting evidence of the character of and the changes of method in the artistic industries of the country.

II.—Provincial Exhibitions.

Glasgow.—A second exhibition was held at Glasgow in 1901. This, like the previous exhibition of 1888, attracted a very large number of visitors, and was a considerable financial success. The total receipts amounted to 404,105*l.*, of which 283,024*l.* was from admissions, 84,122*l.* from refreshment and other concessions, and 34,923*l.* payments for space. The surplus, as estimated in the published balance sheet, was 30,571*l.* It was expected this would be somewhat increased by the sale of the buildings. The cost of the buildings and grounds was 222,886*l.*, 37,936*l.* was paid for music and entertainments, and there was a women's section costing 1,314*l.* The general administration expenses were given as 51,574*l.* and the engineer's department 36,890*l.* The total number of admissions was 11,559,649. The admission was 1*s.*, children half-price, and during a certain portion of the exhibition the entrance after 5 P.M. was reduced to 6*d.*

Bradford.—In the year 1904 an exhibition was held in Bradford to inaugurate the opening of the Cartwright Memorial Hall, which was presented to the city by Lord Lister. This was not entitled an international exhibition, but there were a few foreign exhibitors. The exhibition was not on a large scale, but it was a distinct financial success. There were in all nearly two million and a half visitors, but this number appears to have included rather more than 40,000 free admissions. The total receipts amounted to 66,114*l.* The expenditure was 51,148*l.*, leaving a surplus of 14,966*l.* This surplus was devoted to the expenses of the Cartwright Memorial Hall—5,000*l.* towards the cost of erection, and 10,000*l.* to the purchase of works of art and furnishings for the hall. The receipts from admissions were 41,828*l.* The amount received in payments for space was 4,551*l.*, the charge to exhibitors being 3*s.* per square foot; 11,688*l.* was received from the various concessions and entertainments.

Wolverhampton.—In 1902 an international exhibition was held at Wolverhampton. Financially, this was unfortunately very far from successful, as it resulted in a deficit of about 34,000*l.*, which had to be met by the guarantors. The total expenditure was about 93,000*l.*—buildings 35,174*l.*, power and light 9,088*l.*, entertainments 13,986*l.*, fine arts 2,000*l.*, advertisements 5,514*l.* The total receipts were about 59,000*l.*—season-tickets 9,117*l.*, admissions 27,000*l.*, sale of space 6,033*l.*, concessions 12,056*l.*

Cork.—An international exhibition was held at Cork in 1902. This resulted in a surplus of 6,179*l.*, but it can hardly be said that this was earned by the exhibition, inasmuch as donations were received amounting to nearly 16,000*l.* The total receipts were 61,519*l.*; the expenditure was 55,340*l.* Besides the amount of donations above mentioned the principal items of receipts included 26,000*l.* admissions, 8,500*l.* sale of space, and various concessions and other receipts 9,500*l.*

The exhibition was reopened in 1903, and a portion of the surplus was carried forward towards the expenses of the second year. The remainder was applied to the purchase of ground for a park.

Cardiff.—A fine art, industrial and maritime exhibition was held in this city in 1896. The exhibition was held in Cathays Park, the use of which was granted by the late Lord Bute for the purpose. The number of admissions amounted to about a million. The expenditure amounted to 31,000*l.*, of which buildings and machinery came to about 15,000*l.* and electric light 3,000*l.* The receipts amounted to rather less than 30,000*l.*, the balance of 1,700*l.* being made up by the guarantors. Of the receipts 22,500*l.* was from admissions and 5,700*l.* from rent of spaces, concessions, &c.

Dublin.—An international exhibition is now being organised in Dublin. The arrangements are now (January 1907) far advanced towards completion, and hold out every promise of success.*

The Huddersfield Town Council have rejected a proposal to extend the technical college at a cost of 3,825*l.* for the purpose of providing special facilities for dyeing.

* Since the date when this memorandum was prepared the exhibition has been opened and is now believed to be pursuing a successful career.

ARCHITECTURAL EXHIBITION, EDINBURGH

THE Architectural Exhibition which has been organised in connection with the jubilee of the Edinburgh Architectural Association was formally opened on the 19th inst. in the galleries of the Royal Scottish Academy. Sir Thomas D. Gibson-Carmichael, Bart. The chair was occupied by Mr. Hippolyte J. Blanc, R.S.A., president of the Association, and the chairman of the exhibition committee. According to the *Scotsman* there was a large representative company present.

The President said he felt that no apology was required for intruding such an exhibition as that upon the group of attractions that claimed a citizen's attention in these busy times. The Edinburgh Architectural Association, in promoting the exhibition, offered as a reason the circumstance of its having reached the fiftieth year of its existence. The fact was not too well recognised by the citizens, probably because, while constant in labour to stimulate a popular interest in architecture, its methods had been rather those of quiet persuasion than of aggressive assertion. It was, however, conscious of having exercised some influence for good; but with the true modesty characteristic of artists it "might blush to find it fame." That they had already marked time during their career of fifty years was evidenced in an exhibition, similar to the present, promoted about twenty-five years ago. The present exhibition differed from its predecessor in respect that it was more comprehensive as regards quantity of material exhibited. The exhibits comprised works of over a period of sixty-seven years, collected from all parts of Scotland. The aim and object of the exhibition were to enlist the public in a more intelligent understanding of architecture, and greater appreciation of the learned profession who made the practice of it their daily occupation. The city could be made—it might also be marred—by its architecture. Happily for us, we could boast a score of men who within the past hundred years have furnished to the city monuments of their genius, models for all time; and if their works were seriously and reverently studied, the genius of their authors would reveal itself in the appropriateness of conception and the studied suitability to situation. For examples they had only to look to the dignified tower of St. Stephen's Church, arresting the slope of the hill from George Street; to Charlotte Square, with its setting of St. George's Church; to St. Andrew Square, with its Royal Bank; to the Bank of Scotland, perched in full view from all parts of the Prince Street mile; to the Free Church, with the fine effect produced by its combination with the spire of the Assembly Hall behind it; to Waterloo Place, with its graceful, elevated porticos guarding the approach; and to the High School, sublimely nestling and staged upon its rocky bank—all these noble examples of thought, academic ability and artistic skill. These were a few of the works which had contributed to the traditional fair fame of our beautiful city. It might be that familiar daily contact with them made us regardless of their merit and teaching. It was to be feared, however, that what had been styled the "Franco-Berber-American" invasion, unless intelligently controlled, might rapidly overwhelm our best thoroughfares, to the destruction of all that was good, true and beautiful. It was confessed by one of the favoured Lord Mayors from England who had been invited to take part in the recent festivities at Lyons that the visit had opened his eyes. He stated that in his city they were not a patch on Lyons in architecture and in matters of art, and that his people treated art in such a way that he wished his councillors might go to Lyons annually to see how things ought to be done. Did we continue the character of such compositions as those to which he had referred we might offer invitations to civic rulers to visit Edinburgh and show them how it had been done here. But, alas! while our civil and municipal architecture were all that could be desired in the treatment of many of the city's extensions, we had, unfortunately, markedly degenerated. In the Dalry and Gorgie districts we had repeated the distortions and slums of the Canongate without the charms of its grand old history, and the confined tortuosity of the Pleasance had found an unfortunate echo in the ill-conditioned Morningside Road. Could not our rulers look ahead and see to it that, where amenity existed, it should not be intruded upon by anything foreign to its original setting, and recognise also that utility and amenity should always and could be associated? If such an exhibition as that helped them to realise more the beauty of our city, in which lay its fortune, and the duty they owed to it, as trustees for posterity.

Mr. Thomas Gibson-Carmichael said he had much pleasure in declaring the exhibition open. He gathered from the remarks of Mr. Blanc that its objects were to raise the interest of the public in architecture and to show the respect in which the public held architects. Mr. Blanc had sent him a newspaper the other day, from which he gathered that the architects of Edinburgh had the reputation that there was a scarcity of large orders for country houses given to Scotland. It might be that there was not so great a demand for country houses as formerly, but he thought that there would be never quite certain what the future would cost. As to the appreciation of architecture by the general public, he did not suppose that at any time in the history of the world, or in any country, was there ever a more complete appreciation of architecture. It was quite possible that the inhabitants of one country, or the people in one town, might have admired, or professed to admire, works of art for these would always appeal to people because of the scientific skill which they required. Mr. Blanc had said that the architecture of Edinburgh had somewhat fallen off during the last fifty years, and that the influences of France, Germany and America might do harm to Princes Street. He did not know, but he was inclined to think that there were a great many lessons to be learned from the architecture of other countries. He believed there was no country in which the appreciation of architecture was greater than in America. So far as he could learn, it was in American towns where there was an immense feeling of pride in their own architecture, where adaptation was most diligently practised. If architecture was to be a flourishing art, a live art, an art which would appeal to the people, it could only be so if the architects showed that they were able to adapt themselves to the latest developments of science. For his part, he was glad to think that the architects of Scotland, or the architects, owed as much to the introduction of turnpikes as to anything else. By the development of agriculture the Scottish people were enabled to employ architects in beautifying their country and to spend the surplus income which they derived from their estates on works of art. That time was, however, past, and people had now to live more in the towns than in the country. The future of architecture, he believed, was in those who could devote themselves to making fine buildings suitable for the towns, and in that way the architects of the future had an infinitely larger public to appeal to than the architects of the past. It seemed to him, therefore, that the thing they ought to be interested in and try to do was to get the people interested in town architecture. He admitted that there was a sad want of interest in the architecture of towns. They had only to look at what had been done in London to realise that. All that laymen like himself could do was to see what beauty there was in a work of art, and to criticise it in a hostile spirit. Mr. Blanc had said that there was a falling off in Edinburgh, and that it was very possibly the case. It was a pity to see structures moved in which they saw beauty, but he was afraid that this was not the only town in which that was done. A man who resided in or near Edinburgh, looking

The wayfarer passing along the high road leading from Carisbrooke to the village of Calbourne sees little of Swainston excepting its woods and broad meadows, and it is only as a matter of special privilege that the members of the Hampshire Field Club are to-day enabled to visit the

house at Swainston. To the archæologist the district we are traversing is of great interest, as hereabouts are to be found evidences pointing to settlements of extreme antiquity. On the downs lying to the southward of Swainston many Anglo-Saxon remains have from time to time been unearthed, and in the British Museum and at other places, and also in the museum at Newport, are to be seen objects of great interest which have been obtained from the burial-places on the chalk hills in this locality. That such settlements took place in this valley to the northward of the hills one may reasonably, and no doubt correctly, infer from the place-name of Swainston itself, which signifies the "tun" or settlement of a "Swain," Sweon or Swede. In this connection it is of importance to note the old spelling of the name "Sweyneston." Our late friend, Mr. T. W. Shore, in his learned work on the "Origin of the Anglo-Saxon Race," deals very fully with the evidences which point to men of Swedish origin having accompanied the Frisians, Jutes and Goths in the colonising of the old kingdom of Wessex, which included the Isle of Wight. Dealing with the migration of the Danes and other tribes from the Baltic coast, he mentions various place-names which clearly have an Anglo-Saxon origin and point to the settlements of Swedish men. Among these are places called Swanesisg, in Berks, and Swanetun, in Norfolk, the latter being almost identical in sound with Swainston, in the Isle of Wight. Mr. Shore says on page 140:—"In searching for traces of Swedes in England we must look for them in proximity to Goths, Norse or Danes, with whom they probably migrated, and look for traces of their names under the names of Sveal, Sweon, Swein, and perhaps Swin." We have a clear trace of Jutish settlement in the place-name of Gatcombe, being the Celtic "cwm," a hollow or valley where dwelt a Gat or Geat, the latter being an ancient name denoting a Goth or Jute. The Goths of Gatcombe and the Swedes of Swainston were settlers who may have come into the island at about the same time and formed their settlements in near proximity, the two places being about $3\frac{1}{2}$ miles apart.

Turning to more recent and historical times we find much interest in recalling the fact that to-day our itinerary takes us along roads which traverse the district where was situated in Norman and later times the royal park attached to the castle of Carisbrooke. Known as Alvington Park, its existence is recorded in the names by which the farms and other places in this valley are still known. Park Cross and Park Place we passed just now when coming from Carisbrooke. New Park Farm, Great Park Farm, North Park Copse, Park Green and Parkhurst are all place-names which record the existence of the park. Amid the fair acres bordering on the western side of the park stood the house of Swainston, but of that older house few traces now remain excepting the very fine old chapel and the hall. Around the old house centre historical associations of an interesting character. Held by the Bishop of Winchester as abbot of the monastery of St. Swithin, the manor of Swainston or Calbourne was, as it were, the centre from which were administered the affairs of the old borough of Francheville, or Newtown, the bishop's free town and port, the manor having been granted to the Bishop of Winchester by King Egbert about the year 826, and the boundaries of the manor, as then constituted, included the town of Francheville. Probably a dwelling of Saxon origin, possibly erected by the earliest settler, existed here at one time, and it gave place to a more important edifice erected in the eleventh century, which again was remodelled by Edward I., who acquired the manor from the then Bishop of Winchester in 1284. In 1285 Edward I. himself came to Swainston, attended by his chancellor and others, and the burgesses of Francheville obtained from him a confirmation of their charter which had been granted by Aymer, Bishop of Winchester, in 1256, and the confirmation of that charter was sealed at Swainston by Edward I. on November 5, 1285. Edward II. granted Swainston to his son, the Earl of Chester (afterwards Edward III.), who, in his turn, granted it to William de Montacute, Earl of Salisbury, from whom it descended to the Earl of Warwick, the king-maker. On the death of the Earl of Warwick the manor came to his son-in-law, the Duke of Clarence, and from him it descended to his daughter Margaret, the Countess of Salisbury, by whom it was held until it escheated to the Crown through the execution of the Countess of Salisbury by Henry VIII. in 1541. It was granted by Queen Mary in the fifth year of her reign to Winifrid, daughter and co-heir of Henry Lord Montagu, son of the Countess of Salisbury. Winifrid married firstly Sir Thomas Hastings, and secondly Sir Thomas Barrington, of

Barrington Hall, Essex. The manor descended to Sir William Barrington, and in the Barrington family manor remained for 300 years. Ultimately the manor passed to the Simeon family by the marriage of Sir Richard Simeon, Bart. (grandfather of Sir Barrington Simeon), the heiress of Sir Fitz-William Barrington. The manor Swainston, or Calbourne, has had a very chequered career as it has been escheated to the Crown no less than times through the attainer of its various owners.

The present house, as we now see it, is a good example of Georgian work, and it is light and airy, with lofty rooms of good proportions. In the entrance hall and on the stairs are preserved the fine set of carved oak chairs which formerly stood in the old town hall of Newtown. The chairs are good examples of seventeenth-century work, possibly they may be of somewhat earlier workmanship. The chapel and old hall also merit our attention, and apparently the only remains of the earlier building which now exist. In conclusion, let me call your attention to the beauty of the situation of the house, and also remind you that our best thanks are due to Sir Barrington Simeon for granting to the members of the Hampshire Field Club permission to visit this charming place.

Mr. Dale said there had been Anglo-Saxon remains discovered in the hill close by; these were remains of a race known as the Jutes, who had a settlement in Kent. The objects discovered in the island were identical with those found in large quantities in Kent, and which were carefully preserved in the British Museum. Similar remains had been found in the Meonstoke Valley, which was also in the British Museum. Mr. Colenutt had referred to some remains that were in Newport museum; it was true they were there, but when he saw them they were a top room covered with dust. Some of these objects were peculiarly Jutish work, and when he was there in May 1906 he called attention to their value, and he hoped they would be rescued from their present position so that they might be better seen. With regard to Newtown, it was many years since the Club visited the interesting building there known as the town hall. One of the most interesting objects from that place was the mace to which Mr. Colenutt had referred, and which he was sorry they were not able to see that day; but Mr. Percy Stone's book was on the subject, and they would find a very good drawing of it there. The mace was of the fifteenth century. In Southampton they had no less than four of these early maces. They were from 18 inches to 2 feet long, and they were interesting illustrations of the evolution of the battle-mace to the modern mace. The Newtown mace was particularly interesting because of the arms at the top. When the British Archaeological Association visited the island some years ago they showed to them, and during the inspection the top fell off and it was then seen that the arms of the Commonwealth were there, having been substituted for the royal arms which were replaced at the Restoration.

Mr. Percy Stone said the ancient arms were not those of Edward IV., but of Henry VII. He suggested it would be well if these interesting island antiquities could be brought together in a museum, and perhaps some day they would find a place in the very nice museum which had now been established at Carisbrooke.

Mr. Colenutt said it would be of interest to those of a literary turn to know that a life-long intimacy existed between the late Sir John Simeon and the poet laureate, Alfred Tennyson. The cedar tree to which he had directed attention was known as Tennyson's tree, and it was said that while visiting Sir John, Tennyson wrote "The Charge of the Light Brigade." Several lines in that poem very well fitted in with the surroundings of the place. There was also a poem written there by Tennyson on the death of Sir John Simeon, which occurred in 1870. He called attention to a suite of oak carved chairs which were formerly part of the furniture of the old town hall at Newtown.

The party then visited the old hall or chapel, the portion of the original house remaining. Mr. Colenutt read a few words concerning this building, and added that Calbourne, which they were about to visit, was described in "The Silence of Dean Maitland," and that the features described in that book would be recognised. The old Newtown charters were then inspected, and Mr. Colenutt was quitting the house the Rev. G. W. Minns proposed a vote of thanks to Sir Barrington Simeon for having permitted the visit. Sir Barrington, he said, was very well known in Southampton, and the members of the club coming to that town would particularly regret that his absence that day was caused by illness, and would hope most

that in due course he would be restored to health. He also thanked Mr. Gunner for having received them, and said the charters he had brought for their inspection were extremely valuable.

Mr. Gunner, in reply, said it was a pleasure to him to meet the Club for the first time. He was a Hampshire man, and in the Isle of Wight was only what was called there an "overner." He was sure Sir Barrington Simeon extremely regretted he was not able to be present to meet them, and he should certainly write and inform him of their kind expression of thanks.

AN IRISH COMPETITION.

A SPECIAL Council meeting of the Royal Institute of the Architects of Ireland was held on Friday last to consider the conditions of competition for the proposed consumption sanatorium for the County Cork joint hospital board. Mr. C. H. Ashworth occupied the chair, and there were also present Messrs. R. C. Orpen, J. Holloway, H. Allberry, F. G. Hicks and James H. Webb, hon. sec. The hon. secretary reported that he had sent the "Conditions of Competition" as approved by the Institute to the secretary of the joint board, together with a letter pointing out that the conditions of the competition advertised by the joint board were not in accordance with the regulations therein, which fact would preclude architects of standing from competing. In reply a letter had been received from the secretary of the joint board, reiterating the main provisions of the competition, with the additional information that the work would be executed under the supervision of the joint board's engineer, and that the engineering and medical experts of the Local Government Board would be asked to act as assessors. The hon. secretary was instructed to write to the secretary of the joint board regretting that the board had not seen its way to amend the conditions, and informing him that the Council thought it its duty to point out to the members of the Institute the undesirability of entering the competition.

CAPACITIES OF CAST-IRON SECTIONAL BOILERS.*

A CASUAL reference to a boiler-maker's catalogue appears to give the necessary information as to the capacity of any boiler. But as a matter of fact this information, which possibly is accurate, is never complete. The capacity of a boiler is never constant. It is subject to variation from several causes. The quality of the fuel, the intensity of the draught, and, more important still, the duration of the test at which its capacity was estimated—all have a considerable influence on the result. For the two first causes the boiler-maker cannot, of course, be responsible. But with regard to the third, all heating engineers should, and I believe when its significance is more fully appreciated will, demand definite information. Everyone is aware that the heating power varies with the amount of air which is being supplied to the furnace. If we require a high temperature a large supply of air is necessary. The blast furnace and a smithy fire afford good examples of this, as do also the old-fashioned household bellows, which are sound in principle although they are dying out of fashion. But in all these cases the effect of forcing the air through the furnace is to consume the fuel more rapidly, and it is here that the element of time creeps in. It is absolutely useless to say what the heating power of a boiler is unless we are also told how long the charge of fuel is able to maintain the amount of radiation given, under the heading "Actual heating power," at the desired temperature.

In a power plant, where steam is being rapidly used in some mechanical operation, and where it is economical to run your boiler at a high pressure, the nature of the circumstances demands constant and watchful care; and having this constant care, it is of course possible to continually replenish the fires. But in an ordinary heating apparatus the circumstances are different. Our customers cannot and will not set aside to one of their men, unless it is an installation of considerable magnitude, the sole duty of stoking. What they require is a boiler which they can stoke over night and find still alight in the early morning. Because a boiler will maintain, say, 1,000 square feet of radiation at the desired temperature for five hours, it is not correct

to rate its actual heating power as 1,000 square feet. What we want is a boiler to run unattended for eight or ten hours; and the catalogue rating should, to my mind, be the amount of radiation it can carry that time in severe winter weather.

Let us examine this more closely. We will suppose the above boiler is installed in an apparatus where there is 800 square feet of steam radiation and 200 square feet of exposed mains. The boiler is attached to a chimney, the draught of which will burn out the fire in five hours. If at the end of that time the fuel charge is not renewed, the fire will die out and the radiators become cold. This would naturally happen during the night, and in horticultural work the results might be disastrous. We should naturally appeal to the manufacturer, and he would maintain that the boiler will heat 1,000 square feet of surface, and in the present unsatisfactory state of boiler catalogues he would be right, because the basis of his calculation is not stated. As a matter of fact, this boiler on an eight-hour basis should only be rated at 625 square feet. The reason is that a 1,000 square feet of steam radiation, at a temperature of 220 degs. Fahr. will condense 300 lbs. of steam per hour, or 1,500 lbs. in five hours. If the evaporative power of the available fuel charge is 1,500 lbs. of steam, and the boiler must run without attention for eight hours, we must divide 1,500 into eight parts, which will give 187.5 lbs. of steam per hour for eight hours, and 187.5 lbs. of steam per hour will supply only 625 square feet of radiation and no more. In the same manner the ten-hour rating would be 500 square feet. This is assuming that one square foot of radiation will condense .3 lbs. of steam per hour with steam at 2 lbs. pressure.

It may be interesting here to refer to the amount of steam which various forms of radiating surface will condense, as it gives yet another instance of the complexity of the boiler rating question.

A series of tests of a very effective type of radiator gave the following results. I was not present at these tests, but I believe the method adopted was by carefully collecting and measuring the condense over a period of one hour. The steam was at 2 lbs. pressure, and the results were as follows:—

Steam condensed in lbs. per sq. ft. per degree difference of temperature.				Heat radiated.
4-column radiator	.	.	.00166	1.60 B.T.U.
3 "	"	"	.00177	1.70 "
2 "	"	"	.00181	1.74 "
1 "	"	"	.00226	2.10 "

With a temperature difference of (220-60) 160 deg. F., and assuming the amount condensed to be constant for each degree, an assumption which is not strictly accurate, but is nevertheless near enough for practical purposes, the amounts condensed per square foot of surface per hour would be:—

Steam 160 degs. F. difference of temperature.				
4-column radiator	.	.	.26560	lbs. steam.
3 "	"	"	.28320	" "
2 "	"	"	.28960	" "
1 "	"	"	.36160	" "

These results are instructive both to boiler-makers and heating engineers. To the former it shows that even though a boiler is somewhat over-rated, it may yet be able to heat quite comfortably the stated amount of surface if it takes the form of four-column radiators, and quite fail to do so with single-column radiators; and to the heating engineer it shows that he will be able to maintain a guaranteed temperature with a smaller amount of radiating surface if he uses single-column radiators instead of four-column radiators. The explanation of this is simple. Radiation takes place always at right angles to the tangent of any point of the radiating surface. The form of the four-column radiator is such that a large amount of radiant heat must fall upon the other heated surfaces in close proximity to it; all that so falls is lost. It does not assist in warming the room. It is only that which escapes directly into the room, without encountering any intervening portion of the radiator which does. In a three-column radiator the condition is better; in a two-column radiator it is better still, and in a single-column radiator, if it is of good design, you get the best result.

What is known as the hospital radiator is even better than the ordinary single column. In this radiator the sections are rather wide apart, and this allows of a larger proportion of the heat rays passing freely away from the radiator. In addition to the radiant heat, heat is imparted to the air by contact. In this respect the boxed-in surfaces

* A paper by Mr. Kenneth Gray, read at the meeting on Tuesday of the Institution of Heating and Ventilating Engineers.

of radiators are effective, provided, of course, that there is an opening at the top of the sections to allow the heated air to pass freely away. It is rather an interesting fact that when ventilating radiators are used the result of opening the ventilators and so allowing the outside air to pass through is a rise in temperature. There is yet another factor which complicates the question, and that is height. Two low radiators, say each of ten sections, will condense more steam than one ten-section radiator of twice the height. This is because the surfaces near the upper part of all radiators are surrounded by warmed air rising from below, and so reducing the heat emission. The taller the radiators the more this fact comes into operation. The best radiating surface of all is a single horizontal pipe. Here no radiant heat is lost, all the rays passing away at right-angles to the pipe, in lines which radiate from its centre. Therefore, if the capacity of a boiler is given in the form of square feet of pipe surface, we may be sure it will be capable of heating an equal number of superficial feet in every other form of radiating surface.

It may appear that we have wandered somewhat from our subject. This, however, has been done intentionally, because, in order to clearly show what the capacity of a boiler really is, it is necessary to have a clear conception of heat emission in its relation to boiler capacity.

In testing a boiler for house heating or horticultural work, it seems to me we must consider it from three points of view, viz.:—(1) Its capacity, (2) its efficiency, (3) its working qualities.

On what does its capacity depend? It depends on the source from which the heat is derived, which is of course the fuel. This being the case, we look to the size of the fire-box, which should show the space available for the fuel, not the length \times the breadth \times the height from grate to the surface directly over the fire, but the length \times the breadth \times the height to which it is possible to charge the boiler with fuel. In the type of boiler with which we are dealing, with the feed door in the front and the grate of reasonable length, as a rule a fair estimate of the depth of fuel charge is the distance from the grate to the centre of the feed door, so that strictly speaking the dimensions of the fuel space (or fire-box) are the length by the breadth by the height from grate line to middle of feed door, the space above this being essentially the combustion chamber.

In some boilers where the feed door is near the top of the front section, you cannot of course fill to the middle of the door. A little practice and careful consideration will enable you to form a fairly accurate opinion.

Having determined the amount of fuel that our boiler will hold, we must remember that the total heat of this charge is not available. A certain portion of it must still be unconsumed when the time comes for replenishing the fires, and this will vary from 15 to 20 per cent., the former being approximately the amount where coke is being used, and the latter when coal. Having made this deduction we know exactly how many pounds of fuel we have to consume during the test. We have already considered the time for which it is necessary for this fuel charge to last and decided it should be 8 to 10 hours. In basing our calculation we will use the former. As the heat loss from a building is calculated on an hourly basis, we must get our fuel down to an hourly basis and therefore divide the number of pounds by eight. For example, we will assume a boiler which will hold 300 lbs. of coke; 85 per cent. of this amount is 255 lbs., which divided by eight gives practically 32 lbs., which is the amount available per hour.

Now that we have arrived at the number of pounds of fuel per hour, we must assume a certain calorific value per pound. Time does not permit of our considering the relative values of the different classes of fuel, and therefore in dealing with this subject we will assume a fair average to be 12,000 B.T.U.'s per pound.

We now come to the efficiency of a boiler, and the next question is to determine the proportion of these heat units that will be utilised. From numerous tests of these boilers, it has been found that it is possible to obtain an efficiency of 70 to 75 per cent.; in other words, that 8,400 to 9,000 B.T.U.'s are available per pound of fuel, of which the calorific value is 12,000 B.T.U.'s per pound. Knowing that the conditions under which boilers operate in general use are not so favourable as in a test, it would seem that 8,000 B.T.U.'s per pound would be a fair estimate for calculation. But here a great deal depends upon the design of the boiler, and our estimate is based on the assumption that the heating surface of all boilers is equally efficient. Due consideration, however, must be given to the fact that the

surface in the fire-box and the combustion-chamber is of much greater value than the more remote surfaces in the flues, and therefore it is incumbent on heating engineers to make a study of the relative efficiency of heating surface in different positions. My own experience has been that a boiler with a large amount of direct heating surface and a reasonable amount of flue surface in general gives the best result, because it can be made to respond readily in case of a cold spell, and will give a good result when connected to an indifferent draught, such as is so often the case in horticultural work, and can also be kept in check with a sliding damper in the chimney, should the draught be excessive.

Having found that the available amount of heat per pound of fuel when burned in a well-designed boiler is 8,000 B.T.U.'s in the case assumed above, where 32 lbs. of coke is consumed per hour, we have $32 \times 8,000 = 256,000$ B.T.U.'s available per hour.

The above information may seem at first glance a rather long and complex calculation, but it can be condensed for practical purposes into a very simple form, which can be noted in a pocket book and readily applied for both water and steam boilers:—

	Water. Degs. F.	Steam. Degs. F.
Mean temperature of water and steam (2 lbs. pressure) in radiators	150	220
Temperature of air in rooms	60	60
Difference of temperature of air and heating fluid	90	160
B.T.U.'s emitted per square foot per hour per degree of temperature (radiation coefficient)	1.6 B.T.U.	1.6 B.T.U.
Total radiation per square foot of surface	144 B.T.U.	256 B.T.U.

NOTE.—Measure fire-box (not including combustion chamber) to find amount of fuel, deducting 15 per cent. for coke and 20 per cent. for coal.

If 1 lb. of fuel is burnt in eight hours the available B.T.U.'s per hour will be $\frac{8000}{8} = 1000$.

" 1 lb. of fuel will supply $\frac{1000}{144} =$ say 7 s. ft. water radiation for 8 hours.

Also " " $\frac{1000}{256} =$ say 4 s. ft. steam radiation for 8 hours.

In the example we previously mentioned, when we found the available fuel capacity of a boiler was 255 lbs., the number of square feet of radiation it will carry is:—

Lbs. Coke.	Square Feet.
$255 \times 7 =$	1,785 square feet water radiation.
$255 \times 4 =$	1,020 square feet steam radiation.

I hope I have succeeded in clearly distinguishing between the capacity and efficiency of a boiler. To put this more concisely I will say the capacity of a boiler is the number of square feet of radiating surface it will supply (for eight hours) with one charge of fuel. The efficiency being the number of B.T.U.'s per pound of fuel burnt it utilises for heating purposes. A boiler with a high heating capacity may yet have a low efficiency. The difficulty in designing a boiler lies in combining a high capacity with a high efficiency, and I can assure you it requires great skill and care and patient trial before this can be accomplished.

The third important feature that must be closely investigated is what I have called the "working qualities."

First of all there must be, in a water boiler, a rapid circulation of the water. This can only be secured by having small waterways so arranged that there is no possibility of the divided streams of water meeting each other. All should converge through channels with easy bends towards the flow tappings. The more rapid the circulation the greater the heat transmission from the fire to the fluid, just in the same way that the heat emission from indirect radiation increases with the velocity of the air passing over it. I have a record of experiments on this subject which shows a heat emission of 3.42 B.T.U.'s per square foot with the air velocity at 3 feet per second, increasing to 4.94 B.T.U.'s at 6 feet per second, 6.93 at 12 feet per second to 9.79 at 24 feet per second. This fact alone will show how greatly the efficiency depends on the design.

The same rule applies in a less degree to steam boilers. They must also maintain a steady water line for all pressures

they are likely to be worked at. This means, of course, that no priming must take place. To secure this the flow tappings must be of such a size to keep down the velocity of steam passing from the boiler. If this is too great it will carry small particles of water with it. In both steam and water boilers it is essential that all surfaces are accessible for cleaning. The furnace doors must fit tight and, with the clinker doors, should be ample for their purpose. The draught doors and regulating damper should be so designed that the amount of air passing through the fire can be accurately controlled. These are the chief features, and a heating engineer who has the interest of his customers at heart, will inquire closely into them before selecting a boiler.

In conclusion I will refer shortly to chimneys, which in this country are often so unsatisfactory. On the Continent architects are more closely acquainted with the technical part of their work than is sometimes the case here, and accordingly they provide in a new building a chimney of suitable size and construction to insure a good draught in the boiler. I may say here a good draught should give you a temperature of about 1,200 deg. F. in the combustion chamber, and with this temperature a well-designed boiler will give from 300 to 500 deg. in the stack. Every chimney should be fitted with a sliding damper, to cut down the draught if necessary to the right amount. When once its correct position has been ascertained, it should not be moved again, all regulation being done by the dampers on the boiler. For this purpose it is most advantageous to have an automatic draught regulator, which will maintain an even temperature in the boiler, prolonging its life and incidentally saving fuel, for the efficiency of a boiler varies with the draught. The chimneys should be as straight as possible, a round section giving a better result than a square one. It should not be contracted in sectional area at any point. This often happens where the pot is fixed. Where the iron flue enters the chimney it should not be allowed to project beyond the thickness of the brickwork. Soot doors in chimneys should fit closely. The top should be carried up to a level which assures it will not be affected with down-draught. All these points are important to the heating engineer, because they are often held responsible for the unsatisfactory working of an apparatus which is entirely due to a faulty chimney. At the same time it is clearly the duty of an engineer to find out what kind of chimney is available for his apparatus, because it should guide him in selecting a suitable boiler. When he is in doubt about the efficiency of the draught he should select a boiler with a large direct heating surface and very little flue travel, for although a fair proportion of flue surface is useful when the draught is good, it is worse than useless when the draught is sluggish.

Let me add in conclusion that we shall, I believe, be taking a step in the right direction, and I trust you will agree with me in this, when we unite in calling upon all boiler-makers to furnish us with a clear and definite statement of what the boilers are really able to do.

TOWN PLANNING.

THE annual conference of the Incorporated Association of Municipal and County Engineers was held last week in Liverpool.

Mr. John A. Brodie, city engineer, delivered the presidential address. His subject was the laying-out of towns and the improvement of roads. Liverpool being a great commercial depôt needed particularly easy and wide and direct roads of communication in and out of the city. The general policy of the small local authorities on the borders of large towns had been to construct narrow roads sufficient merely for local traffic and quite unsatisfactory as outlets for a great centre. In Liverpool alone no less than 1,250,000% had been expended in the last ten years in widening main thoroughfares to meet the traffic needs. The policy of the Liverpool Corporation had been to secure a minimum width of 60 feet for all main lines of communication, and much had been done in advance of building by arrangements with the landowners. Public authorities should have larger powers in connection with the laying-out of all main thoroughfares, and he commended the methods in operation in Germany, the United States and Canada. It would no doubt be difficult to obtain powers in England equal to the German powers, but it was to be hoped that some of the larger municipalities in this country would make a bold attempt to obtain control of the laying-out of building areas, as there could be no doubt that such powers should be in the hands of the authorities

as would enable all building areas to be so laid out as to provide necessary roads and means of communication of ample width; and also to provide ample spaces for playgrounds and sites for public buildings, whilst the land was still undeveloped and was therefore obtainable at a cheap rate. Greater powers were necessary also in connection with the laying-out of those small and irregular areas commonly to be found under separate ownerships in the neighbourhood of towns in this country. At the present time local authorities had very little control over the laying-out of streets in such areas except by arrangement with the landowner, and cases often arose in which the landowner could comply with the by-laws and yet set the authority at defiance. Some method was required by which the authority should have the power to disapprove of such plans, and to prevent under a penalty the construction of streets otherwise than in accordance with such conditions as they might approve in the matter of direction, width and levels of roads. In cases of small and irregular areas, failing agreement between the respective owners as to the adjustment of boundaries, powers might well be given to the local authority to adjust boundaries, of course after hearing evidence on behalf of the parties interested.

Mr. E. G. Mawbey, of Leicester, said no useful purpose would be served by abusing motorists, who were entitled to gratitude for bearing the expense of developing a new industry. It was their business to make roads in such a way as to provide for the future development of the motor industry. He moved:—"That the Council be empowered to prepare and present to the Local Government Board a memorial in favour of a Bill being introduced to Parliament to enable local authorities to regulate and control the planning of main thoroughfares and building areas, and to prescribe the number of houses to be erected on an acre of ground, and also giving power to local authorities to acquire land for open spaces, and to facilitate the improvement and development of their respective building areas."

Mr. E. R. Pickmere (town clerk of Liverpool) said they must not ask for too much or they would stand the risk of having their Bill thrown out. The most they could expect was that a local authority should have power to say how wide their streets and roads should be, what materials they should consist of, and decide in what direction they should run on the various estates. As to the number of houses to the area, it had been thought that the desired object might be obtained by requiring that a certain number of houses should be specified, or by stringent by-laws as to air spaces.

Mr. T. L. Dodds (mayor of Birkenhead) said that local authorities did not possess sufficient power in regard to the planning of their own towns. He had studied especially four German municipalities, and he had been impressed by the much larger powers possessed in Germany than were held by the public bodies of this country. The German authorities had absolute freedom to take land and make an equitable arrangement with the owners, and he had been informed that no difficulties at any time had ever arisen in regard to the enlargement and improvement of main thoroughfares. That was a condition of things which ought to exist in England. He was of opinion that there should be immediate legislation for acquiring the control of outlying districts which were likely to be brought within the areas of borough boundaries, while there was a pressing need for greater powers for the supervision of buildings and for the widening of back streets and passages.

SOCIETY OF ENGINEERS.

A VISIT was made by the members of the Society of Engineers on Wednesday, June 19, to the new reservoirs of the Metropolitan Water Board in course of construction at Honor Oak and of which the following is a description:—

These reservoirs will contain nearly sixty million gallons of water, and will probably be the largest covered reservoirs in the world. They are being constructed near Homestall Road, Honor Oak, Camberwell. The construction generally is of brickwork and concrete, with division walls, separating the reservoir into four divisions. The longitudinal centre wall runs approximately north and south, so for the purpose of reference the reservoirs will be known as the north-east, north-west, south-east and south-west.

The outside walls of those portions of the south-east and south-west reservoirs which are below or level with the natural ground represent in plan a series of flat arches so

as to resist earth pressure. The north-east and north-west reservoirs have concrete retaining walls, faced with brickwork. The centre dividing walls are also arched in plan, and are practically double walls filled in between with concrete, the thickness varying from 6 feet in the centre of each bay to 10 feet at each buttress.

Around all the outer walls and the division walls buttresses in brickwork project into the reservoirs. These buttresses are carried up solid to the drums on the roof covering, and in themselves form substantial counterforts to the walls. The floor of the reservoir is of concrete, and its surface will be formed with curved inverts groined so as to form bases from which the brick piers carrying the roof will rise. This inverted floor will be finished with $\frac{3}{4}$ inch of cement rendering to a smooth polished face with a drain down the middle of the invert, draining all the water into the collecting channel.

From each base a brick pier is built, which is continued up 14 feet, where jack arches are turned, connecting each pier north and south. From the top of the wall thus formed the drums of covering arches spring. The drums form a series of tunnels running north and south. The haunches of the arches are filled with concrete, on the top of which clay puddle will be placed, followed with earth and, finally, soil. A drain with open joints is laid on the surface of the puddle for the purpose of draining the top of the reservoir. A puddle wall 3 feet in thickness extends all round the outer walls, and is keyed into the clay, thus making the work watertight.

At the centre of the four reservoirs where the division walls intersect will be the central well, from which the charging and emptying will be directed. All the opening valves—42 inches, 36 inches and 30 inches—will be arranged round the well and worked by means of headstocks from a gallery running round the well. By means of special connections, it will be possible to work each or every reservoir at the same time without interfering with the others. Above the central valve well will be a valve house, in which the electrical recording indicators will be arranged. When the works are completed, the tops of the reservoirs and the slopes will be soiled and sown with grass seeds.

The bricks used in the construction of the reservoirs have all been manufactured by the Southwark and Vauxhall Water Company, and later by the Metropolitan Water Board, from the excavation. Not only has the material been utilised in the making of the bricks, but the ground has been excavated on the site of the reservoir, thus reducing the quantity of earth to be handled by the contractor. It will be seen that the works involve the use of a large amount of concrete, in the production of which four of Taylor's one-yard concrete mixers are engaged. In these mixers each charge of material is measured and mixed separately, and each of the machines employed will mix 24 cubic yards of concrete per hour.

The whole of the works were designed by Mr. J. W. Restler, M.Inst.C.E., and are being carried out under his direction and supervision by J. Moran & Son, Ltd., as contractors. The estimated cost of the works, including pipes and valves, but exclusive of land, is approximately 170,000l.

Rebuilding Hexham Church.

SIR,—I note your paragraph in last issue, and write to say that there never was an *abbey* at Hexham. The church in question was the *priory* church.—Yours faithfully,

JOHN A. RANDOLPH.

GENERAL.

Sir Benjamin Baker, K.C.B., K.C.M.G., F.R.S., civil engineer, of 2 Queen Square Place, Westminster, and Bowden Green, Pangbourne, whose death took place on May 19, left a fortune of 170,513l. By a will of October 1902 he gave 2,000l. to the Institute of Civil Engineers, and his share of the goodwill of his businesses, with the furniture, books, &c., to Arthur Cameron Hurtzig and Frederic Shelford.

The Foundation-stone of the new wing of the British Museum, designed by Mr. J. J. Burnet, was laid by the King yesterday.

Mr. Walter Crane, as president of the Arts and Crafts Exhibition Society, writes contradicting an unfounded report that the Society has been disbanded. So far from that being the case, he says:—"We are a stronger band than before, having elected many new members since our last exhibition in 1906, and we are now, according to triennial custom, contemplating our next show, which we hope to open in the autumn of 1908."

A New Statute will be proposed to Congregation next term establishing a Professorship of Engineering Science at Oxford, with a stipend of 800l. per annum. The professor will give laboratory—but not workshop—instruction.

At the Last Edinburgh University Court a copy of declaration of trust by Sir John Jackson, civil engineer, London, was submitted providing an endowment yielding about 200l. per annum, which he desired to be designated a Professor Tait's Memorial Fund for the purpose of encouragement of physical research in the University of Edinburgh.

The Executive of the Scottish National Exhibition are not confining themselves strictly to the plans recently accepted, and the views of the executive and the manager are being met by modification or alteration. It will be the end of July or beginning of August ere an actual start is made with the buildings.

A Special Committee of the Gresham Committee, which has the control of the Royal Exchange, has been making investigations into the sanitary condition of that building, and, after hearing expert evidence, has decided that the premises are in urgent need of redrainage. It is estimated that the cost of this work will be about 4,000l.

Sir Horatio Davies, who recently sold the site on which Crosby Hall stands to the Chartered Bank of India, Australia and China, will offer, in the event of the bank authorities deciding to adopt no steps to preserve the antiquarian parts of the hall, to give the building to the Corporation, who would be able to take away any article of historic interest and place it in the Guildhall Museum; or, if they so liked, could remove the whole building and reconstruct it elsewhere. Crosby Hall is to be closed in July.

Mr. W. T. Dannat, the American painter, has received the distinction of Grand Officer of the Order of the Crown of Italy. He is also Commander of the Legion of Honour.

Mr. W. H. Goodyear, of the Brooklyn Museum, has been elected honorary Academician of the Royal Academy of Fine Arts, Venice, in recognition of his services in investigating the construction of St. Mark's.

The Special General Meeting of the R.I.B.A. summoned by the Council to receive the recommendations of the Council for the revision of the charter and by-laws will be held on Tuesday, July 2, at eight o'clock.

Mr. Wm. Woodward, F.R.I.B.A., F.S.I., of 13 Southampton Street, Strand, W.C., has taken into partnership his two sons, Charles and Frank.

At the Annual Meeting of R. Waygood & Co., Ltd., it was stated by Mr. H. C. Walker, the managing director, that on the asset side of the balance-sheet, goodwill and patents were represented by 67,576l., and freehold and leasehold property by 71,233l. The increase in the last item was accounted for by the purchase of property at Coventry, in view of the fact that at some time the company might be driven out of London, partly on account of the rates in the Metropolitan being so heavy.

The House of Lords, consisting of the Lord Chancellor, Lord Robertson, Lord Atkinson and Lord Collins, were occupied on Monday in commencing the consideration of an appeal by the Corporation of Dudley against the Dudley, Stourbridge and District Electric Traction Company. The question raised was whether a light railway which was being purchased by the Corporation from the company was to be valued upon the basis of a structural valuation regarded as a railway fixed in position, capable of earning a profit, or upon the basis of the value of the railway to the company as an income-earning concern, that is, upon the capitalised value of the net profits which have been earned by the railway.

The Chairman of the Belfast Harbour Commissioners has announced to the Trust that Messrs. Harland & Wolff had lodged with the Board plans for an extension of their shipbuilding plant, the carrying out of which will involve the outlay of 50,000l. There is reason to believe that this outlay was but an instalment of much larger sums which might be expended in the near future.

THE
Architect and Contract Reporter.

FRIDAY, JANUARY 4, 1907.

Published weekly, subscription 19s. per annum for Great Britain, and for Colonial and Foreign subscriptions £1 6s. 6d. All business communications to the Managing Director,

P. A. GILBERT WOOD,

Publishing Offices, 6-11 Imperial Buildings, Ludgate Circus London, England.

** Entered in the United States of America as second-class matter. Agents for America, The International News Co., 5 Bream's Buildings, Chancery Lane, London, England, and New York.

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Ltd., to establish Branch Offices in that district at 43 OLD QUEEN STREET, S.W., Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

The Birmingham Offices are at 102 COLMORE ROW.
E. D. AINSWORTH, Manager.

AGENTS FOR THE COLONIES.

MESSRS. GORDON & GOTCH,

Melbourne, Sydney, Brisbane, and Perth, Australia; Wellington, Christchurch, and Auckland, New Zealand; Launceston and Hobart, Tasmania.

SOUTH AFRICA—Central News Agency, Ltd.

Telephone No. 4725 Holborn.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tender and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRELAND.—Feb. 6.—The Galway Board of Guardians invite plans and estimates of a proposed fever hospital. The premium of 25l. will be merged in the architect's fees if the winner carries out the work. Particulars from Mr. R. F. Mullery, clerk to the Union, Galway.

TRADE NOTES.

MESSRS. JONES & LEACH, of Newtown, North Wales, have opened London offices and show-rooms at 20 Victoria Street, S.W.

THE Hunslet Engine Company, Ltd., of Leeds, have appointed Messrs. J. E. Lawler & Muirhead, of 39 Lime Street, as their London agents.

WE understand that the contract for the fireproof floors, &c., for the new Manchester Infirmary has been entrusted to the National Fireproof Company, and that they are carrying out the work.

At the new Tollard Royal Hotel, Kingsway, W.C., "The Only" closet was fitted throughout and supplied by the Sanitary Appliances Syndicate, Ltd., of 68 Victoria Street, S.W. This firm has recently fitted a range of five, with 3 feet head of water, at the Princeton Street infants' schools, Bedford Row, W.C.

MESSRS. J. B. JOYCE & Co., Whitchurch, Salop, have just erected a large Cambridge quarter-clock at Allendale Church, Northumberland. It shows time upon three dials and contains all the best improvements. The same firm are fixing a clock for Sir Spencer Wilson, Bart., Fitzjohns, Rugby, and are sending one to New York in the course of a week or so.

THE old-established firm of Parnall & Sons, Ltd., of Bristol, have lately made considerable extensions to their works, whereby the floor-space for the wood-working department has been greatly increased, the foundry accommodation has been doubled, and the whole works have been remodelled and arranged to be driven throughout by electric motors. The firm's productions consist of shop fronts and interior fittings for all trades, weighing machines from a jeweller's balance to the heaviest weighbridge, coffee mills, fruit cleaners and, in fact, every requisite required by that great and ever-growing community known as shopkeepers. The works are situated in Narrow Wine Street, Fairfax Street, Rosemary Street, and Fishponds, Bristol, with show-rooms in Narrow Wine Street, Bristol, 10 Rood Lane, London, and Alexandra Road, Swansea.

TENDERS FOR THE YEAR 1906.

THE following are a few of the more important works that were estimated for during 1906, the tenders for which appeared in our columns in the course of the year :—

CARDIFF.

For the erection of the first portion of the University College buildings in Cathays Park.

A COMMISSION was some time ago appointed by the
Bishop of Gloucester to inquire into the question of church
accommodation in the city and the rearrangement of parishes.
Their report recommends the reconstruction of the parish
of St. Catherine and the erection of a new church at Wotton,
on the north side of the city; the creation of a new parish
on the south side connected with St. Luke's parish, the re-
arrangement of the boundaries of other parishes and the
erection of two new mission churches.

MANCHESTER ROYAL INFIRMARY.

BUILDING AND BUILDERS.

MESSRS. SPALDING & SPALDING have removed to new offices at 36 and 37 Cheapside, London, E.C.

THE contract for the nave of Hexham Abbey has been secured by Messrs. Holloway Bros., of London.

It is proposed to build a new isolation hospital for the Woodford (Essex) Urban District Council.

MESSRS. ISAAC JENKINS & JOHN JONES, builders and contractors, of Johnstown, near Ruabon, have dissolved partnership.

MESSRS. GEORGE EDWARD BOLSHAW & HENRY JOHN STEVENS, architects and surveyors, of Princes Street, Harrogate, have dissolved partnership.

FOR the new fish market at Lerwick, N.B., which is being erected at a cost of 3,104*l.*, Mr. George Lyall, jun., builder, of Aberdeen, has secured the contract.

SEVERAL thousands of pounds damage was done by an outbreak of fire on Wednesday at the residence of Colonel Ricardo, at Maidenhead.

As we go to press a very serious outbreak of fire is reported at Portsmouth Dockyard. The damage up to the present is very severe, and amounts to many thousands of pounds.

MR. G. WRIGHT, of Southend-on-Sea, has been appointed to take out the quantities for the extensions at the workhouse, for the Rochford Guardians.

VARIETIES.

A new theatre of varieties is about to be erected at Barking, Essex.

THE Haslingden Board of Guardians are considering a scheme for building a new infirmary at the workhouse at an estimated cost of 27,415*l.*

THE London County Council have ordered that their new cottages at Norbury are not to be photographed without the Council's sanction. The cottages consist of four rooms each, and are constructed with bricks made in the Council's brickfields in the vicinity.

THE general purposes committee of the Dudley Town Council recommend that an assistant be engaged by the sanitary and water-supply committee for the borough surveyor's department, to undertake the duties of drainage and building inspector, and that the general purposes committee pay one-third of his salary.

THE select committee of the House of Lords appointed to inquire and report in respect to the unfinished condition of the rooms in the Palace of Westminster appropriated to the service of the House and their approaches have been unable, owing to the short time at their disposal, to bring their inquiry to a conclusion during the past session. They therefore recommend that they should be reappointed next session.

A BLOCK of offices seven storeys high is to be erected on the site of Nos. 252, 254 and 256 Vauxhall Bridge Road—Victoria Street end—for the Central London Estates, Ltd. The contract has been signed with Mr. Charles Gray, of Shepherd's Bush, and the work is to be pushed forward with all speed. The elevation will be carried out in red bricks with grey terra-cotta dressings. An electric lift will give access to the various floors. The architects are Messrs. Palgrave & Co.

THE American Consul at Kehl, in a report to the Washington Bureau of Manufactures, says that the long-talked-of regulation of the river Rhine between Mannheim and Strasburg will soon be an accomplished fact, as the three Governments, namely, Alsace-Lorraine, Baden and Bavaria, have come to an understanding, and voted the money necessary for deepening the channel sufficiently to

enable boats to reach Strasburg during all seasons. Some years ago extensive stone docks were built at Kehl and Strasburg for the accommodation of vessels coming up the Rhine, but these docks are practically useless during the stage of low water, which usually exists for a period of from 100 to 200 days each year.

REPRESENTATIVES of the ironmongery and allied trades of Glasgow met in the Building Trades Exchange last week to protest against the gas department of the Glasgow Corporation trading with public bodies, private firms and householders in competition with the trade. After a discussion the following resolution was unanimously passed:—"That this meeting of representatives of the ironmongery and allied trades protests against the action of the gas department of the Corporation of Glasgow in trading with public bodies and private firms and householders, and supplying to them lamps, stoves, fires and other gas supplies in competition with the trade." A committee was appointed to conserve the interests of the ironmongers.

THE members of Epsom parish church have adopted the following resolution with regard to the erection of a new church on a system of enlargement of the present structure:—"That the chancel and two bays be built now and an additional third bay be proceeded with if the building and finance committees, after considering tenders and cost, decide that the funds then promised or received justify its being taken in hand. To this end it is proposed that tenders be invited for the building of the chancel and two eastern bays of the new church, and further tenders for an additional third bay; also an estimate for necessary temporary work if the third bay was postponed, the remaining portion of the present church to form a temporary west end." The plans have been prepared by Sir Charles Nicholson.

In a recent report issued by the United States Department of Commerce and Labour it is stated that a bulletin of the Geographical Survey calls attention to the fact that there is a noticeable concentration of interests in the cement industry, and that this will probably become more accentuated year by year. The eighty-eight plants in existence in 1905 were owned by seventy-eight companies, and several of these nominally independent companies are

closely connected by ownership. It is stated, however, that good raw materials are so widely distributed in the United States that there is hardly a county which could not produce Portland cement if prices were forced high enough. The only limitation now on the erection of cement plants is in the fact that the great cost makes the venture prohibitive for the individual or the small firm. The cement industry is at present in a more concentrated condition than was the iron and steel industry at the date of the formation of the United States Steel Corporation. The total authorised capital of all the American Portland cement companies now in operation will fall between the limits of 22,000,000*l.* and 25,000,000*l.* The bulletin states that this capitalisation cannot be considered excessive in view of the fact that it would cost probably from 15,000,000*l.* to 17,000,000*l.* to replace the plants now in existence.

THE present demand for materials employed in engineering work is so exceptional for this season of the year, says the New York *Engineering Record*, that it deserves special mention. It is customary in the cement industry, for example, to find a reduction in the manufacturing rate by the first of November, for from this time until spring the demand for cement ordinarily shows a marked falling off, and few mills have sufficient stockhouse capacity to enable them to accumulate and carry large quantities of finished cement, while only a very few make any attempt at all to keep on hand a large amount of clinker, which is more easily stored. To-day such additional storage would be of little value, for, contrary to all precedent, the mills are still running about as many kilns as in July without being able to accumulate any stocks, so great is the present demand. In the iron and steel industry the situation is the same. The demand for pig-iron, particularly foundry iron, is so large that a considerable increase in importations seems likely. The blast-furnace record of the Steel Corporation was broken last month and its steel plants also broke the record. Steel castings cannot be procured under a month, unless they are small and are furnished more promptly as a favour to some particular purchaser. The cast-iron pipe foundries are in an unusually busy condition, and it seems hardly necessary to say that structural steel is very hard to get with anything approaching promptness.

"KORKSTEIN."

KORKSTEIN, or corkstone, is not known to geologists, for it is the appropriate appellation adopted for a material which has been found peculiarly suited for insulating freezing chambers, refrigerating plant, boilers, steam-pipes, &c. It is equally adapted for the insulation of walls, floors, ceilings, &c. Korkstein has been introduced in this country by Messrs. Chittenden & Co. There are two varieties, viz. "Reform" and "Emulgit." The former serves when the temperature of the object to be insulated lies between zero and 20 degrees below zero (centigrade), while emulgit serves for temperatures between zero and plus 150 degrees. At the present season emulgit would save annoyance in many houses in protecting pipes from freezing. It is characteristic of the manufacturers' system of avoiding all exaggeration in describing their product when we find them saying that there is a limit to what emulgit can do in that way. Reform corkstone slabs can be employed as an interior or exterior lining for walls. It is manufactured in Austria, and has been largely used throughout Eastern Europe. The material was subjected to severe tests in the Royal Technological Museum of Vienna, to define its strength, conductivity and fireproof qualities. The results were most satisfactory. There is a wide field for corkstone in this country.

ALMANACS FOR 1907.

WE have received a calendar issued by Messrs. Diespeker & Co., Ltd., of Holborn Viaduct. It is very tastefully produced; the figure is excellent, but the subject is somewhat cool for the weather we have lately had. The Sun Fire Company, with its blazing sun, is warm and comfortable after a view of Messrs. Diespeker's cool and artistic production. Messrs. G. M. Hare & Co. are sending out a peacock with a yellow moon. Mr. Harris, of the Chemical Cleaning and Dyeing Company, has adopted a theatre curtain for his calendar. The effect is given of the curtain being down with an advertisement of the Cleaning Company appearing on it. Messrs. Ashwell & Nesbit, Ltd., have an

illustration on their calendar of the Belfast City Hall. The figures on the calendar are very bold, and contain at foot Shakespearean quotations. The Edinburgh Life Assurance Company are issuing a calendar with a portrait of Sir Walter Scott, the founder of that office. With numerous others we have calendars from Messrs. Watts, Finch & Co., galvanisers and constructional engineers, of Billiter Buildings, London, E.C., and a no doubt useful, but far from ornamental, calendar from Messrs. W. T. Glover & Co., of Trafford Park, Manchester.

MANUFACTURE OF PAINTS AND COLOURS.

THE Home Secretary has issued amended regulations under section 79 of the Factory and Workshop Act, 1901, for the manufacture of paints and colours. The regulations will apply to all factories and workshops in which dry carbonate of lead or red lead is used in the manufacture of paints and colours or chromate of lead is produced by boiling, but they are not to apply to factories and workshops in which paints and colours are manufactured not for sale but solely for use in the business of the occupier, or to factories or workshops in which only the manufacture of artists' colours is carried on, or to the manufacture of varnish paints. Regulation 2 and so much of Regulation 3 as prevents the employment of a woman in manufacturing lead colour are not to apply to the packing in parcels or kegs not exceeding 14 lbs. in weight, unless and until so required by notice in writing from the Chief Inspector of Factories. It is provided in the regulations, among other things, that no lead colour shall be placed in any hopper or shoot without an efficient exhaust draught and air guide so arranged as to draw the dust away from the worker as near as possible to the point of origin; that no lead process shall be carried on save either—(a) with an efficient exhaust draught and air guide so arranged as to carry away the dust or steam as near as possible to the point of origin; or (b) in the case of processes giving rise to dust, in an apparatus so closed as to prevent the escape of dust (provided that this regulation shall not apply to the immersion and manipulation of lead colour in water); and that no woman, young person or child shall be employed in manipulating lead colour.

TO CHECK PICKETING AND INTIMIDATION.

The Labour Protection Association, 25 Victoria Street, London, S.W., whose object is to watch all trade disputes and defend the interests and rights of masters and free workmen during strikes, has issued the following circular to its members and to employers' associations throughout the country:—

The Trades Disputes Act and the Protection of Free Labour against Picketing and Intimidation.

Parliament having relieved labour unions of all responsibility for the acts of their agents during trade disputes and strikes, and conferred upon these organisations the right to picket in unlimited numbers (for the purpose of "persuading" a person to do that which he is unwilling to do) any place where such person (workman or master) may work, reside, or happen to be, the necessity has arisen for such steps to be taken as will protect free workmen and their masters against intimidation, molestation, annoyance, or the other evil features of labour-union warfare. The Labour Protection Association is prepared, at short notice, to provide its members with an adequate number of experienced men, who have served in the military, naval, or police forces, to undertake the watching and counter-picketing of factories, workshops, mines, railways, and of all places where work or business is carried on which may be picketed by the agents and emissaries of the labour unions. The Association would thus safeguard the property and person of all who may be in fear of the ruffianism, brutality and terrorism (humorously and now by statute called "peaceful persuasion") which so often characterise the methods of labour unionism in enforcing its demands and furthering its ends.

PADDINGTON Borough Council has instructed its representative at the Metropolitan Water Board to request the Board to discontinue the practice of cutting off the water-supply from premises in respect of which the water-rate has not been paid, and to substitute legal proceedings for the recovery of such rate where necessary.

LIGHTNING CONDUCTORS.

A LECTURE was delivered by Mr. Alfred Hands before the Royal Engineers at Chatham on "The Protection of Buildings from Lightning." He showed the extent of damage done by lightning by means of a chart of England and Wales on which the positions and nature of objects damaged during a period of about nine years were indicated by coloured spots. This included 2,485 buildings, of which 148 were churches. He criticised the report of the lightning research committee, which, he said, by its contradictory recommendations and incorrect statistics, had caused a great deal of scepticism as to the utility of lightning conductors. He explained, by diagrams and reproductions on models of buildings of cases that had occurred, some of the more complex lightning effects that had to be guarded against and the methods of protection that had to be employed. These included fires caused by the surging effect of a discharge, and cases in which damage is caused to a building by lightning striking an object half a mile away.

The lecturer showed the impossibility of protecting buildings efficiently by means of set rules; each case had to be studied separately, and the system of protection applied which the complications of metal in and about the structure showed to be necessary. Hitherto too much importance had been attached to the form and composition of the conductor, and too little to the fact that its efficiency depended almost entirely on the way in which it was applied and very little on what it was. He regarded the subject as somewhat analogous to the work of a medical practitioner. The conductors in the hands of an expert were comparable to the drugs a physician might find it necessary to prescribe according to his diagnosis of the case. No one could claim infallibility, and anyone might overlook some factor that might have an important bearing on the case; but the fact remained that the possession of knowledge, experience, and an ability to discriminate as to the importance of details should enable a man to protect a building effectively, while absence of these would very probably result in failure. At all events, it was in this direction he thought we should strive to improve our methods, and not in trying to devise

theoretically perfect, but practically impossible, mechanical ones.

As regards the relative value of iron and copper for conductors, Mr. Hands considered the matter, so far as concerned conductivity and the dissipation of energy, to be of such trifling importance that it sank into insignificance in comparison with considerations of durability. A lightning conductor was expected to last for a long time, and iron was unfortunately too perishable for the purpose. As regards cost, an iron system, if of sufficient size to be fairly lasting, would be more costly than an ordinary copper tape one.

Mr. Hands said that vagaries or freaks of lightning were an impossibility, and the belief in such was due only to the cases being wrongly reported. There were laws governing all natural phenomena, and lightning, like every other force in nature, must be amenable to law. Where they appeared at first sight inexplicable, we should try to clear up the mystery and not dismiss the matter by saying that in one respect nature was erratic.

BUILDING TRADE IN GLASGOW.

REPORTS regarding the building trades of the city at the close of 1905, says the *Glasgow Daily Herald*, gave little hope of much improvement during the year just closing, but notwithstanding that the outlook then was anything but cheerful, the actual money value of the work done is more than might have been expected. This has been due principally to certain improvements in the western and southern districts of the city. At York Hill several new streets have been formed, and twenty-six tenements are in course of erection there. The new Mitchell Library in North Street is also being erected, and among other important work of which notice must be taken is that in Hope Street and the block of buildings on the north side of Sauchiehall Street. The linings passed by the Dean of Guild Court represented a total value of 1,188,488*l.* in comparison with 1,439,434*l.* in 1905. This is the lowest amount recorded within the past fifteen years. The extensions of the Corporation Tramways have to a large extent

caused speculative builders to direct their attention to suburban districts, and considerable activity has been in evidence in Newlands, Giffnock, Craigton and Scotstoun, both in the matter of tenement and villa building. The number of houses included in the linings passed by the Court is similar to that of last year, though the linings granted were twelve fewer. The value of the tenements was 567,580*l.*, representing eighty linings and 2,389 apartments; in 1905 the value of the 2,350 apartments for which ninety-two linings were passed amounted to 582,853*l.* This shows that the houses erected during the past year are of a better class than those built in 1905. In the western district two linings were granted for 201 houses of two apartments and fifty-five houses of three apartments, the valuation being 4,955*l.*, whereas in 1905 one lining was granted for twenty-six houses of four apartments with a valuation of 8,500*l.* A distinct decrease is shown in the eastern district, for in 1906 sixteen linings were granted for tenements of one apartment and upwards—in all 510 apartments—with a valuation of 79,120*l.*; whereas in the preceding year the linings numbered thirty for 290 houses of one apartment, 1,035 houses of two apartments, and seventy-nine houses of three apartments—altogether 1,404 apartments—with a valuation of 235,028*l.* No linings for tenements were granted for the northern and southern districts in 1905, but during the past year three linings were passed for 195 apartments, with a valuation of 79,360*l.* The Queen's Park and Maryhill districts show only a slight falling-off in comparison with the previous year. In regard to other classes of buildings it will be found that in 1906 100 linings were granted for warehouses, works and stores, valued at 289,373*l.*, compared with 125 linings and a value of 376,715*l.* in 1905. For churches, halls and schools twenty-six linings were passed, with a value of 90,425*l.*, as against ten linings and a value of 72,400*l.* in the previous year; while for public buildings nine linings, with a value of 65,230*l.* were granted, against twenty linings and a value of 103,515*l.* in 1905. In regard to alterations and additions to buildings there were 221 applications, and the valuation of these was 175,810*l.*, whereas in 1905 the applications numbered 221 and the valuation was 303,951*l.* During the year 9,784 lineal yards of streets have been added to the city.

NEW DIARIES.

MESSRS. HUDSON & KEARNS's diaries, to which we have quite recently referred in noticing their blotter, are as usual to hand, and no architect or builder can well afford to be without one; they have been produced in Messrs. Hudson & Kearns's best style, and this should be sufficient indication that both printing and paper cannot easily be excelled.

A particularly useful diary published at 1s. 6d. is that issued by our contemporary *The Master Builders' Association Journal*, and entitled "The National Master Builders' Year Book and Diary." The mass of information contained is such that the diary should be found of value in every builder and contractor's office.

We have received a copy of the diary issued by Messrs. Benn Bros., the proprietors of *The Cabinet Maker*. It is printed on good paper, leaving plenty of room for each day's notes, and is bound in a strong and artistic gray cover.

We have received an ivory pocket calendar from Messrs. Robert Boyle & Son, the well-known ventilating engineers. On one side is a small scale giving inches and metrical measurements of value to architects and builders, and on the other the usual calendar.

BUILDING TRADES EXHIBITION, OLYMPIA.

THE forthcoming Building Trades Exhibition, which takes place at Olympia next April, will entirely surpass all the successful exhibitions held biennially since 1895 at the Royal Agricultural Hall. We have had an opportunity of seeing the plans, and find that the whole of the main hall and galleries are definitely allotted and the greater portion of the annexe as well. The list of firms who have taken space is evidence that the exhibition will be thoroughly representative of the building trades, the exhibitors already totalling some 300, which includes many of the leading firms throughout the country. It is gratifying to note that almost without exception the same firms exhibiting at the last show have taken three or four times as much space at Olympia, and everything points to a gigantic success.

Mr. H. Greville Montgomery, M.P., is solely responsible for the organisation of this venture. Finding that the

Agricultural Hall was quite inadequate to accommodate all the applicants for space he arranged to lease London's

largest hall, and even now judging from the applications pouring in for space many firms will be disappointed.

The Lord Mayor will formally open the exhibition on April 6.

WARMING BEDROOMS WITH WASTE HEAT FROM THE SITTING-ROOM FIRE.

A CHEAP and effective hot-water heating apparatus for domestic dwellings has long been needed, and on this account a heat distributor which has been put on the market by Mr. J. D. Prior, of the Empire Works, Holliday Street, Birmingham, appears to have a strong claim to notice. The distributor in question is fixed in the ordinary fire-grate which is in general use and connected with hot-water pipes or radiators fixed in the rooms to be warmed, the apparatus extracting sufficient waste heat from the back of the fire to cause the water contained in the distributor to circulate rapidly through the pipes or radiators and thus warm the rooms.

The distributor is constructed of very strong oblong copper tubes of such a shape that they do not interfere with the radiation of the heat from the fire, and corrugated in a special manner which increases the heating power and forms expansion loops. These corrugated tubes passing through the back of the fire absorb heat very quickly, and the water contained in them rapidly circulates through the pipes leading to the radiators. The tubes are seamless, drawn from best copper and of such a shape and thickness as not to be injured by the poker. Taps are fixed to control the temperature or turn off the heat from any room in which it is not required.

The advantages of such an apparatus are obvious, for it uses the waste heat which would otherwise be lost up the chimney. One fire is sufficient to heat three rooms, and the trouble of lighting extra fires is consequently obviated. The apparatus is easily fixed, and being automatic in action can be put in operation by anyone; in fact, all that is needed is to light the fire in the ordinary way, and the distributor does the rest.

At the Royal Sanitary Congress in July last year this heating appliance was shown in operation, and the judges

awarded a prize medal to both the "Venetian" fire grate and the heat distributor.

Mr. Prior has prepared a descriptive pamphlet dealing specially with this useful invention, and will only be too pleased to forward a copy to any architect or builder on application.

OFFICIAL INFORMATION.

THE Commercial Intelligence Branch of the Board of Trade has been in the habit of forwarding to chambers of commerce, for the confidential use of their members, but not for publication, information to which it has appeared desirable in the interests of British trade to draw attention confidentially. The plan has met with general approval, and the *Board of Trade Journal* announces that it is intended to continue and extend it. In order to attain more fully the purpose of the Board, namely, to reach all British manufacturers or traders interested, it has been decided, on the recommendation of the commercial intelligence committee, to supplement the existing system by opening on January 1 a register at the Commercial Intelligence Branch, 73 Basinghall Street, E.C., of British firms who may desire to receive confidential information relative to their respective trades. British firms desiring to have their names entered on this list should apply to the Commercial Intelligence Branch on the form which has been prepared for the purpose, copies of which may be obtained on application at the offices of the branch.

The admission to the register, as well as the retention upon it, of any firm will be at the discretion of the Board of Trade. It is not proposed to make any charge for information supplied, but every firm admitted to the register will be required to become a subscriber to the *Board of Trade Journal* (and register as such with Messrs. Wyman & Sons, Ltd., Fetter Lane, London, E.C.), in order to insure that those who wish to receive confidential information should first be in possession of all the official information relating to their particular trade which is published in that Journal. The present scheme is provisional and experimental, and its continuance and future development will depend on the results of experience.

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Tests

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name of "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

GENERAL IRONFOUNDERS, Ferham Works, ROTHERHAM.

London Showrooms, Saracen's Head Buildings, Snow Hill, City,

W. B. CLARKE, Agent.
where the "Drawwell" can be seen in action.

MANCHESTER CITY COURTS.

THE report for 1906 of the offices committee of the Manchester City Justices contains several suggestions as to the improvement of the arrangements of the city courts. The committee think that the room used formerly as the coroner's court could be used as a separate court for children and as a bail or summons court during the sitting of Quarter Sessions. The clerks' offices, it is stated, are exceedingly cramped. They were built thirty-six years ago, when the area of the city was about 6,000 acres, and they are now too small for a city three and a half times that size, with a present population of 637,000. There is every probability, too, that in the near future it will be necessary to appoint an additional clerk. The committee recommend alterations to meet these additional requirements. As to the Licensing Sessions they say:—Great inconvenience is experienced at these times owing to the lack of one large court specially suited for civil business, as the dock takes up the whole of the centre of the court and is not available for either sitting or standing room. The position of the building is such that there can be no expansion laterally, and it is worthy of serious consideration as to how additional accommodation shall be provided.

The committee sent to the City Council a copy of a resolution which stated that it is desirable that the streets surrounding the courts should be paved with such pavement as would lessen the noise, which at present is detrimental to the interests of justice. This was referred to the street paving committee of the Corporation, who replied that they regretted they were unable to entertain the suggested alteration, but they would again consider the matter when next the streets required extensive repair.

NOTICE OF ACCIDENTS ACT.

THE Home Secretary has given notice that he has appointed January 1, 1908, as the date on which Section 1 of the Act (relating to the annual return of accidents to be made by owners of mines and quarries) shall come into operation.

He also gives notice that he has made orders, dated December 22, extending the provisions of the Act requiring

notice of accidents to be given to an inspector to the following classes of occurrences, whether personal injury or disablement is caused or not:—

(a) In Mines and Quarries.—All cases of gas or dust below ground other than ignitions of gas in a safety lamp; of fire below ground; of breakage of ropes, chains or other gear by which men are lowered or raised; of overwinding cages while men are being lowered or raised; of inrush of water from old workings.

(b) In Factories, Workshops, &c.—All cases of bursting of a revolving vessel, wheel, emery wheel, or grindstone moved by mechanical power; of breaking of a rope, chain, or other appliance used in raising or lowering persons or goods by aid of mechanical power; of fire affecting any room in which persons are employed and causing complete suspension of ordinary work therein for not less than twenty-four hours.

AUSTRALIAN TIMBER.

THE special agent of the United States, Mr. H. R. Burrill, in a report to the Bureau of Manufactures, Washington, on the commerce of Western Australia, says that the timber industry is still in its infancy; but from the latest and most accurate figures obtainable showing its production enough can be learned to gauge its importance and value as a national asset and the steady rate of its development. The demand for Western Australian hard woods for railway sleepers, street-paving blocks, piles for wharfs and piers, jetties, bridges, &c., is increasing both in the Commonwealth and for export. The United Kingdom is the chief buyer of these woods outside of the Australian States, but a fairly large quantity finds its way into foreign countries. A recent Government estimate gives 8,000,000 acres of jarrah forest and 1,200,000 acres of kauri forest, and the latest published records of the Western Australian Land Department indicate an acreage of only 904,260 of forest land under timber leases and licenses. These figures show the great expansion possible for this industry under intelligently directed effort, and its increasing importance as a source of State wealth. No foreign hard wood can hope to compete with the Australian kinds.

CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up the sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead-air spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT.

PORTLAND STONE.

THERE is fitness in the Bath Stone Firms, Ltd., becoming the possessors of extensive quarries at Portland, because Bath stone and Portland stone are allied in being oolitic limestones. Oolite as a title is not to be displaced. But if the beds were described as producing roe-stones everyone would understand what the title conveys. The Portland beds belong to the upper oolite. Prior to the science of geology being known the name Portland stone was applied, and it is likely to be retained until the beds are exhausted. Inigo Jones would appear to be the first architect who realised the unique value of Portland stone, especially for work in the City of London. Before his time it was used in Dorsetshire. But when Inigo Jones employed it in the Banqueting-house at Whitehall a new era was opened for the material. Afterwards, when ordered to restore Old St. Paul's, he used Portland stone for his noble Corinthian

is evidence of the care taken by Wren in the selection of the stone. There is a tradition that all the stone he used for St. Paul's was tested by being left on the beach of the island for three years, and blocks which showed signs of deterioration through wind or water were rejected. At a subsequent time less care was taken in the selection of the stone, and in consequence a prejudice was excited against Portland, which however has long since passed away.

Anyone who has examined the quarries on this island must have perceived the unusual quantity of ridding and broken stone, which of necessity has to be removed before the true Portland Whitbed is reached. The Whitbed varies in thicknesses from 3 to 9½ to 10 feet, and this famous building stone is obtained in blocks sometimes up to 10 tons in weight. In a few quarries the lower beds yield stone which is termed Basebed; this is much softer than the Whitbed, and should only be used for interior work. The careful and skilful way in which this prime Portland stone

THE BATH STONE FIRMS' COMBEFIELD QUARRIES, PORTLAND.

From which the stone was taken for some of the large Government buildings in London.

portico as well as for other parts. The stone found no less favour in the eyes of Wren. He said that an inquiry was made after all the good stone which England afforded to be used in the rebuilding of St. Paul's, and that all the most eminent masons of England were of opinion that stone of the largest scantlings was to be found in Portland or nowhere. Wren, indeed, if he had his way would not have allowed a quarry to be opened in the island without the authority of the Crown officials until he had secured all the stone required for the cathedral, the Royal Hospital at Chelsea and his City churches. He would not recognise private rights, and this led to some dispute with quarry-owners and the inhabitants of the island. The way in which Portland stone has resisted the London atmosphere

is extracted by the quarrymen employed by The Bath Stone Firms, Ltd., who are all both experienced and qualified men, and assisted by the natural fissures, shows the advantage in having an established and reputable company quarrying and supplying this fine building stone in unlimited quantities.

From their great experience in the demand for the Government buildings, they adopt the best way for obtaining large and sound blocks, and there is, moreover, security for watchfulness for any defects in their Portland stone, which would be prejudicial to their interests in the immense undertakings at Bath, Corsham, Monk's Park and Box in the counties of Wilts and Somerset, with which the name of the company is associated.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tender and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50l. and 25l. to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10s. 6d. Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

GORTON.—Jan. 19.—Architects who wish to submit designs in limited competition for the Thornwood Avenue Council school should apply before the above date to Mr. W. A. Clegg, Education Office, Town Hall, Gorton.

IRELAND.—Feb. 6.—The Galway Board of Guardians invite plans and estimates of a proposed fever hospital. The premium of 25l. will be merged in the architect's fees if the winner carries out the work. Particulars from Mr. R. F. Mullery, clerk to the Union, Galway.

NEWCASTLE-ON-TYNE.—Jan. 15.—For the North of England Model Cottage Exhibition. Site planning for this exhibition, which is 16½ acres in extent, twelve houses to the acre. Further particulars from Mr. R. Aldridge, c/o Burt Hall, Newcastle-on-Tyne.

SUNDERLAND.—Feb. 1.—The committee of the Sunderland infirmary invite designs for a children's hospital. Premiums of 100l., 50l. and 25l. are offered. Deposit 1l. 1s. Mr. Thomas Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland.

WALES.—Jan. 12.—The committee of the George Edwards Memorial hall, Cefn, Ruabon, offer a prize of 10l. for the best design (including plans and elevations) of the hall. Full particulars may be obtained from Mr. W. Ryland Jones, secretary, High Street, Cefn, Ruabon.

MR. P. M. CROSTHWAITE held an inquiry at the Wolverhampton town hall on Tuesday, on behalf of the Local Government Board, with regard to an application by the Corporation for borrowing powers to the extent of 90,000*l.* to extend the water undertaking. With regard to the cost of the new works, 5,000*l.* had to be paid to the Staffordshire and Worcestershire Canal Company as compensation for tapping their water, the preliminary expenses were put down at 2,205*l.*, and the trial borings at Tettenhall had involved a cost of 2,200*l.* The permanent boreholes, which would be sunk to a depth of 1,000 feet, together with their lining tubes, would cost 6,000*l.*, the triple-expansion engine would mean an outlay of 6,545*l.*, the engine foundation and house 2,000*l.*, and the reservoir, which would hold 6,000,000 gallons, would cost 14,500*l.* It was proposed to lay down a 24-inch pumping main from Tettenhall to Goldthorn Hill, at a cost of 21,000*l.*, and trunk mains to other places; erect cottages at Cosford, and a siding and ropeway at the same place. It was also proposed to provide a water tank at Essington. In addition to the proposed expenditure, it was decided to ask for a loan of 15,000*l.* to cover any capital cost which might be incurred in extending the ordinary service during the next ten years.

ELECTRIC NOTES.

MR. J. DENNIS COALES (from University College, Nottingham) has been appointed Senior Lecturer in Electrical Engineering, Birmingham University, in the place of Dr. D. K. Morris, who has resigned.

MR. RALPH LOMAX has been appointed electrical engineer for the borough of Stockport at a commencing salary of 250*l*. He was the assistant electrical engineer, and he takes the place of Mr. A. Carter, resigned.

THE Parliamentary Bill promoted by the Rawtenstall Corporation for powers to borrow 223,200*l*. for tramway purposes contains 290 clauses and covers 140 pages. It is not much smaller than the Leeds Corporation's Bill of a year or two back, which constituted a record for bulk, and which cost 10*s*. a copy to print.

THE tramways committee of the York City Council reported on Monday that after protracted negotiations they had, subject to the approval of the City Council, agreed to purchase the existing undertaking of the City of York Tramways Company, Ltd., at a price of 11,000*l*., upon certain conditions. The report was approved.

THE Blackpool Town Council are going to make reductions in the charges for electricity used for industrial power purposes and in the day tariff charges per unit for lighting, heating or cooking purposes. The committee hope to give greater encouragement to consumers and to induce them to use electric radiators and heaters in bedrooms, &c. The suspense account of 13,500*l*. has been cleared by the profits from the department, and their engineer advised that they had sufficient plant to produce electricity at great profit for day use. The profit from the department towards the rates last year was 6,000*l*.

THE City of London Electric Lighting Company have now offered to prove the superiority of up-to-date electrical illumination by lighting Holborn Viaduct and a portion of Farringdon Street at a considerable reduction on the present cost of 26*l*. per lamp per annum. In the area of the City lighted by the improved gas system a saving of 500*l*. a year has already been effected. The Electric Lighting Company has also offered to light the streets outside the Central Markets by the new arc lamp system at 18*l*. per

lamp instead of 24*l*. per lamp, which is now being paid by the Central Markets committee.

A DEPUTATION on Monday waited on the Manchester tramways committee to obtain particulars of the Tramways Bill which it is proposed to lay before Parliament and to suggest certain alterations in it. The chairman of the committee explained the proposals of the committee, and said they considered the extensions necessary in the interests of the whole public of the city. The whole of the work would be completed for the amount specified (50,000*l*.), and he expressed his willingness to eliminate from the Bill the clause which would provide for further borrowing powers.

THE retirement of Mr. John Gavey, C.B., the engineer-in-chief to the Post Office, will deprive the public service of a most distinguished electrical engineer. He began his career with the Electric and International Telegraph Company in 1860, and in 1905-6 he was President of the Institution of Electrical Engineers. The work by which he will be remembered at the Post Office is (1) as the father of the Post Office telephone system in London; (2) as the man under whose direction the great underground telegraph system between London and Glasgow, which has proved such a benefit during the past week, was carried out; and (3) for his work in connection with wireless telegraphy. Outside St. Martin's-le-Grand Mr. Gavey's ability is well known.

At the meeting of the Metropolitan Asylums Board on Saturday Mr. R. Strong presented a report from the asylums committee with reference to the electric lighting of the asylum at Tooting Bec. The asylum is lighted by electricity generated on the premises by gas engines. Additional buildings at the asylum are now approaching completion, and if the whole of the institution is to be lighted by electricity generated at the asylum extra electrical plant will be required, which is estimated by the engineer-in-chief to cost, in round figures, 1,000*l*., in addition to an increased charge of about 24*l*. per annum and an increased annual expenditure on staff, &c. In moving the adoption of the report, recommending the acceptance of an offer by a company to supply the asylum with light and power, Mr. Strong contended that the course proposed was the wisest and most economical that could be adopted. The Board agreed.

SUMMER DRIED SEASONED BATH STONE FOR WINTER USE.

THE Salford Borough Council have adopted the recommendations of the electricity committee in regard to the appointment of a successor to Mr. C. D. Taite, who has resigned his position as electrical engineer on receiving a new appointment. Mr. Taite had asked to be relieved from his duties on December 31. The committee recommended that the request be acceded to on condition that Mr. Taite undertook to attend their meetings when his report as to the proposed extensions of the generating plant was under consideration, and also to supervise the installation and testing of the turbo-generator. They proposed to pay him a fee of 100 guineas for these services. The committee had also approved a draft advertisement inviting applications for the position of electrical engineer at a salary of 800*l.* per annum, rising by annual increments to 1,000*l.*

THE Dundee Corporation have received a report from Mr. H. Richardson, electricity engineer, Dundee, on the subject of the proposed new generating station. The probable first required cost would be considerably under 50,000*l.*, not 100,000*l.*, as had been reported, and the entire amount would not have to be spent as a lump sum. It was, moreover, not intended that the new station should be for the supply of power to mills specially, the prosperity of electrical matters being absolutely independent of any loads which might be got from the mills. Further, the new station would have that desirable elasticity which would enable the department to cope with any large and profitable loads. The present system of distribution did not allow this except where such a load was close to the station. The proposed system would also enable them to supply many an odd 50, 100 or even 200 horse-power which could not possibly be done at present, to say nothing of the opportunity it would give the department of supplying areas which were not served economically and properly now.

A PROPOSAL to take a supply of water from Lochend Loch for condensation purposes in connection with the electric lighting of Edinburgh was discussed on the 4th inst. by representatives of Edinburgh and Leith Town Councils. The Leith representatives put forward the objections that the loch was insufficient for the purpose; that Leith Town Council, who claimed to have a servitude over it; already used water from the loch; that the proposed arrangement for returning the water after use in the electric-

lighting works would raise the temperature of the loch and spoil it for other purposes; and that it would prejudice Leith should they wish to use the water for a similar purpose at any time. In reply to these objections, it was pointed out that as the water would only be used in winter, the amount taken would not materially affect the temperature, and that this amount was greatly over-estimated in being put at 2,500,000 gallons per day.

VARIETIES.

THE master builders of Melbourne reopened their works last week on the old conditions, with forty-eight hours' work weekly. Only a few non-unionists resumed work.

A LOCAL GOVERNMENT BOARD inquiry has been held at Newcastle into the Corporation's application for power to borrow 8,433*l.* for the erection of a police-station at Walker.

THE War Office has received the sanction of the Treasury for the spending of the money necessary to enlarge the Royal College at Sandhurst, with a view to the more thorough training of cadets.

A NEW publication has appeared entitled *Installation News*, which frankly acknowledges that its sole object is to make clear the many advantages of the Simplex conduit system. It is rare to find electricity made so entertaining.

A LOCAL GOVERNMENT BOARD inquiry was recently held at North Shields into an application by the Tynemouth Corporation for sanction to borrow 6,000*l.* for the construction of a new road from Hawkey's Lane to Billy Mill Lane, at the west end of the borough. There was no opposition.

THE Cheshire education committee are about to erect new schools at Wilmslow which will include a classroom for the instruction of 100 children in supplementary courses in housecraft, metalwork, applied drawing and practical elementary science.

IN connection with the Cannon Street improvement, Manchester, the finance committee and the improvements committee have decided to purchase property for 7,000*l.* in order to prevent the letting on lease of a part of the property for a term of years and the consequent postponement of the completion of the improvement.

MANCHESTER ROYAL INFIRMARY.

THE Haslingden Board of Guardians, in view of possible variations in the treatment of vagrancy and of some announcement, when the Budget is brought in, on old-age pensions, have postponed for four months further consideration of a proposal to build a new infirmary at a cost over 27,000*l.* The present infirmary is overcrowded.

THE work of constructing the experimental portion of undercliff drive from the east side of the Bournemouth to the Meyrick Road steps was begun last week. The accepted tender for this portion of the work is 16,900*l.* The larger scheme contemplated is estimated to cost about 200*l.*

A LIST has been prepared by the district surveyors in Manchester of new or extended roads of a minimum width 16 yards, and suitable for the planting of trees, and in view of the resolution of the City Council in June last the works committee have been requested by the improvements committee to consider the desirability or otherwise of planting trees in these roads.

A SETTLEMENT has been arrived at in respect to the claim made by Sir William Hulton against the Bolton Corporation for land required in connection with the waterworks scheme at Longworth. Sir William claimed 140,000*l.*, and the matter was to go to arbitration in London. The Corporation have now decided to purchase the whole of his estate, which is over 1,600 acres.

THE Birmingham Corporation have received a return of the work done by the housing committee from January 1902 to the end of December, 1906:—Represented by medical officer of health, 3,195; closing orders obtained, 13; houses rendered habitable, 1,157; undergoing repair,

338; notices unexpired, 1,153; converted to workshops, 31; repaired without notices, 267; demolished, 519.

A MOVEMENT has been started for erecting in "every town in the kingdom" a mural drinking fountain as a memorial of the late Sir Wilfrid Lawson. It is proposed that the fountains should be constructed of Cornish granite in England, Aberdeen granite in Scotland, and Castlewellan granite in Ireland, but that the stone for the medallions and entablatures should come from Cumberland.

A COMMUNICATION has been received at Swansea from the Postmaster-General offering 22,000*l.* for the purchase of the Swansea municipal telephone system. Recently a deputation of the Town Council waited upon the Postmaster-General regarding the matter, and urged that the town should be repaid the whole of the capital expended, which up to March last amounted to 27,172*l.*

THE Alton (Hants) Rural District Council have received a cheque for 3,867*l.* for extraordinary damage done to the roads in the vicinity of Borden Camp. This brings the total claims paid to the Council by the War Department since 1903 up to 8,285*l.* The Hampshire County Council and the Petersfield Rural District Council have also large claims for similar damage, the outstanding total being over 20,000*l.*

THE Coventry Corporation desire to acquire the old post office in Smithford Street for the purpose of providing a corn exchange. A provisional agreement has been entered into by the Corporation with the Postmaster-General whereby the former will acquire the freehold of the old post office for 3,500*l.* The proposed exchange will be on the first floor, and the ground floor will be adapted for shops.

THE Socialist members of the Accrington Town Council on Monday objected to a contract for tramcars and car equipment, involving an outlay of 19,450*l.*, being given to the Brush Engineering Company, Loughborough, because there was a wages dispute at the Brush Company's works between the firm and a certain section of the men who made the bodies of the cars. The majority carried the recommendations of the committee.

A CONTROVERSY has arisen in New York between the plumbers and steam-fitters as to whose class the installation of vacuum cleaning system piping in buildings

belongs. The plumbers lay claim to this work for the reason that connection is made from these systems to the sewers, while the steam-fitters maintain that the system is analogous to compressed air piping systems and properly belongs to them.

THE contract for the cutting of the track and laying the cast-iron pipes to carry the underground telegraph cable between Edinburgh and Linlithgow has been obtained by Mr. Andrew Blair, contractor, Bath Street, Glasgow, who has all the necessary plant on the ground and only awaits the delivery of the pipes to make a start with the work, which has to be completed by April.

THE Office of Works, Whitehall, will, in the course of a week or more, commence operations in the building of the new Central Post Office, on the site of Christ's Hospital, Newgate Street. The site, which has already been cleared, comprises three and a half acres, but it is proposed to cover not more than two acres with buildings. It is estimated that at least three years must elapse before the new post office is completed.

THE works sub-committee of the highway and sewerage committee of the Sheffield City Council have had under consideration the question of the estimates for the next financial year. They again want 85,000*l.*, but point out that this sum includes many other works besides highways, viz. sewers, sewerage, scavenging and rebates on private street-works, which absorb more than half the total vote and leave only from 37,000*l.* to 39,000*l.* for the upkeep of 238 miles of streets.

THE Consul-General at Antwerp intimates that the municipal authorities of that city invite tenders for the construction of eight houses adjoining the new public hall at Antwerp and the completion of the latter building, at an estimated cost of 1,246,650 francs (about £49,862). A deposit of 60,000 francs (about £2,400) is required. The specification (cahier de charges No. 1183) may be obtained from the Hôtel de Ville, Antwerp, at a cost of 5 francs (4*s.*), and the plans at a cost of 200 francs (8*l.*).

DURING the twelve months ending October 31 there were thirty fires in Boston in warehouses and manufacturing risks that were equipped with automatic sprinklers. It is stated that in no one of these buildings was the property

valued at less than 50,000 dols., while in a number of instances the insurance upon building and contents amounted to hundreds of thousands of dollars, yet the aggregate loss in these thirty fires was only 5,722.74 dols., or an average loss of 190.75 dols. per fire.

THE indispensable "Whitaker's Almanack" for the current year is replete with information on multifarious subjects, and ample facilities are afforded for ready reference. Important new matter has been introduced, whilst some of the articles previously included have been enlarged to meet modern requirements. The book, it may be added, has been rigidly supervised, and the information contained therein has been brought down, as far as practicable, to the latest possible date.

THE North-Eastern Railway Company's new goods station in New Bridge Street, Newcastle, is now open for all classes of traffic. Part of it has been in use since October. It is built of ferro-concrete and is 430 feet long, 178 feet wide and 83 feet high. There is a basement warehouse with an area of 75,000 square feet. On the ground floor there are six lines of rails, providing accommodation for 120 waggons, and there is standing room in the yard for 280 waggons. The first and second floors have a total area of 140,000 square feet, of which 40,000 square feet will be utilised for the storage of grain and flour.

ON New Year's day the Great Central Railway Company added to its mileage by taking over the Lancashire, Derbyshire and East Coast Railway. It is well known what an important piece of line has been acquired, and it is considered that under its new management great development will take place with regard to the shipment of coal from Grimsby. The Great Central Co. will benefit in Sheffield, as the large goods depot at Attercliffe, formerly the property of the Derbyshire Co., will be at the disposal of the Great Central, and will increase its facilities for dealing with general merchandise. We understand Mr. Willmott, the late manager of the L. D. & E. C. Co., still remains manager of the Sheffield District Railway, with offices in Sheffield.

PLANS have been prepared for the erection in Birmingham of a Labour Institute, providing trade union offices and a social club. The scheme is being promoted by the B.

ingham Trades Council, and a meeting of those interested will be held on February 9. The site of the proposed building is in Bristol Street, with a frontage to that thoroughfare of 82 feet and to Bellbarn Road of 68 feet. It is estimated that the cost of the building will not exceed 8,000*l.* It is expected that there will be annual income from the building of 520*l.*, and the expenditure, providing 70*l.* for ground rent, 320*l.* interest on capital at 4 per cent. and 50*l.* rates and taxes, will leave a surplus of 80*l.*

The attitude of the Southport Corporation towards the unions of the town has been strongly criticised at a meeting of the Trade and Labour Council. It was complained that the Corporation usually wanted a man to work 4*s.* or 5*s.* a week less than the standard rate, and obviously enough they succeeded in getting men. It was said the Corporation was closed to trade union joiners as to other unionists, and if a man wanted work under him he had to sever his connection with his union. The Corporation actually competed with the builders of the town and took work out of their hands. They dictated that all contractors should pay the standard rate, while they themselves declined to do so. A resolution calling upon the Town Council to pay the standard trade union rates to all their employes was passed unanimously.

The increase of wages recently granted to the Birmingham Corporation employes amounts to 5,800*l.* a year. The workmen asked for an advance of 2*s.* a week, and the matter was referred to a joint committee comprising representatives of the principal unskilled labour-employing committees of the City Council. This committee recommended that the wages of all Corporation workmen receiving 25*s.* a week or under should be increased 1*s.* a week, that those men receiving between 25*s.* and 26*s.* should be advanced to the latter sum, and that the minimum rate for adult unskilled labour should be raised to 24*s.* per week. The number of men affected in the employ of the public works department is 930, gas 575, health 385, water 152, baths and parks 70, electric supply 60, tramways 27; total, 2,199. The advances varied from 4*s.* a week to 2*d.* per week, and the official return shows that the additional cost in wages amounts to more than 100*l.* per week, or roughly 5,800*l.* per annum, a sum which is nearly equal to a halfpenny rate.

THE Hereford Town Council have decided that the following fair wages clause shall be inserted in all future contracts:—"The contractor shall pay the recognised trade union rate of wages to all fully qualified workmen, except to such as are partially incapacitated by age or injury, or in the case of an industry with which no trade union is connected he shall, with the above exception, pay the rate of wages current in the district where the work is executed, such rate being, in the case of local contracts, not lower than that paid by the Hereford Town Council for similar work. The contractor shall not sublet any part of the contract to any person not complying with the foregoing conditions; the contractor shall forfeit a sum of 1*l.* in respect of every breach of this covenant; the sum forfeited under this condition, if not previously paid by the contractor, shall be deducted out of the next payment due to him."

THE members of Edinburgh Dean of Guild Court had under consideration, at a private meeting recently, the first part of a series of clauses and regulations which they propose to transmit, when completed, to the Town Council, with a view to their being embodied in and promoted as a provisional order. The proposals of the Dean of Guild Court imply that the suggested provisional order would be of a comprehensive character—not only codifying existing regulations but also enlarging the powers of the court with respect to the formation, maintenance and regulation of roads and the erection of buildings. Several pages of the draft of the proposed clauses were gone over *seriatim* and tentatively approved. Among the principal clauses that have so far been considered are provisions for the prevention of *cul-de-sac* streets and for the preservation of the amenity of districts where new buildings are being erected.

THE Association of Master Painters in Scotland held their annual conference in Glasgow. The general committee for 1906 in their report as to the state of trade were of opinion that it had been, on the whole, fairly good, and had shown a slight improvement upon the previous year. In many industries prospects had been brightening during the past six months, although the recent strike in the Clyde shipbuilding yards, had it continued, would have blighted

Are you interested in WOOD PRESERVATION?

Apply to the ANTHROL Company, Kinning Park, Glasgow, and you will receive an interesting booklet on the subject, which gives a full account of the remarkable properties of ANTHROL and describes the very simple and inexpensive methods by which it is applied. It is an antiseptic preparation which protects any kind of wood impregnated with it from decay in both damp and dry situations, and from the ravages of all wood-destroying organisms in either temperate or tropical climates.

ANTHROL

The result of much practical experiment has shown it to be the most efficient and economical means for preserving any variety of structural timber which it is impracticable or undesirable to have creosoted under pressure. ANTHROL does **not** require expensive pressure-plant; does **not** reduce the mechanical efficiency of the timber; does **not** increase the liability of the wood to inflame; does **not** render the wood poisonous to human beings or domestic animals; and does **not** leave the surface of the wood black and unpleasant for handling—on the contrary, ANTHROL, while protecting from decay, at the same time greatly improves the appearance of wood, and may be varnished or painted if desired.

The **ANTHROL** COMPANY, Kinning Park, GLASGOW; and 6 Crosby Square, LONDON.

that. Fortunately for the West of Scotland, at any rate, that disturbing element had passed, and the committee trusted that with the advent of a new year there had come for both masters and men in the painting trade a period of increased and increasing prosperity. It was pleasing to state that, so far as the Association was concerned, there had been no serious conflicts between masters and men. The committee understood that throughout Scotland the arrangements as to wages and conditions of employment for journeymen during the year 1906 had been renewed for the current year.

MAJOR J. STEWART, R.A., held an inquiry at the Leyton town hall on Monday into an application by the District Council to borrow 1,320*l.* for the construction of a new road to the site of a proposed bridge over the waterworks river at Hackney. The clerk, Mr. R. Vincent, said the road was part of a scheme for increasing the highway communication between Leyton and the Metropolis, *via* Hackney, which was the most direct route. At present the only road available was the private toll at Temple Mills, and great inconvenience was experienced by the inhabitants of Leyton, who, to avoid payment, must travel by the very roundabout Stratford or Clapton roads. The Hackney and Leyton Councils had agreed to make roads to the river, across which it was hoped that the London County Council would build the bridge, of which the cost was estimated at about 5,600*l.*

THE Birmingham Trades Council at a meeting on Saturday adopted the following resolution, submitted by the special sub-committee appointed to consider the question of sub-contracting:—"That, with a view to a more stringent observance of the fair wages clause, and to avoid as far as possible the evils resulting from sub-contracting, this Trades Council respectfully urges upon the City Council the great need of insisting that in all contracts where sub-letting does occur such sub-contractor shall sign his contract at the same time and place as the original contractor. Further, that all sub-contracting shall be abolished excepting in those trades where the sub-contractor provides the material necessary for the carrying out of the sub-contract, and that the City Council be asked to amend the fair wages clause in accordance with the terms of the above resolution."

ELECTROLIERS.

FROM the Edison and Swan United Electric Company we expect novelties in fittings. They have lately placed on the market piano standards which are also adapted for use as reading desks or on tables. One of their great advantage is that by means of hinged joints they can be adjusted at any angle, while the natural shell shade secures the eye against the brilliant light which can be thrown on a book of music or paper. They are made of polished brass, and is needless to say the workmanship is of excellent quality. One new electrolier is well adapted for houses in the Adam style, and the flame globe is both suitable and novel. Another, which has a more free style of metalwork, the tulip has been used as a motif for the pendent lights. The fittings are deserving of praise.

NEW CATALOGUE.

THE "Mork" Patent Pulley Block Company have issued descriptions of their very ingenious inventions. There are several kinds. There is the worm-gear pulley-block, in which the worm-wheel cannot be thrown out of gear. The new "Mork," on the contrary, allows the worm-wheel to be lifted out of gear and to remain so until by a slight pull at the endless hand-chain it is again set into gear. When the worm-wheel is out of gear, the idle bottom block can be overhauled with the greatest speed, or the tackle may be used like an ordinary gin-block for lifting light loads. The block is also fitted with a patent friction-brake of a very simple and effective design for sustaining the load. The main feature in it is a leather washer, and by substituting a thicker or thinner washer, the sustaining power of the brake may be increased or decreased. This is extremely valuable where the blocks are only to be used for lowering. In the latter case a thin washer is substituted for the thick one, and the loads may then be lowered quickly and without even having to pull at the hand-chain. The company also produce electric travelling pulley-blocks which are adapted to motors of various horse-power. All the parts of the pulleys are admirably adapted to their purposes. The strength is in the right positions and the parts are accessible for oiling.

DECORATIVE CONTRACTS.

THE volume which is filled with representations of some of the buildings decorated by Messrs. Waring must gratify every Englishman when he finds that the firm can count several Paris buildings among their successes. To be selected to execute a class of work in which Frenchmen are supposed to be supreme speaks well for the artistic power which Messrs. Waring can command. Some of their work is found in other cities abroad. The English buildings shown in the book, and for which the contracts were secured mostly in public competition, comprise palaces, hotels, clubs, theatres, restaurants, infirmaries, public buildings, steam vessels, yachts, &c. Their work is to be seen in the private apartments of Windsor Castle and Buckingham Palace, the King's yacht, the German Emperor's yacht, the Sultan of Turkey's yacht and State barge. They can claim that "no English decorative firm has ever gained such pronounced distinction at foreign exhibitions." The illustrations are all reproductions of photographs, and are therefore free from imaginative features. As examples of the latest styles of decorations adapted to varying circumstances they are of great value and a tribute to the good taste of the firm.

NEW PAINTS.

THERE is a prejudice among operative painters against all paints which do not combine. Whatever may be the advantages of that practice, it does not insure uniformity of colour, and time is lost in experiments. Messrs. Pinchin, Johnson & Co., Ltd., have taken some pains by numerous experiments to establish standard colours. They are adapted to the majority of purposes, but as the materials employed are pure in character they can be adapted with little trouble to all kinds of use. The Minerva paint herefore claims to be recognised on account of the economy in time and money which it insures.

PRESIDENT ROOSEVELT ON TECHNICAL TRAINING.

IN his annual message President Roosevelt said it would be impossible to overstate (though it is, of course, difficult quantitatively to measure) the effect upon a nation's growth to greatness of what may be called organised patriotism, which necessarily includes the substitution of a national

feeling for mere local pride, with as a resultant a high ambition for the whole country. No country can develop its full strength so long as the parts which make up the whole each put a feeling of loyalty to the part above the feeling of loyalty to the whole. This is true of sections, and it is just as true of classes. The industrial and agricultural classes must work together, capitalists and wage-workers must work together, if the best work of which the country is capable is to be done. It is probable that a thoroughly efficient system of education comes next to the influence of patriotism in bringing about national success of this kind. Our Federal form of Government, so fruitful of advantage to our people in certain ways, in other ways undoubtedly limits our national effectiveness. It is not possible, for instance, for the National Government to take the lead in technical industrial education, to see that the public school system of this country develops on all its technical, industrial, scientific and commercial sides. This must be left primarily to the several states. Nevertheless, the National Government has control of the schools of the district of Columbia, and it should see that these schools promote and encourage the fullest development of the scholars in both commercial and industrial training. The commercial training should in one of its branches deal with foreign trade. This industrial training is even more important.

It should be one of our prime objects as a nation, so far as feasible, constantly to work toward putting the mechanic, the wage-worker who works with his hands, on a higher plane of efficiency and reward so as to increase his effectiveness in the economic world and the dignity, the remuneration and the power of his position in the social world. Unfortunately, at present, the effect of the work in the public schools is in the exactly opposite direction. If boys and girls are trained merely in literary accomplishments, to the total exclusion of industrial, manual and technical training, the tendency is to unfit them for industrial work and to make them reluctant to go into it or unfitted to do well if they do go into it. This is a tendency which should be strenuously combated. Our industrial development depends largely upon technical education, including in this term all industrial education, from that which fits a man to be a

good mechanic, a good carpenter or blacksmith, to that which fits a man to do the greatest engineering feat. The skilled mechanic, the skilled workman, can best become such by technical industrial education. The far-reaching usefulness of institutes of technology and schools of mines or of engineering is now universally acknowledged, and no less far reaching is the effect of a good building or mechanical trades school, a textile or watchmaking or engraving school. All such training must develop not only manual dexterity but industrial intelligence. In international rivalry this country does not have to fear the competition of pauper labour as much as it has to fear the educated labour of specially trained competitors, and we should have the education of the hand, eye and brain which will fit us to meet such competition.

In every possible way we should help the wageworker who toils with his hands, and who must (we hope in a constantly increasing measure) also toil with his brain. Under the Constitution the National Legislature can do but little of direct importance for his welfare save where he is engaged in work which permits it to act under the interstate commerce clause of the Constitution, and this is one reason why I so earnestly hope that both the legislative and judicial branches of the Government will construe this clause of the Constitution in the broadest possible manner. We can, however, in such a matter as industrial training, in such a matter as child labour and factory laws, set an example to the states by enacting the most advanced legislation that can wisely be enacted for the district of Columbia.

COLONIAL BUSINESS.

It is to be regretted that only a comparatively limited effort is made to obtain orders in the colonies. Germans and Americans secure in consequence a large amount of business to which Englishmen have prior claims. One of the causes for the apparent indifference is no doubt the belief that commercial travellers and other agents have not the freedom which is allowed to representatives of all countries in Great Britain. The Blue Book just issued, containing the regulations in force in British possessions and protectorates and foreign countries with regard to British commercial

travellers is therefore a boon to manufacturers. The following will suggest its character:—

In the Australian Commonwealth commercial travellers' samples are liable to the ordinary rates of import duty, but the amount may be deposited with the Customs for a period not exceeding six months, such amount being returned if the samples are exported within the prescribed time. A certificate to the effect that the duty has been paid, deposited will be recognised throughout the Commonwealth if the samples can be readily identified on transfer. It is not necessary that the samples should be exported from the port at which they were imported. Special conditions prevail with regard to railway facilities in the various States.

Commercial travellers, whether representing one or more firms, are required on arrival in New Zealand to pay a deposit—usually about 5%—as a guarantee that the income tax due on the business done in the colony will be paid. The deposit is held until the traveller is in a position to furnish a return of the total business resulting from the visit, when an adjustment is made by refund if the deposit exceeds the tax payable, or by a claim for the balance of tax if the deposit is less than the amount payable. On his arrival the traveller receives a warrant (free) permitting him to exercise his calling. Principals are subject to the same provisions as their agents. On New Zealand railway commercial travellers are allowed 112 lbs. of luggage and samples free of charge, any excess over that up to 10 cwt. being charged at 6d. for every 56 lbs. or fraction of 56 lbs. for every fifty miles or fraction of fifty miles, being half the rate charged to the ordinary public. Resident agents of British firms are not subject to any license fee for income tax purposes, and in their own private assessments are entitled to an exemption of 300%, the same as any other resident.

Duty is usually charged at the first port of entry into the South African Customs Union on all samples of commercial value brought into the country by commercial travellers. Sometimes a deposit is accepted in lieu of duty, such deposit being refunded on exportation of samples, but in this case the samples must be exported at the port of original entry where the deposit was taken. If the commercial traveller wishes to visit any colony in the Customs Union, other than that in which he has landed, he has to provide himself with

schedule in due form, and also to make out Customs union forms. This done he can proceed to any part of the Customs Union without further payment, the only condition being that should he dispose of any of his samples the particulars of such sale must be endorsed by him on the schedule, so that the colony in which the sale took place may receive its share of the duty originally collected.

All commercial travellers visiting Cape Colony are required to take out licenses, but the particular license they may require depends upon the nature of their operations.

A license of 25*l.* per annum available from January 1 to December 31, or one of 12*l.* 10*s.* available from July 1 to December 31, is required by all persons other than importers who sell or offer for sale by sample or otherwise goods of a firm whose place of business is not in Cape Colony. An agent holding a single license may sell the goods of any number of firms; agents for local firms are allowed the usual small samples without holding a liquor license.

DUST-LAYING EXPERIMENTS.

A REPORT of dust-laying experiments made by the city surveyor of Chester has appeared on the minutes of the improvement committee. The surveyor stated that the committee received an offer from the Akonia Syndicate to supply four tons of akonia on approval. The experiment was made on Upper Northgate Street and Liverpool Road, and began on July 30 and continued until August 27. The total weight of akonia used was 4 tons 3 cwt. 3 qrs., and, inclusive of the first thorough dressing, it was applied four times with a total of 8,000 gallons of water. During the month when the experiment was being made, it was showery on eight days and heavy rain fell on nine days. The ordinary watering on these roads during the intervals of dry weather, between the rainy weather, would have consumed, approximately, 82,000 gallons of water, as against the 8,000 gallons actually used; but the cost of watering would have been about 3*l.* 10*s.*, as against 14*l.* 8*s.* 5*d.* for the akonia, made up as follows:—12*l.* 18*s.* 3*d.* for akonia; carter's time, 18*s.*; breaking drums and crushing material, 4*s.* 1*d.*, and extra cleansing, 2*l.* 18*s.* 1*d.* There were other expenses not taken in account, such as extra

man with meter stand pipe; but this item could be dispensed with, and other items of expense might be reduced in connection with the future crushing, dissolving and spreading of the akonia solution, should the committee decide to use it on a larger scale. During the season, on all the roadways in the city usually watered, 19,346 loads of water had been applied, at a cost for spreading of about 352*l.* There were about 10 miles of macadamised roadways (being part only of the city roads) that the akonia would be useful upon, but the cost for this material alone at 3*l.* 1*s.* 6*d.* per ton was estimated at 553*l.* 10*s.* The experiment proves, firstly, that the solution when applied to the road surfaces kept them damper and less dusty in dry weather, and less muddy in wet weather, and served for a longer period than ordinary watering; secondly, the water used was very much less than with the ordinary watering; and, thirdly, that the expense of the material was a large factor, considering the water is supplied to the Corporation free of charge. In conclusion, he would recommend the committee to continue this or similar dust preventive experiments next season.

STRENGTH OF SOLDERED JOINTS.

THE strength of soldered joints has been found in thesis tests recently made at the Iowa State College to be a very uncertain quantity, varying widely with the composition of the solder, with the method of making the joint and with the kind of metals joined. It was found, says the *Engineering Record*, that the process known as "sweating" results in a joint of the least strength of any of the methods of soldering; all joints made with pressure were invariably found to be more or less granular or spongy, while those made without pressure are usually smooth and firm. In comparing different compositions of solder, it was found that a solder of 60 per cent. of tin to 40 per cent. of lead was the most suitable for general work in which considerable mechanical strength is required, although the actual strength of the joint was found to depend upon the kinds of metals joined. In a series of joints made on brass and on copper with solders containing from 35 to 70 per cent. of tin, practically all of them broke at loads under 13,000 lbs. per square inch. The

maximum strengths on copper were obtained with 60 per cent. solders, the strength declining rapidly with higher percentages; this peculiarity on copper was believed to be due to the difficulty of maintaining the proper temperature in soldering, as with a slight excess of heat the extreme fluidity of the high percentage compositions of solder cause it to run out of the joint. With brass, on the other hand, the strength increases as the proportion of tin in the solder is increased. In further tests to determine the life of soldered joints under light loads, it was found that joints on brass have a longer life under a given load than those on copper. An interesting feature of the observations made in the tests is that the time taken to break a soldered joint is an important factor in the results secured. All joints will after a short time fail under a stress much less than that required to produce failure at once; it was found in many instances that a decrease of 5 seconds in the total time of testing would increase the strength of the joint from 4,000 lbs. to 5,000 lbs. per square inch, the total time of testing being usually 20 to 25 seconds. The maximum strength obtained was 25,900 lbs. per square inch, in the case of a joint on copper with a 60 per cent. solder, the total time of testing having been shortened to 20 seconds.

A ROAD-TARRING MACHINE.

THE Roads Improvement Association, the Automobile Club of Great Britain and Ireland and the Motor Union of Great Britain and Ireland have arranged to promote a competition for a tar-spreading machine. The rules and conditions of the competition are as follows:—

This competition has been arranged to decide the best means of spreading tar by mechanical means upon existing road surfaces so as to bind the road materials and prevent surface dust.

The merits of the competing appliances will be judged entirely by the results of the operation, the chief consideration being the efficiency with which the tar penetrates the road and the cost of application.

Tarring has so far proved itself superior to any palliative for laying dust, but the method of application by hand is expensive. It involves the use of an excessive amount

of tar and the creation of mud and a small amount of dust of an objectionable character.

Hitherto the general practice has been to remove the loose dust from the surface of the road, apply hot tar and brush it into the interstices of the road surface by manual labour. The road is then covered with sand to prevent the tar picking up on the tyres of passing vehicles. A second coating is required after an interval of six weeks, but in subsequent years only one coating is usually necessary. This system has been applied to many miles of main roads in Kent, Surrey, Middlesex and Hampshire, and on a smaller scale in other districts.

The cost of thus treating a road of an average width of eight yards with two coats of refined tar is between 60% and 90% per mile, or about 60% per mile if a period of three years is taken. It has been pointed out by several county surveyors that it is imperative that the cost of materials and labour should be lessened considerably if there is to be a wider application of tar to roads. It is obvious that an unduly large proportion of the cost of the present method is expenditure on labour. If a mechanical apparatus can be constructed, either in the form of a horse-drawn cart or mechanically propelled vehicle, that would spray the tar upon the road, the labour factor can be reduced very considerably. Such an apparatus should apply the tar more uniformly and cause it to penetrate to a greater depth. The quantity of tar required would also be much less. It is necessary to so far reduce the cost and increase the efficiency that the treatment might be applied to all the principal main roads throughout the country. Efforts to induce manufacturers of municipal appliances to design and submit an apparatus for trial have not proved very successful, hence the suggestion by a leading county surveyor to the Motor Union that automobilists should organise a competition for such appliances. It is hoped that such competition will result in the production of an apparatus that will spray the tar under such pressure as will enable it to penetrate deeply into the road, so as to bind the materials of the road instead of forming a separate coating on the surface, and at the same time reducing the waste of tar and requiring the minimum of unskilled labour.

Such an apparatus would save the present expenditure on road watering, as it would lay the dust far more

CHARLTON, LONDON, S.E.

actually; at the same time it would increase the life of the road by preventing the removal of the loose particles between the stones in the form of mud or loose dust.

Specific rules are laid down for testing the merits of competing systems. Efficiency of the application of the distribution of the tar will be judged from the points of view of (a) the penetration of the road; (b) the equality of the distribution; and (c) the quantity of tar the road is forced to absorb. Other matters to be specially considered are—the cost of application per square yard; sound mechanical construction capable of resisting wear and tear; simplicity of operation, *i.e.* the machine should be capable of being worked by the ordinary road labourers without skilled attendance; ease and efficiency of operation; suitability to varying road surfaces; and immunity from fire risk.

The machine which is adjudged to be the best will be awarded a first prize of 100 guineas and a gold medal, and the next best machine will be awarded a second prize of 50 guineas and a silver medal. Entries are to be received to March 31, the entrance fee being 10*s.* 10*s.*, of which half will be returnable to those who actually compete. The trials will be carried out as far as possible upon ordinary roads of varying characteristics. Vehicles may be either horse-drawn or mechanically propelled, but other things being equal, preference will be given to mechanically-propelled vehicles.

The judges who represent the Council of the Roads Improvement Association are:—Mr. W. Worby Beaumont, consulting engineer to the Automobile Club; Colonel Compton, president of the Institution of Automobile Engineers; Mr. Howard Humphreys, consulting engineer; Mr. Rees Jeffreys, secretary of the Motor Union; Mr. Douglas Mackenzie, consulting engineer; Earl Russell, of the technical committee of the Automobile Club; and Mr. Albert Todd, chairman of the Roads Improvement Association. The following city and county engineers have been appointed after consultation with the Incorporated Association of Municipal and County Engineers:—Mr. John A. Lodge, city engineer, Liverpool; Mr. H. P. Maybury, county surveyor, Kent; Mr. H. E. Stilgoe, city engineer, Birmingham; Mr. W. J. Taylor, county surveyor, Hampshire, and president of the County Surveyors' Society; and

Mr. H. T. Wakelam, county engineer, Middlesex, and past president of the County Surveyors' Society.

BEARING CAPACITY OF EARTH FOUNDATIONS.

AN American investigator, Dr. E. L. Corthell, has been engaged in collecting and analysing the pressures on the foundation beds of certain stable structures. The pressures per square foot to which reference was made are those existing upon what may be called earth foundations, the term "earth" comprising a wide range of materials from that which is little better than stiff mud up to classes of hard clay and gravel nearly equivalent to rock. Although such data, however carefully compiled, include many determinations of questionable value in consequence of uncertain methods of computation, on the whole the results are probably as reliable as could be expected. Computations of actual loads upon foundation beds are never better than closely approximate, says the *Engineering Record*, and that approximation in many cases shades out into degrees of much uncertainty. Fairly good authority can be found for supposing that pressures as high as 22,000 to 28,000 lbs. per square foot are supported on a bed of fine sand under the Washington Monument, but it would probably be a matter of some difficulty to establish either one of those values with any high degree of accuracy, even under the wind pressures in consequence of which the higher of those pressures is supposed to be produced.

Dr. Corthell has rendered the profession a real service in correlating these foundation data, but it is necessary to observe that any such collection of values must, like many other engineering data, be used under the guidance of a well-trained judgment. Foundation pressures are to some extent rather erratic in their manifestations, even if it were possible to determine their exact amounts. It is assumed, for instance, in probably all computations usually made to determine pressures that they are either uniform over the entire foundation bed or parts of the bed, or that if they vary the law of uniform variation of intensity controls them. Any experienced engineer is perfectly well aware that neither of these laws necessarily holds, but that they must be assumed as the only workable hypotheses available. In other words, if such laws are not assumed no

WARING'S

Beg to intimate that they are prepared under the personal direction of Architects, to

BUILD, ALTER OR ENLARGE

Hotels, Public Buildings, & Town & Country Houses of any size.

The feature of their Constructional Work is Soundness and Stability, combined with Rapidity of Execution.

In Waring's vast New Building, recently opened, there are Departments for everything in connection with either Contract or Private Work, and Architects may be assured that their wishes will be faithfully and carefully carried out by efficient workmen under expert supervision.

Waring's manufacturing resources enable them to satisfy Architects' requirements at the lowest tender prices.

NEAR OXFORD CIRCUS, LONDON.

ALSO AT LIVERPOOL, MANCHESTER, AND PARIS.

others can be found to take their places. It is altogether probable that no serious errors are committed in employing such procedures, but it is absolutely necessary for a safe and reasonable treatment of foundation problems that their real nature be recognised. Again, great care should be taken in the interpretation of results. The mere fact that 12,000 or 15,000 lbs. per square foot are safely carried by a bed of sand in one location does not justify any such loading as a general rule. There are many places where such loading should be restricted to an amount not greater than 5,000 or 6,000 lbs. per square foot. These observations hold especially with regard to conditions which may be introduced by deeper excavations in the immediate vicinity of an already completed foundation.

The depth of excavation at which a building is founded upon sand, gravel, clay or other similar material is a most important element, and the results of a recorded safe loading per square foot on such material has little meaning unless accompanied by a full statement of the depth below the surface as well as the nature of the loading applied, also whether the foundation excavation has not created a new surface at a still deeper level, in fact nearly down to the foundation bed itself. Almost any material when not too wet will carry a high foundation load if it is prevented from moving laterally, and a recorded foundation load loses its substantial significance in the absence of information regarding all these collateral conditions. Again, many engineers properly make the rational distinction between total load upon a foundation bed and the abnormal load, *i.e.* the load per square foot in excess of that which the same foundation bed carried prior to any disturbance of the material above it. As a matter of fact, the abnormal load is really the significant load. Clearly any square foot of area, unless surrounding conditions are radically changed, will safely carry a load equal to that imposed on it by the mass of natural material resting upon it before being disturbed. The real essential question is, then, how much in addition to that natural load may safely be imposed? If the material is not too moist to permit a reasonable application of the theory of earth pressure to the case, the computed supporting power corresponding to the abutting force of the adjacent material will convey some idea of the abnormal load to which it may properly be submitted.

The results of such computations, however, must be qualified, like all others of the same class, by good engineering judgment. If the material is wet or otherwise questionable, recourse must be had to the safe loads imposed by other structures under similar conditions or to the best engineering guess that can be made under the circumstances.

It is seen, therefore, that much more information is really needed in analysing and digesting precedents of safe foundation loads than their amounts only. The latter must be most carefully regarded in connection with the surrounding conditions and what is meant by the loads themselves. The effect of water in the supporting material, the depth below the "surface" of the deepest excavation, the character of underlying strata, the conditions under which structures similarly circumstanced have settled, and other influences which would easily swell into a long list, are as important elements of the general problem as the amounts of loading themselves.

According to Dr. Corthell, the pressure of stable structures on fine sand ranges between 4,500 and 11,600 lbs. per square foot, averaging 9,000 lbs. in ten examples; on coarse sand and gravel between 4,800 and 15,500 lbs., averaging 10,200 lbs. in thirty-three examples; on sand and clay between 5,000 and 17,000 lbs., averaging 9,800 lbs. per square foot in ten examples; on alluvium and silt between 3,000 and 12,400 lbs., averaging 5,800 lbs. in seven examples; on hard clay between 4,000 and 16,000 lbs., averaging 10,160 lbs. in sixteen examples; on hard pan between 6,000 and 24,000 lbs., averaging 17,400 lbs. in five examples. These cases show no settlement. Besides the foregoing cases three instances were found in which notable settlement took place in fine sand with a minimum load of 3,600 lbs., a maximum load of 14,000 lbs. and an average load of 10,400 lbs. In clay, principally London clay, in five examples the pressure ranged between 9,000 and 11,200 lbs., averaging 10,400 lbs. In silt and alluvium two cases of settlement were reported with loads of 3,200 lbs. and 15,200 lbs., a wide variation. Three cases of failure on a mixture of sand and clay are given, the pressures ranging between 3,200 and 14,800 lbs., averaging 6,600 lbs. This should be compared with the average of 9,800 lbs., an range of 5,000 to 17,000 lbs. in ten examples, already referred to, in which no settlement occurred.

6-11 IMPERIAL BUILDINGS,
LUDGATE CIRCUS, LONDON, E.C.

Dear Sir,—We beg to call your attention to the above paper, which appeals directly to a large section of public. It is practically a new paper—grafted on two old-established periodicals with which it is now incorporated and gives a full reflection of the building industries. Its pages contain information useful to all; it should be carefully studied from end to end.

Issued to meet the trend of the times at a popular price, it contains as much of everything interesting to engaged in building operations as any of the higher priced papers.

It is not too much to say for ourselves, and we state it with every confidence, that a year's subscription to "THE BUILDING TRADE" is one of the best investments anyone connected with the industry can make.

We trust we may have your assistance in making our new venture a great success, and shall be glad if you will fill up the accompanying Order Form and forward it as soon as possible.

Faithfully yours,

GILBERT WOOD & CO., Ltd.

P. A. GILBERT WOOD, Managing Director.

NOTICE TO ADVERTISERS.

Under no circumstances whatever can the Proprietors of this Journal guarantee alteration of copy if received after the first post on Tuesday mornings, and no proofs can be submitted if copy arrives later than first post on Saturday mornings.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tender and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50*l.* and 25*l.* to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10*s.* 6*d.* Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20*l.* and 10*l.* will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

IRELAND.—Feb. 6.—The Galway Board of Guardians invite plans and estimates of a proposed fever hospital. The premium of 25*l.* will be merged in the architect's fees if the winner carries out the work. Particulars from Mr. R. F. Mullery, clerk to the Union, Galway.

SUNDERLAND.—Feb. 1.—The committee of the Sunderland infirmary invite designs for a children's hospital. Premiums of 100*l.*, 50*l.* and 25*l.* are offered. Deposit 1*l.* 1*s.* Mr. Thomas Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland.

CONTRACTS OPEN.

AUSTWICK.—Jan. 28.—For the mason, slater, plasterer, joiner, plumber and glazier's work required in the erection of various buildings, comprising administration, isolation, laundry, discharge and mortuary blocks, scarlet-fever pavilion, stable and cart-shed, for their new isolation hospital at Ell Meadow, near Harden Bridge, Austwick, for the Settle Rural District Council. Mr. T. A. Foxcroft, surveyor, Town Hall, Settle.

BAGSHOT.—Jan. 28.—For the erection of schoolrooms, vestries, &c., for the Wesleyan church. Mr. W. J. Hodson, architect, The Avenue, Camberley.

PRICE LIST ON APPLICATION.

"BRIGHTSIDE" IMPROVED "PATENT" CALORIFIER.

BARNSELY.—Jan. 23.—For alterations to business premises, George Yard. Mr. Ernest W. Dyson, architect and surveyor, 10 Regent Street, Barnsley.

BEXLEY.—Jan. 22.—For the construction of a retaining wall 60 feet in length, average height 5 feet. Dr. Searle, Bexley.

BOOTLE.—Jan. 28.—For the construction of public convenience on the south-east side of the canal, Stanley Road. The Borough Engineer, Town Hall, Bootle, Lancs.

BRIGHTON.—Jan. 21.—For alterations and additions to the Hanover Terrace Council schools. Deposit 3/4. Messrs. T. Simpson & Son, surveyors, 17 Ship Street, Brighton.

BRISTOL.—Jan. 24.—For alterations and additions to the workshop at the day industrial school, Temple Backs. Deposit 1/4 1s. Mr. Peter Addie, Council House, Bristol.

BURNLEY.—Jan. 22.—For the construction of a goods shed and extension of offices at Burnley (Bank Top), for the Lancashire and Yorkshire Railway Co. The Engineer's Office, Hunt's Bank, Manchester.

BURY.—Jan. 22.—For brickwork for the walls, arches, chimneys and foundations for six through beds of retorts at the gasworks, for the Corporation. Mr. H. Simmonds, engineer and general manager, Gasworks, Bury, Lancs.

BURY.—Feb. 2.—For the joiners' work and painting required in connection with the museum at the art gallery. The Borough Engineer, Bury, Lancs.

BURY.—Feb. 2.—For the erection of the extension to the central tramway depot in Rochdale Road. Deposit 2/4. Mr. Arthur W. Bradley, A.M.I.C.E., borough engineer and surveyor, Bury, Lancs.

CARLTON.—Jan. 31.—For the erection of a temporary timber bridge over the river Aire at Carlton, within the rural district of Skipton. Deposit 1/4. Mr. F. G. Carpenter, West Riding surveyor, County Hall, Wakefield.

CLANDON.—Feb. 4.—For the erection of a smallpox hospital about two miles from Clendon station, Surrey, on the London and South-Western Railway. Deposit 5/4 5s. Send names to Mr. T. W. Weeding, clerk to the Surrey Smallpox hospital committee, County Hall, Kingston-upon-Thames.

CONSETT.—Jan. 23.—For the erection and completion of two houses at Castleside. Mr. Thos. H. Murray, architect and surveyor, Consett, Durham.

CUTSYKE.—Feb. 1.—For the erection of a signal cabin at Cutsyke, near Castleford, for the North-Eastern Railway Company. Mr. W. J. Cudworth, company's engineer, York.

CUTSYKE.—Feb. 1.—For the erection and construction of a new bridge over the Leeds and Pontefract Road at Cutsyke, near Castleford. The work comprises a steel bridge, with abutments of concrete, brick and stone, the abutments being for double line and the superstructure for single line of railway. Mr. W. J. Cudworth, the North-Eastern Railway Company's engineer at York.

EDINBURGH.—Jan. 19.—For the mason and bricklayer, carpenter and joiner, plumber, slater and plasterer and cement works in connection with the double cottage, &c., at Alnwick Hill. Mr. Edward C. Carse, architect, 37 Frederick Street, Edinburgh.

ELGIN.—Jan. 25.—For the mason, carpenter, slater, plasterer, plumber, painter and glazier's work, and laying-out and enclosing grounds of joint smallpox, &c., hospital, near Elgin. Mr. Charles C. Doig, architect, Elgin.

ELTHAM.—Jan. 22.—For the erection of a refreshment house at Avery Hill, for the London County Council. Mr. G. L. Gomme, clerk, Spring Gardens, S.W.

FERRYHILL AND WITTON PARK.—Jan. 19.—For the erection of new lock-ups at Ferryhill and Witton Park, Durham. Mr. William Crozier, A.M.I.C.E., County Surveyor's Office, Shire Hall, Durham.

GOSPORT.—Jan. 19.—For the work of alterations at the Gosport police station. Deposit 1/4 1s. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

GRIMSBY.—For the erection of a villa in Humberstone Avenue. Mr. J. J. Cresswell, architect, 77 Victoria Street, Grimsby.

GUILDFORD.—Feb. 2.—For carrying-out additions, alterations and reparations to the old school buildings at the workhouse. Mr. Edward L. Lunn, architect, 36 High Street, Guildford.

STONE IN LONDON.

THE damaging effects of the London climate on some of our stones has for some time past become more and more noticeable, and buildings erected only about ten years ago are showing grave signs of decay. Among such buildings are the premises of Lloyds Bank, West Kensington branch, erected about twelve years ago in red brick with stone dressings. All the scrolls, copings and finials on the gables, and large portions of the sills and string-courses were found to be decayed, and the stonework throughout was rapidly disintegrating. It was decided to adopt the Farnham process of waterproofing by indurating the fabric with paraffin wax, thus stopping further decay by rendering the too porous stonework impenetrable to moisture; and this work has now been carried out, the decayed stone having been first cut out and replaced with new stone, which was, of course, thoroughly waterproofed by the same process. The brick also was waterproofed and the whole surface cleaned by sand blast, so that the building is now entirely restored and renovated and future disintegration rendered impossible. This treatment must be of the greatest interest to all who own London buildings in which the stone is wearing, and as "prevention is better than cure" it is naturally desirable that the waterproofing should be done before the stonework has begun to disintegrate, as thereby the expense of replacing the decayed stone is entirely saved. The work described above has been carried out by the patentees, Messrs. Farnham, Ltd., Caxton House, Westminster, S.W.

TENDERS.

BLACKWOOD.

For the erection of twelve houses at Woodfield, for the Penmaen Building Club. Mr. W. A. GRIFFITHS, architect, Pontllanfraith, Mon.

TRADE NOTES.

A LARGE new clock is to be erected in Stowe Church, Staffordshire, from a legacy lately left for the purpose by a parishioner, and the executors have placed the order for the new clock with Messrs. John Smith & Sons, Midland Clock Works, Derby.

MESSRS. WM. POTTS & SONS, LTD., clock manufacturers, of Leeds and Newcastle-upon-Tyne, have received instructions to erect a new clock at the parish church, Middlesmoor, Pateley, Yorkshire, to the memory of the late Mr. Harker, J.P., Pateley, formerly M.P. for the Ripon Division, Yorks; also a new church clock for Carnaby, near Bridlington, East Yorks, and a large illuminated striking clock and bell for Liverpool, all from Lord Grimthorpe's designs and plans.

LITHONITE is the appropriate title for a covering which Messrs. Engert & Rolfe, Ltd., have introduced. It is a sheet asphalt, and the system consists of alternate layers of lithonite sheet asphalt and lithonite mastic, forming a homogeneous and durable mass, with a hard surface impervious to all weathers. From its hardness a flat roof covered with the material can be used as a garden or recreation ground. The use of it is not confined to flat surfaces, for it can be applied with advantage to Mansard and other roofs. It is light, indestructible, incombustible and cheap.

WE have again to acknowledge the receipt of a number of calendars. Many of them seem to be money wasted, owing to the fact of bad printing and bad design. Messrs. Duthie, of Glasgow, send us a calendar advertising Duresco, showing a somewhat striking design of the application of this material. We have also to acknowledge Messrs. Peckett & Sons' calendar, a useful, serviceable and unobtrusive calendar for the office. The Chloride Electrical Co. forwarded us a matchbox last week. No doubt many an architect and contractor will find this of service.

BUILDING AND BUILDERS.

For the new schools at Bexhill, which are of an exceptional character, Mr. T. A. Harris, sanitary engineer, of the Penix Sanitary Works, S.E., has supplied his "Premier"atories, special children's closets (pedestal type), galvaised flushing cisterns, drinking fountains, slop sinks and urinal flushing apparatus.

It was originally intended to name the new concert hall now being built in Great Portland Street, London, W., as a successor to the demolished St. James's Hall—St. Paul's Hall, as the new building succeeds St. Paul's Church, an edifice built some centuries ago. It transpired, however, that this title was unpopular with the general public. The managers, in deference to a public wish, decided to adopt the name of St. James's Hall.

The Levenshulme Council have agreed to urge upon the Local Government Board the urgent necessity for increased power being given to smaller townships to make improved laws as to housing, especially in relation to compelling builders to make a provision of a minimum size in the superficial area of one living-room and one bedroom in cottages to be erected. The Stretford Urban District Council has approved of the action of the Levenshulme Council, and also has instructed the Stretford representatives on the executive committee of the Lancashire Urban District Councils Association to ask that Association to take action for the furtherance of legislation on the matter.

The Salford Royal Hospital is to be enlarged to the extent of sixty-five beds, bringing the total up to 200, and by

the addition of a nurses' home. The extension committee have before them eight competitive architects' designs, from which a final choice will probably be made. Mr. Keith D. Young was recommended to the board of management by the President of the Royal Institute of British Architects as assessor. The proposed enlargement of the hospital will involve a large expenditure of money, and the committee of management hope that the public will make a liberal response to the appeal for the necessary funds.

ARCHBISHOP BOURNE, in a letter on the needs of the Roman Catholic elementary schools of the diocese of Westminster, points out that a committee of the Diocesan Association of Voluntary Schools had reported that the sum of 100,000*l.* was required at once to prevent the closing of several of their schools, and to build new ones to replace those that have been or were about to be closed in accordance with the requirements of the local authorities. Dr. Bourne appeals to all interested in the maintenance of the schools to make a determined effort to meet the actual and pressing need.

"The Manchester Tenants, Ltd.," have issued a prospectus. The declared objects of the Society are "to promote the co-operative ownership and public-spirited administration of suitable building estates in the Manchester district. To harmonise the true interests of tenant and investor by an equitable allocation of the profit arising from the careful use of the property, and from the increase of values, while avoiding the dangers and objections that too frequently accompany the individual ownership of houses." The Society has secured the option of purchase of the estate, which is within easy distance of the trams in Stockport Road and Wilmslow Road, the two Levenshulme stations and the proposed Ladybarn station on the new Wilmslow line. It is proposed to raise the share capital of 20,000*l.* in shares of 10*l.* each, with 5 per cent. interest out of profits. It is intended to plan the estate upon the latest hygienic principles. Each road is to have its own characteristic, and with an open space for recreative purposes. A plot of about 400 square yards per house would be allowed, inclusive of streetage. After allowing this the Society expects to erect about 100 houses. Rents are to be based at about 6½ per cent. on cost, plus rates and inside repairs.

VARIETIES.

THE directors of the National Provident Institution have elected the Right Hon. Ailwyn Edward Fellowes, P.C., a director of the Institution, to fill the vacancy caused by the resignation of the Right Hon. Augustine Birrell, K.C., M.P.

THE Dumbarton Town Council have passed a motion that three additional sand filters be provided at the water-works having a capacity of 638,600 gallons, and at a cost of 2,800*l*. It was also agreed that if the services of an engineer be required, Mr. John T. Baptie, C.E., Glasgow, be consulted.

MR. W. H. HUNTER, engineer to the Manchester Ship Canal Company, has deposited at the Private Bill Office of Parliament a statement of the expenses to be incurred under the new Bill of the Ship Canal Company, by which they seek powers to construct two piers or jetties. The estimate for one is 38,325*l*., and the other is expected to cost 69,035*l*., making the total 107,360*l*.

MR. F. H. TULLOCH held a public inquiry at the Benn Buildings, Rugby, last week respecting the application of the Rugby Urban District Council for powers to borrow 14,300*l*. for the construction of works for sewage disposal in the parishes of Bilton and Newbold-on-Avon. There was a large attendance, and strenuous opposition to the scheme was offered by Newbold Parish Council.

A PUBLIC meeting of Southend ratepayers formally approved the proposed Bill for the enlargement of the sewerage system. The Corporation proposes to provide a system for 100,000 inhabitants at a cost of nearly 150,000*l*. There were objections to the scheme on the ground that the sewage was discharged into the sea in almost its crude state.

THE Birmingham City Council on Tuesday adopted the scheme of the housing committee to lease land at Bordesley Green to a workmen's benefit society for the erection of workmen's cottages on the lines of a garden city. The Corporation is to undertake the cost of the road-making, the sewerage and the laying out of open spaces, the society allowing tenants to purchase houses on payments little higher than the ordinary rental. The proposal met with strong objection, on the ground that the Corporation was

giving up its interest in the improving value of the land and that it would be a financial loss to the city.

DUNBAR TOWN Council have received intimation that the termination of the sea erosion inquiry in England and Commission will hold an inquiry in Scotland, and will among other seaports, deal with the serious encroachment on the land in the vicinity of Dunbar. In response to invitation, the Town Council have consented to give evidence when the Commission sits. Notice has also been given that no grant is available towards assisting in the of a sea wall which the Town Council propose to erect on the shore at St. Anns, where the encroachment has been serious.

A MEETING of the joint board of the Parliamentary committee of the Trade Union Congress, General Federation of Trade Unions and the Labour Party was held last week in London, when the following resolution was passed:—"The meeting of the joint board, having heard the deputations representing a conference of labourers' unions, records its agreement with the expressed desire as to the necessity of limiting the number of unions having similar objects amongst general labourers; it agrees to recommend to the three national organisations not to affiliate any new societies until inquiries have been made from all these affiliated general labourers' unions as to the necessity for any such new union." The further consideration of the matter was adjourned till Parliament meets.

A CONFERENCE to consider a scheme for the development of the harbour at Arklow was held last week in that town. The Department of Agriculture, the Local Harbour Board and Messrs. Kynochs being represented. It was said that if the harbour were placed in such a position as would permit of the extension of their business, Messrs. Kynochs would lay out a considerable sum of money in extending their works in Arklow. They were also prepared to undertake works that would cost a sum of 20,000*l*. almost at once, and would furthermore undertake special harbour works for their own accommodation. It was decided to sign an agreement whereby the Department, if the Government gave them the grant of 10,000*l*. which has been allocated to Arklow, would carry out the scheme laid before the conference, provided also that the Government gave their sanction to the proposal.

CASES FOR BINDING THE ARCHITECT

Price Two Shillings. Office—6-11 Imperial Buildings, Ludgate Circus, London, E.C.

THE London Corporation have recently been considering question of the fire insurance of the public and other buildings under their control. In 1899 they rearranged and reduced their fire insurance risk, obtaining considerable concessions from the insurance companies with regard to rates of insurance. The whole insurance was then equally divided among twenty-four insurance offices, some of which have since been amalgamated. The proposal now is to distribute the insurances among the same companies, the being reduced as amalgamations take place from time to time until the total number of companies represented is not less than twelve. The City lands committee suggests that there should be given discretionary powers to allocate the risk among the participating companies as they may deem expedient, and the Sun Fire Office to be the leading office on the risk.

THE Darlington education committee, in their last report, recommended day classes for engineering apprentices. They have been taking place for some time negotiations have been taking place with various employers of labour in connection with day classes for apprentices. The various railway companies in the country have from time to time adopted schemes for encouraging the attendance of promising apprentices at technical institutions, chiefly in the evenings. More lately selected few of the most capable have been given exceptional advantages. In August 1906 the North-Eastern Railway Company decided to allow 5 per cent. of their wages to apprentices in Darlington to attend the technical college during the daytime for five months in the year, paying the college and making no deduction from their wages meanwhile. The advantage to the college is that its staff and equipment can be made use of during the day. In the company's shops well-equipped young men should soon be available for special work, and speaking generally, a quota is being added to the national asset of skilled men.

At Stoke-on-Trent the agent of a titled property owner was summoned last week by the Town Council for the sum of £38 1s. 3d. for work done under the Public Health Act. The town clerk stated that in consequence of the condition of the outbuildings attached to four houses at Trent Vale an outbreak of typhoid fever had occurred, and the defendant, as agent for the owner of the property, was served with notice to make certain alterations. He failed to comply with the notice, and the Council carried out the

work for which they now sought payment. Counsel for the defendant pointed out that although four houses were in question it merely said house. This was, he said, a trifling objection, but lower down the blank in front of the word "days," where the time for making the improvement had to be specified, had not been filled in. He contended that the notice was invalid. The plaintiffs admitted that the notice was bad and that the omission of the time, through an oversight on the part of the sanitary inspector, was a technicality fatal to the summons. The case was dismissed, but it was stated that the defendant having fought the case on principle was prepared to come to an arrangement with the Corporation.

THE Metropolitan Water Board have approved of the Metropolitan Water Board (Various Powers) Bill, to be introduced next session. The Bill has been prepared to give effect to the following resolutions which have been passed by the Board:—That application should be made in the next session of Parliament for general powers—(1) All the powers given to local authorities under the Public Health Act, 1875, with respect to the laying of pipes; (2) power to call upon other bodies to alter the position of any pipes, wires, drains, &c., similar to the powers conferred under the General Electric Lighting Acts, 1882 and 1888, giving power to the electric-lighting authorities for the alteration of any pipes of the Water Board; (3) the adoption of a uniform form of notice of intention to open streets somewhat similar to that scheduled to the East London Act, 1886, for use throughout the whole area; (4) powers to prevent persons from tampering with sluice valves and other apparatus on service mains, and thus shutting off the water. That application should be made in the next Session of Parliament for powers for the following purposes:—(1) Construction of a main from the Rammey Marsh well; (2) construction of a tunnel under the Thames at Twickenham; (3) acquisition of certain land and easements along the line of the proposed 30-inch main from Hampton to Hanwell; (4) acquisition of certain land along the line of the proposed new main from Ditton to Norwood to be the subject of a further report to the Board; (5) extension of time for the construction of works authorised by the Southwark and Vauxhall Water Company's Act, 1898, and by the Lambeth Waterworks Act, 1900.

ROMAN ROADS.

It is well known that the Romans constructed with great solidity, and maintained with constant care, roads diverging from the capital to the extremities of the empire. The good condition of these was thought to be of such importance that the charge was only entrusted to persons of the highest dignity, and Augustus himself assumed the care of those in the neighbourhood of Rome. The expense of their construction was enormous, but they were built to last for ever, and to this day remain entire and level in many parts of the world, where they have not been exposed to destructive violence. They usually were raised some height above the ground which they traversed, and proceeded in as straight a line as possible, running over hill and valley with a sovereign contempt for all the principles of engineering. They consisted of three distinct layers of materials: the lowest, stones, mixed with cement (*statumen*); the middle, gravel or small stones (*rudera*), to prepare a level and unyielding surface to receive the upper and most important structure, which consisted of large masses accurately fitted together. The Romans depended for the solidity of their construction on the size of their blocks, which were irregularly shaped, although carefully and firmly fitted. These roads, especially in the neighbourhood of cities, had on both sides raised footways (*margines*), protected by curb-stones, which defined the extent of the central part (*agger*) for carriages. The latter was barrelled that no water might lie upon it.

NEW CATALOGUES.

As many of our readers are aware, the firm of Fred Braby & Co., Ltd., have ingeniously combined their price list with a monthly diary. In a small space there are tables which are often required, and every copy possesses a coupon insurance guarantee for 100/. But from their very convenient size it might not be supposed without examination how various are the articles which the firm can supply. From air bricks to zinc ridging, to take the first and last items in the index, there is a wide field. But there is scarcely anything in metals connected with building or

contractors' work which is not comprised in Messrs. Braby's stock. From iron roofs to nails, from window sashes to fire-buckets, all will be found in their vast emporium. How so vast a business can be carried on may surprise us until we find that at the principal works there is a series of special departments which enable customers to attain their end without loss of time.

A GREEK and even a Gothic architect would be amazed at the variety of mouldings found in the catalogue of H. Morell. Judging by the numbers they can be counted not in hundreds, but in thousands, for one pattern is marked as No. 5,872. The old architect's mouldings were no doubt in stone, and their contours were worked out with difficulty, while the mouldings in the catalogue are in wood. They are adapted not only for the framing of drawings, but for engravings, but for other purposes, such as cornices, astrigals, rails, beads, &c. Some are produced in various colours, others are gilded, while there are also examples of elaborate compo-ornament. The sections are full size, with a few exceptions. It may also be mentioned that an engraving is given of a new mitre-cutting machine, the use of which can be adjusted at any angle and is therefore serviceable in cutting exagonal and oxagonal frames. From his own experience of it, Mr. Morell considers it the most efficient tool on the market.

MESSRS. R. & A. MAIN, of Glasgow, who have gained a reputation in several classes of work, are also makers of various kinds of cooking and heating apparatus. The testimonies of their success in the last department are manifold. The fact that "Main" cookers are employed in the Royal kitchens and by Lyons & Co. will by many judges be considered as outweighing the gold medals received by the company at various international exhibitions. There is an apparatus described in their catalogue adapted to the use of steam, coal and gas. Judging by the illustrations, ranging from steamers, grilles, &c., are all of the kind which can sustain the rough usage of the assistants to cooks, who have the weakness for making a noise with metalwork.

FOUNTAIN PENS.

have received from the London Pen Company, Ltd., of 101, Old Street, W.C., a specimen of their guarantee fountain pen," so termed by reason of the important fact that it carries a guarantee certificate for a period extending two years, while the indications are that it is practically everlasting, for the materials are evidently of the quality, and a notable feature is the simplicity of construction, so that satisfaction is insured in all respects. The same company's stylographic pens, of which a specimen has also been submitted to us, are equally perfect in construction, and form a valuable complement to the equipment of all who have much writing to do under circumstances of a varying character.

In this connection it is interesting to note that Mr. C. W. Benson, the patentee and founder of the London Pen Company, Ltd., who came over to this country from America in 1879, and whose lamentable death recently occurred, was recognised as the father of the fountain pen trade and the leading authority on the subject, with which he was bound during a long life, while the numerous patents that issued from his inventive and mechanical genius would practically constitute a history of the useful article in question.

ENGLISH STEEL-FRAMED BUILDINGS.

Messrs. E. F. Blakeley & Co., Vauxhall Ironworks, Liverpool, have been very busy throughout the year in the construction of steel buildings, roof principals, churches, &c. The completion of the new steel framework and fireproof building for Messrs. G. H. Lee & Co., Basnett Street (Messrs. Pearson & Simon, architects) is an important addition to the architectural buildings of Liverpool. Important steelwork extensions have been carried out for Messrs. Lever Bros., Ltd., Port Sunlight (Messrs. Wm. & Segar Owen, architects), the Wolverhampton Corrugated Iron Co., Ltd., at Ellesmere Port, and other prominent manufacturers throughout the country; also electric car sheds at Swinton for the Lancashire United Tramways, Ltd. (Messrs. Matear & Simon, architects); steelwork for the new grand stand

for the Liverpool Football Club (Mr. Archibald Leitch, architect, Glasgow and London), and churches at Birmingham (for the Prison Commissioners), Horwich, Blackley, Wallasey, &c. Messrs. Blakeley & Co. have supplied a very large number of steel roof principals for various corporations

and works, and exported on behalf of British houses a large number of iron buildings, wharves, piers, stores, bungalows, &c. The illustration shows Messrs. Geo. H. Lee & Co.'s extension.

CORRESPONDENCE.

How to Fight Socialistic Legislation.

SIR,—The short interval between the late autumn session and the coming session of 1907 barely gives us breathing time before we are again flooded with vote-hunting measures contemplated no doubt by the Government, plus the private members' bills that will be supported or taken up by the Government. Knowing, then, as we do from past experience the trend of the policy of this and, indeed, of all Governments since 1870, it would be well to inquire how far the administration of the day fulfils the object and duties of Government. To what

end do we pay our Secretaries of State 5,000l. a year? Is it to enslave us with inspectors and inspectresses and hamper industry by restrictions on trade and labour, plus interference with contract, and the transfer of property and property rights from the less numerous to the more numerous voting classes of the nation? Or is it, as I have heard in bygone years a Liberal Attorney-General declare it to be, the primary duty of Government to maintain and secure our liberty and property of all kinds, including a Briton's free right—using Lord Bramwell's famous words—"to bestow his labour and his talents as seems to him best," a right practically taken away by the Trade Disputes Act of last session? That Act now allows picketing that need not be peaceful, and which can only be met, in the interests of the liberty of labour and trade, by the counter-picketing of pickets—a course for which an efficient organisation already exists.

Well, such being the primary duty of Government, it is needless, looking to the Socialistic vote-hunting measures that have been passed, and not resisted by the so-called Opposition, both parties striving to retain or gain the support of the Socialist Labour Party, whose avowed object is the doing away with individual liberty and the absorption of property of all kinds into the hands of a labour-governed State—it is, as said, needless to inquire how far the two main parties in the State, when holding the reins of power, have fulfilled that duty. Their measures and actions give a clear and definite answer.

Where, then, is there a remedy for this state of things to be found? To whom can we look? The Duke of Devonshire will not, I fear, move. Lord Rosebery seems inclined to remain in his lonely furrow, from which the Scots Greys alone have been able momentarily to move him. Whither shall we turn? To whom shall we appeal? Why, to all true Britons who love liberty, who are in favour of private as against State-owned property, and who are prepared to stand by individualism with its endless chances of success in life, and resist the coming of the dead level of Socialism so repugnant to the feelings of free men. Yes, let all such band themselves together irrespective of party, and strive by their votes to give effect to principles which all Governments know to be sound, but have not the courage to support. Meetings should be held alike in country and

in town, and anti-Socialist defence associations formed will steadily resist all Socialistic measures no matter what they come.—Yours faithfully,
WEMYS
Gosford, Longniddry, N.B. : January 15, 1907.

NOVELTY IN ROAD-MAKING.

At a meeting on Monday of the members of the Midland Association of Local Government Officers, Mr. G. H. the surveyor of Aston Manor, said most things with which we were acquainted had undergone changes of a revolutionary character during the past century. But that was not so with the art of road-making. He was, indeed, inclined to say that the roads made 1,800 years ago were more serviceable and more scientifically constructed than they were to-day. In the history of the British Isles there appeared to have been two periods of road construction: the first in the reign of Claudius Cæsar, Emperor of Rome in the year 43, and the second in the year 1811 by Mr. McAdam. Of the two systems the latter had been more universally adopted, but in his opinion the former was more preferable. All that was useful and scientific in McAdam's system was to be found in Roman construction. It would therefore appear that although the world had been revolutionised more than once during the last eight centuries, the art of road-making had been little more than stationary. After the Romans left the country in 406 A.D. next to nothing was done to maintain the roads in a proper state of repair. Later on they were absolutely neglected and gradually fell into disuse, and it was not until that time on until the beginning of the nineteenth century the roads of the country went from bad to worse. In regard to modern roads he was of opinion that there was not half enough steam-rolling done. Given a good hard and dry foundation, with equally good broken stone and with skilful steam-rolling, a far better road could be made than by any admixture of binding material. Our main thoroughfares were to remain under macadam. A great deal more money would have to be expended on maintenance than hitherto. Many would have to be entirely reconstructed in order to provide the necessary foundations. Having regard to that possible heavy

THE "DRAWWELL" GRATE

WAS PLACED

First in the Final Test

at the recent test with Firegrates at the New Government Offices in Whitehall, under the direction of a sub-committee of the Coal Smoke Abatement Society, in conjunction with Sir Henry Tanner and a committee of experts, for smoke abatement, heating power, fuel economy, and suitability for public and private buildings.

N.B.—All Grates bear the Trade Mark and Name "Drawwell" on firebrick to insure against imitation.

This Grate can only be supplied through Builders' Merchants, Ironmongers, &c., but Drawings and Particulars can be obtained from

W. B. CLARKE, Agent, where the "Drawwell" can be seen in action.

expense, the heavier cost of reconstruction and the relatively short life of the best macadamised road, it not be altogether out of the question to suggest that ad of the future would be a reversion in all the ial particulars to the Roman roads of Claudius. That say, a hard coherent scientifically-formed foundation, d by a water-tight pavement. Such a road would he demands of all sorts and kinds of traffic. It would e comparatively dustless and mudless, and easily cleansed ept in repair. The foundation once properly con- d would last as long as the Roman foundations, and eface would have a minimum life of twenty years. It e kept in repair at a fraction of the cost of the best amised road. The initial expenditure would, of e, be very great. But as the resources of Great a surpassed those of the Roman Empire, should the on of expense be a fatal objection to it?

"GROGS" IN CANADIAN BRICKMAKING.*

chosen as the subject of this paper one which I think of great interest and also of great importance to clay- rs. By "grog" is meant those substances which e ded to strong clays to render them milder and more worked. As a rule only one such substance is used ckmakers in this country, and that is sand; but a few e can be used in case sand is scarce, e.g. loam, pow- brick-bats, sawdust, coal screenings, &c. Of course e several grogs have different effects upon the brick or e product to which they have been added, and I wish to e briefly a few of the effects of these grogs on our e in Ontario.

ere is a common error among builders and contractors e general concerning the addition of grogs. They believe e addition of sand or powdered brick to a clay is an e tuation and a detriment to its use as a building e rial, much as we view the addition of cotton or shoddy e woollen fabric. This error on the part of brick users, e many brickmakers also, is a serious one, for the addi-

A lecture delivered by Professor Baker, of the School of e ing, before the Association of Canadian Clay Products Manu- e ctors, and published in the *Canadian Architect*.

tion of these grogs is just the reverse of the above. They improve the brick in several ways, as I hope to show you.

Looking at this subject first from the standpoint of the brickmaker, you all know well the difficulties that have to be met in working a clay that is too strong or fat, as it is often called. In the first place, such clay is difficult to mine or dig; it sticks to the ploughs, spades, scrapers or whatever else may be used to dig it. It sticks together so that it can scarcely be picked apart. You all know just how tough a clay bank can be. If, however, there be a certain amount of sand in the clay it digs so much more easily.

The tempering of a strong, stiff clay is a most difficult thing; it is almost impossible to do it by hand, and if it is done by a pug-mill or other machines the tough clay will prove a great user of power. About the only way to temper and disintegrate such clay is to dig it in the fall and allow it to lie in a heap over winter, when with frost and wet and dry it will slowly slake and break up to a workable condition. But some of you have not time for this, and should add sand to such clay in your pug-mill, or tempering pit, or to the brick machine itself, if you do not temper in a separate machine.

In the next part of brickmaking, viz. moulding, sand plays a very important part. It is almost impossible to shift a strong clay from the moulds; such clay will fit the mould so tightly, and it will be so close in grain that it will rub the moulding sand off the moulds and make it almost impossible to shift the brick when made. It is astonishing what an improvement a little sand will make to such a clay in this respect.

In drying either stiff mud or stock brick an addition of sand will make an enormous difference in the rate. Very strong clay will crack and slake or a dry shell will form, keeping the interior of the brick wet, or the brick will warp and shrink out of shape by unequal drying and the accompanying air shrinkage. When sand is added it renders the clay leaner or milder; it will not require so much water for moulding, and the grains of sand keep the brick more open, so that the moisture can escape in drying. Again, the sand will not shrink, so that the bricks will keep their shape much better, as only part of the material of which they are made shrinks.

We have seen from the above remarks, certain parts of

which must describe conditions which all of you have experienced in one respect or other of your industry, that the addition of sand makes clay working much easier in every respect, from the digging of the clay to the burning of the finished product.

But all that we have said is from the standpoint of the brickmaker; but what of the brick user? Does the addition of this sand mean a poorer article for builder and contractor? This is the other standpoint from which I wish you to study this question.

Two great classes of strains are put upon brick in building; the one is a tensile strain which would tend to pull bricks apart, the other is a pressure which would tend to crush the brick. The second of these is most important, as it is practically the stress to which bricks are subjected in a building by the weight placed on them. In order to submit clays to some of these tests, I took several of our Ontario clays and subjected them to these tests, as follows:—

Table of Clay Tests.

Sample.	15 per cent. Sand.			25 per cent. Sand.			33 per cent. Sand.		
	No. 1.	No. 2.	Aver.	No. 1.	No. 2.	Aver.	No. 1.	No. 2.	Aver.
A . .	250	210	230	320	365	342	250	265	257
B . .	290	325	307	380	350	365	270	290	280
C . .	300	340	320	350	375	362	326	300	313
D . .	210	185	197	330	350	340	280	295	287
E . .	235	270	252	295	310	302	200	230	215
	261			342			270		

The raw clay with its own 15 per cent. of sand was formed into a briquette, then the percentage of sand was increased to 25 and then again to 33 per cent. These briquettes were made about the shape of the figure 8, the narrow part being 1 inch wide and the whole briquette is 1 inch thick, so that at the smallest section, that is, at the place where they will naturally break, the cross section would be 1 square inch. The weight applied was in pounds, so that the results were in lbs. per square inch. The briquettes were all burned in the same muffle furnace, so that all three sets of briquettes were subjected to the same conditions in burning.

From the above tests we see that the addition of sand to these clays makes them stronger and better able to resist the pulling strains to which they are subjected. We

see here that the best results were obtained when the cent. of sand is 25, whereas 33 per cent. is a little too much. This, of course, simply means that you can get too much even of a good thing, and of course there is a possibility of increase of sand, which, seriously overstepped, becomes a detriment instead of the reverse.

The crushing test, or the ability to withstand weight placed upon it, is still more important to brick users than some tests of these are also of interest. In these tests small cubes were made 1 inch to an edge, so that the cubes were 1 cubic inch and any face was 1 square inch. Pressure was then placed on this, and gradually increased until the cube crushed. Four tests were made on ordinary red brick, as sold in general for building, and these required an average of 2,460 lbs. to the square inch to crush the brick. This figure is given as a standard for ordinary stock brick and for comparison with the tests given below.

Table of Clay Results.

Sample.	15 per cent. Sand.			25 per cent. Sand.			33 per cent. Sand.		
	No. 1.	No. 2.	Aver.	No. 1.	No. 2.	Aver.	No. 1.	No. 2.	Aver.
A .	3150	2820	2985	3190	3390	3290	2640	3060	2850
B .	2900	2580	2790	2990	3375	3182	3400	2760	3080
C .	2620	2760	2690	3250	3580	3415	3615	2880	3247
D .	3480	2844	3162	3640	4370	4005	2510	2640	2575
E .	3710	3410	3560	4360	4720	4540	3390	3570	3480
	3027			3686					

Here again we see that the addition of sand improves these products. The small blocks were all burned in one kiln at one time, so that the conditions were uniform for all. The tests show that 25 per cent. of sand is the best, while 33 per cent. oversteps the limit and the ability to withstand pressure begins to drop again. You will notice also that the average of tests made on the clays having 15 per cent. of sand in them, and this, by the way, is the average of our Ontario clays, is about the same as the standard of four tests made on ordinary stock brick as sold in general for building purposes, which shows that the tests were about as fair as could be made. We realize, of course, that many tests must be made before any general statements can be made, but it seems sufficiently established when an average of ten tests on a clay having 15 per cent. sand in it gives 3,027 lbs. to the square

ordinary stock brick of commerce made from such also gives 2,460 lbs., and that ten tests of clay with the content increased to 25 per cent. gives an average of 5 lbs. per square inch, that the addition of sand to clay is a desirable thing. It seems certain, at any rate, that the addition of 25 per cent. of sand, or one shovel of sand to three shovels of clay, is a decided improvement on strong brick, but this per cent. of sand should not be seriously stepped or the values drop again.

Do not mistake me to mean that every one of you should add 25 per cent. to your clay in working; some of you have already clay already, and no doubt you know it and are satisfied with the way it works into brick. But others, and the majority at that, have a strong clay difficult to handle and to work up—do not hesitate to use sand. It will not hurt the strength of your brick unless there be limestone in it, and this is very rarely the case.

If you suspect limestone in your sand, put a little of it in a glass tumbler or a bottle, then pour in a little acid of any kind, and warm it slightly by placing it in a little warm water. If there is any limestone in your sand you will see effervescence or bubbling coming off the sand. If your clay burns to white brick or buff brick, this will not hurt them, but if your clay burns to red brick, avoid any sand or loam that shows limestone, for this will tend to the colour of the brick by making them light in colour, and they will be spotted.

The addition of combustible grogs, *e.g.* sawdust or coal screenings, is for a different purpose entirely, and this is a subject which has not been considered very much in this country. In Europe such grogs have been used to a considerable extent. Coal, *e.g.* is powdered and mixed in the clay; when the kilns are burned this fine coal dust is also used and helps to distribute the heat throughout the brick and aids in the burning. The particles of clay fuse together and knit to each other, and a more or less porous brick results.

Considerable use is now made of coarser materials as grogs, *e.g.* coarser coal or sawdust is commonly used. This is used in the manufacture of porous bricks, terra-cotta bricks, and fireproofing.

The aim of the architect and contractor now is to erect buildings that will be fireproof and yet not too heavy.

This is now accomplished by making the main structure or shape with iron and filling in with terra-cotta lumber or fireproofing. To make this we may use any kind of clay, as the colour of the product does not signify, provided it is strong and light. The clay is pugged thoroughly with coarse sawdust, the blocks of any desired shape are made, as in the stiff mud process, by varying the die; they are dried like tile, after which they are burned in a down-draft kiln. The sawdust soon catches fire and helps to burn the blocks, and after burning out the small pores are left, making the blocks quite porous or vesicular, so much so that the blocks are very light and can be used for ceilings, arches, domes, roofs, partitions, &c., or for any of the purposes to which heavier timber would be used. These blocks are so porous that nails, screws, spikes, &c., can be driven into them with about as great ease as into timber. The rough porous blocks serve admirably to plaster on to, so that a building of any shape may be covered by them and plastered over and painted. For this reason most of the interior decoration now seen in large buildings is accomplished in this way.

The discussion of grogs so far has been confined to different substances that are added to the raw material. There is one new use for grogs now which may not be well known to you all. All of you who are working with the ordinary scoved kiln or Dutch clamp kiln have experienced the difficulty of burning the brick right to the outside of the kiln. This has been aided in many ways, *e.g.* by leaving the heads more open in piling, to cause more draft in that part; or again, the centre of the kiln may be covered on top by mud, or by asbestos sheets, thereby throwing the draft to the outside around the edges. But a new and much better method may now be used. This consists in placing a row of hard coal screenings, which are cheap, around the edge of the kiln on top. The ridge of hard coal is about 18 inches wide and rounded up like a potato ridge. In setting the kiln the heads are left open as usual, and a row of skintlers are usually placed on the very outside row. After the kiln has burned up considerably in the usual way, and when the heat begins to get up through the heads, the kiln man goes up on top, and by the use of a small wedge like a poker he works the brick a little and allows

a little of the coal to trickle down into the kiln. This coal takes fire and helps to burn the brick, and at the same time creates an extra draft through the heads, which soon draws more of the kiln fire to those parts. This act should be repeated every hour, letting only a little of the coal trickle down each time, so as not to choke the drafts or cause too much fire in the heads. By this process your kilns can be burned right to the scoving. I have seen them done, and good red face brick shipped from against the scoving. In down-draft kilns, of course, the fire can be drawn to any part of the kiln by the use of dampers.

I have confined all my remarks to this one division of clay manufacture, because I am convinced that it is a most important matter to you all, and I am sure it is one that has not received its share of consideration on your part. These are not experiments; they are points that are in use by successful clay-workers, and I hope I have been able to arouse your interest in this great department of your work.

PROGRESS IN MEXICO.

THE British Consul at Mexico city (Mr. L. J. Jerome) calls attention, in his recent report, to the gradual introduction into Mexico of a higher standard of living among all classes, particularly among the working classes in the cities and towns. Hitherto the vast majority of the population have been regarded as a negligible quantity—in fact, as regards all articles imported into the country, as non-consumers. The change pointed out greatly extends the Mexican market, not only for those commodities of first necessity, but for many things which might well be classed almost as luxuries, and yet are being sought for by sections of the community who until recently had either no wants, or at most such as could be very easily satisfied.

Among other developments pointed out by Mr. Jerome are the extension of hydro-electric power for light, traction, industrial and irrigation purposes, and renewed activity in railway construction. He adds:—"I believe that if properly looked after there would be a good demand for hardwood sleepers for railways. The possibilities of Mexico as a market for boilers, engines and machinery seem to be entirely overlooked. In April, May, June and July of 1905

I visited many of the provincial towns and inspected a number of factories of all kinds, and I must confess to considerable disappointment in finding the small proportion of British-made machines, engines and boilers. I believe there will be an increased demand for these articles. I can too strongly point out that very few indeed have been cases where purchasers of these articles have not met obligations. The cases that I know of are so few that I would not mention them but for the fact that at home the idea seems to be prevalent that there is considerable selling machinery in Mexico."

As regards cement, the British Vice-Consul at Vera Cruz (Mr. L. J. Nunn) considers there is an opportunity for the British manufacturer to get a share in a trade that is steadily increasing, as, whilst it is true that the harbour works at Vera Cruz are now completed, still there are many public works of equal magnitude projected and at present in the course of being carried out which will involve an expenditure of millions of dollars, a great portion of which will be spent in cement. For instance, there is not a town of importance that has not in view the improvement of its drainage, waterworks, streets, pavements and similar projects, in all of which large quantities of cement will be required, and in Vera Cruz itself there is the work of building and equipping a joint railway terminal station. Last, but not least, is the ordinary demand from the public in general for small buildings.

Mr. Nunn further reports that a company has been formed to take in hand the construction of warehouses, extra wharfage and the other general improvements necessary to make Vera Cruz a first-class port. All that now remains to be done is to obtain the Government approval of the plans, which, once effected, there will be no further delay. As the company will be registered in London, Mr. Nunn says British manufacturers would do well to keep the movements of this new enterprise in view in order to make an effort to secure the large orders that will be placed for cranes (probably electrical), and general labour-saving devices, structural iron, steel and cement. The many buildings required, a full hotel equipment, a discharging plant, a dredger, a steam cutter and the like, or less general equipment incidental to the requirements of a dock company.

CABOT'S INSULATING AND SOUND-DEADENING QUILT

PREVENTS THE TRANSMISSION OF SOUND through walls and floors by absorbing and breaking up sound waves. No other Deafener does this.

KEEPS OUT HEAT OR COLD exactly as do the feathers of a bird; providing innumerable minute dead spaces, giving highest insulating power. Will save enough fuel in a single Winter to pay for itself. Keeps a room warm in Winter, cool in Summer. DECAY, MOTH, AND VERMIN PROOF, AND UNINFLAMMABLE.

Scientific investigation has proved that for HEAT INSULATION or SOUND-DEADENING the highest degree of efficiency, with economy in cost and extreme durability, has been attained by CABOT'S QUILT.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tender and other particulars of Works in progress in which they may be interested.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

CASTLEFORD.—March 3.—The Governors of Castleford Secondary schools invite designs from architects practising in the West Riding of Yorkshire for a dual Secondary school, &c., for 300 scholars. Premiums of 50l. and 25l. to be awarded by Mr. W. H. Brierly, the assessor. Deposit 10s. 6d. Mr. A. Wilson, clerk to the Governors, Station Road, Castleford.

DURHAM.—March 15.—The Durham County Education Authority invite competitive plans for a Secondary school at Bishop Auckland. Premiums of 20l. and 10l. will be paid for the plans placed second and third respectively. Mr. J. A. L. Robson, secretary for higher education, Shire Hall, Durham.

IRELAND.—Feb. 6.—The Galway Board of Guardians invite plans and estimates of a proposed fever hospital. The premium of 25l. will be merged in the architect's fees if the winner carries out the work. Particulars from Mr. R. F. Mullery, clerk to the Union, Galway.

SUNDERLAND.—Feb. 1.—The committee of the Sunderland infirmary invite designs for a children's hospital. Premiums of 100l., 50l. and 25l. are offered. Deposit 1l. 1s. Mr. Thomas Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland.

CONTRACTS OPEN.

AUSTWICK.—Jan. 28.—For the mason, slater, plasterer, joiner, plumber and glazier's work required in the erection of various buildings, comprising administration, isolation, laundry, discharge and mortuary blocks, scarlet-fever pavilion, stable and cart-shed, for their new isolation hospital at Ell Meadow, near Harden Bridge, Austwick, for the Settle Rural District Council. Mr. T. A. Foxcroft, surveyor, Town Hall, Settle.

BAGSHOT.—Jan. 28.—For the erection of schoolrooms, vestries, &c., for the Wesleyan church. Mr. W. J. Hodson, architect, The Avenue, Camberley.

LUXFER SASH CANOPY SKYLIGHT PAVEMENT PRISMS

Bring in Daylight.

Specialties:—Fire-resisting, Ornamental and Roof Glazings. Dome Lights, Ceiling Lights, Lantern Lights, Floor Lights, Stallboard Lights, &c., &c.

The British Luxfer Prism Synd., Ltd., 16 Hill St., Finsbury, E.C.

BARNSELY.—Jan. 28.—For the whole of the work (except plumbers and glaziers) required in erection and completion of new meter works off East Gate. Messrs. Crawshaw & Wilkinson, architects, 13 Regent Street, Barnsley.

BARROW-IN-FURNESS.—Feb. 4.—For the erection and completion of proposed witnesses' rooms at the police-court. The Borough Engineer, Town Hall.

BIRSTWITH.—Feb. 6.—For erecting three cottages at Birstwith, for the North-Eastern Railway Company. Mr. William Bell, the company's architect, York.

BLAYDON-ON-TYNE.—Feb. 6.—For erecting goods warehouse, &c., for the North-Eastern Railway Co. Mr. William Bell, the company's architect, Central Station, Newcastle-on-Tyne.

BOOTLE.—Jan. 28.—For the construction of public convenience on the south-east side of the canal, Stanley Road. The Borough Engineer, Town Hall, Bootle, Lancs.

BRADFORD.—Jan. 28.—For alterations at the receiving offices, Manor Row, for the Corporation. The City Architect, Whitaker Buildings, Brewery Street, Bradford.

BRADFORD.—Jan. 28.—For the erection of St. Joseph's College, Bradford. Mr. Edwd. Simpson, architect, 12 Cunliffe Terrace, Manningham.

BURNLEY.—Feb. 5.—For the erection of a county court at Burnley, for the Commissioners of H.M. Works and Public Buildings. Deposit 1*l.* 1*s.* H.M. Office of Works, Storey's Gate, S.W.

BURRINGTON.—Jan. 29.—For the erection of station buildings and a cottage at Burrington, Somerset, for the Great Western Railway Co. The Engineer at Bristol Station.

BURY ST. EDMUNDS.—Feb. 11.—For the erection of a covered grand stand to accommodate about 3,500 persons, and other work in connection therewith, for the Bury St. Edmunds pageant, July 8 to 13. Mr. Walter D. Harding, A.M.I.C.E., engineer, Town Hall, Bury St. Edmunds.

BURY.—Feb. 2.—For the joiners' work and painting required in connection with the museum at the art gallery. The Borough Engineer, Bury, Lancs.

BURY.—Feb. 2.—For the erection of the extension to the central tramway depôt in Rochdale Road. Deposit 2*l.*

Mr. Arthur W. Bradley, A.M.I.C.E., borough engineer and surveyor, Bury, Lancs.

CARLTON.—Jan. 31.—For the erection of a temporary timber bridge over the river Aire at Carlton, within the rural district of Skipton. Deposit 1*l.* Mr. F. G. Carpenter, West Riding surveyor, County Hall, Wakefield.

CATERHAM.—Feb. 6.—For remodelling the two general bath-rooms at Caterham asylum, Surrey. Deposit 1*l.* Mr. W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, Metropolitan Asylums Board Offices, Embankment, London, S.E.

CHATHAM.—Feb. 12.—For the erection of a laundry building and bakery on land adjoining the workhouse at Chatham. Deposit 1*l.* 1*s.* Mr. E. Farley Cobb, architect, 20 High Street, Rochester.

WORCESTER.—Jan. 31.—For an extension to the Victoria Institute. Deposit 2*l*. 2*s*. Names by Jan. 15 to Mr. A. G. Parker, quantity surveyor, 5 Foregate Street, Worcester.

MR. RAYMOND F. CRIST, writing from Johannesburg to the American Department of Commerce and Labour on the trade conditions at that centre, says:—Our goods will have to rely largely upon past reputation to bring future sales. . . . Every sentiment of loyalty to Great Britain as the mother country is appealed to, and in addition the colonial Governments set a pronounced example in support of these appeals by awarding contracts of every nature—especially large ones—wherever by so doing it is not too offensive, to British manufacturers. In all municipal work the rule is to give the contracts to the mother country. An instance was cited to me where a difference of 12,000*l*. in a contract had failed to throw it on to American bidders, the contract going to England on a bid of 53,000*l*. as against 41,000*l*. Engineers are often brought out from the mother country by the different colonies in special cases, and contracts drawn up by these engineers are awarded to their friends at home. This is only one of many ways in which these colonies are worked for the benefit of "home industries."

BIRMINGHAM TEACHING PARIS.

It was stated at the annual meeting of the Birmingham District Drainage Board on Tuesday that the works had been inspected by a French deputation which had toured Europe and America in search of a satisfactory system. In his report Dr. Calmettes, the head of the deputation, said:—"Until recently the city of Birmingham has been obliged to set aside large areas of land in the low-lying parts of the farm to act as downward intermittent filtration beds with or without cultivation, and this for want of sufficient irrigation area to deal with the total flow of sewage. Thanks to biological filters, this land can now be cultivated in an ordinary way under the best and most economical conditions. So that having for a considerable time practised land irrigation, which they have carried out in a thoroughly scientific manner on their estate, the city of Birmingham, convinced from the progress of their experience that the results of purification in biological filters are better both hygienically and economically, have considered it necessary to adopt this latter method, and to continue the land treatment only to the extent to which arable land is capable of dealing with the quantity of sewage supplied to it without injury to crops. This is exactly the solution which, sooner or later, we are convinced the city of Paris will be forced to adopt."

HIS MAJESTY'S Consul-General at San Francisco (Mr. C. W. Bennett, C.I.E.) reports, according to the *Board of Trade Journal*, that the different insurance companies have now practically completed the settlement of losses incurred in the recent disaster at San Francisco, and that the British companies have fully sustained the reputation that, by long dealing in the States and elsewhere, they have secured for fair settlement of claims. The gross amount paid is, so far as can be ascertained, about forty millions sterling, whilst the actual loss caused by the fire, without including loss of income, &c., from burned buildings, is estimated at from seventy to one hundred millions. Eliminating property not insured at all, there is no doubt, says Mr. Bennett, that property in San Francisco was very much under-insured.

BUILDING AND BUILDERS.

The buildings and improvement committee of the Lincoln City Council have passed plans for the erection of a theatre in Saltergate by a syndicate of local and other gentlemen. The theatre will hold 1,500 people, and, it is anticipated, will cost about 15,000/. The plans have been prepared by Mr. W. Hancock, architect, of Leicester.

The building and stores sub-committee of the Bath Education committee report that, with regard to water consumption, the report of the surveyor of corporate property showed that for the quarter ended December the quantity of water used in the schools was 439,000 gallons, as compared with 349,000 gallons for the corresponding period of the previous year. The figures for the respective twelve months were 1,746,000 and 1,935,000.

MESSRS. PATMAN & FOTHERINGHAM have obtained the following contracts:—(1) Messrs. Thomas Cook & Sons' (tourist agents) new premises, 107, 108 and 109 Fleet Street, E.C.; Messrs. Smee & Houchin, architects. (2) Buildings, &c., May's Yard, Eagle Street, Holborn, W.C., for Messrs. H. & G. May; Mr. Hewish, architect. (3) Premises for the Express Dairy Company, Ltd., Tavistock Place, W.C.; Mr. Fitzroy Doll, architect. (4) Library, Hither Green, for the Lewisham Borough Council. (5) Alterations to Messrs. Schweppe's offices, Hammersmith, W.; Mr. Epton, architect. (6) Two conveniences in Aldgate and Soreditch, for the City Corporation of London.

An inquest was held last week at Ilkley on F. Carter, forty-three, foreman bricklayer, and W. Mitchell, forty-five, iron, who were killed by the collapse of a scaffold on the town hall building, in course of erection. With two others

they were removing a stone, weighing 5 cwt., on a trolley over the scaffold, when it gave way, and three of the men fell into the roadway. The stone struck Carter on the body and legs and then fell across Mitchell's face. Both men died almost immediately. The jury, in returning a verdict of accidental death, recommended that the Parliamentary committee now sitting to inquire into building accidents be asked to consider the advisability of making regulations respecting the erection of scaffolding and the testing of scaffold-poles.

ELECTRIC NOTES.

It has been officially decided that 15,600 cubic feet of water may be diverted from the American side of the Niagara Falls and 160,000 horse-power may be imported from the Canadian side without substantially impairing the scenic grandeur.

The chief officer of the London County Council tramways has designed an additional safeguard for the trams in connection with brake mechanism. Already it has been tested on two cars, and appears likely to meet in a great degree the special object for which it is designed.

The Marylebone Borough Council have decided, on the recommendation of the electric-light committee, to allow large consumers of the borough's electricity carrying on business in Oxford Street, Baker Street and Edgware Road a discount of 25 per cent. off their electric-light accounts, provided such accounts are paid monthly and within ten days of the date of rendering.

The watch committee of Bolton having threatened to take proceedings if the Corporation continued to permit the overcrowding of tramcars, the matter has been referred to the tramway committee to consider and report. It was stated by one councillor that owing to the inability of conductors to collect fares the Corporation were losing 1,000/. a year. As many as a score of people could be seen hanging on to the footboards, and these weighted the cars down to such an extent that the lifeguard dragged on the ground.

The promotion of a Parliamentary bill for the electrification of the tramways in Rawtenstall and Bacup was agreed to at a statutory meeting of electors of Rawtenstall. The scheme contemplates the outlay of 113,668/., also 82,310/.

for equipment, 8,000*l.* for motor-buses, 5,500*l.* for land for municipal offices, 3,000*l.* for electrical motors and 5,800*l.* for sanitary purposes. The total is over 223,000*l.*, and the town clerk has made a statutory declaration of revenue to be derived from the expenditure, and puts it at 20,000*l.* a year.

THE Edinburgh Town Council have adopted the recommendations of the electric-lighting committee that the water in the sewer belonging to the Water of Leith Purification and Sewer Commissioners be adopted as the scheme for condensation at M'Donald Road Station at a probable cost of 6,000*l.*; that estimates be obtained for the following plant required at M'Donald Road Station:—Two turbo-generators, probable cost 15,000*l.*; condensing plant, switch-board, steam pipes, foundations, &c., probable cost 14,000*l.*; that application be made to the Secretary for Scotland for consent to the borrowing of a sum of 150,000*l.* for capital works, under the Electric Lighting Order of 1891.

THE Hamilton Town Council have sanctioned the proposal of the committee to ask the Secretary for Scotland for additional borrowing powers to the extent of 12,000*l.* in connection with the electric-lighting scheme for the burgh. The present borrowing powers have been exhausted, and the amount now asked for will leave about 5,500*l.* for ordinary extensions, after meeting the cost of those works already sanctioned and sums paid in excess of the previous borrowing powers.

THE business conducted by the electric supply committee of the Birmingham Corporation is making progress. There has of late been a very large demand from private consumers for electricity for power purposes, and in order to meet the demand the electric supply committee have decided to extend the supply mains. They resolved to ask the City Council for permission to obtain a special loan for the purpose. The cost of the extension has not yet been definitely ascertained, but high-pressure mains will be provided.

THE Mersey Docks and Harbour Board have adopted a recommendation of the works committee to improve the lighting of the dock estate at Liverpool and Birkenhead at an estimated cost of 6,812*l.*

VARIETIES.

THE Eccles refuse destructors burnt 11,578 tons of waste during 1906. Sales of clinker realised 405*l.* and of slag 3*l.* 11*s.*, and utilisation of the heat from the furnaces saved over 630*l.* in coal.

THE present acreage of Glasgow is 12,796, with a population of 801,000. Under the scheme for the proposed extension of boundaries it is proposed to add 15,542 acres, with 60,000 of a population, bringing the total to 28,338 acres and the population 861,000.

THE Staffordshire education committee on Saturday approved preliminary plans providing for four laboratories, viz. chemical, physics, mining and pottery, together with a large meeting-room, classrooms, offices, &c. The cost of an institute was estimated at 12,500*l.*

THE Cheshire County Council have decided to build a secondary school at Crewe, to cost about 18,000*l.* A site has been secured in Ruskin Road, and plans have been approved. The school will accommodate between 350 and 400 students, drawn from the town and district.

THE Smethwick Town Council have decided to adopt new by-laws providing that the height of rooms intended to be used for human habitation should be not less than 9 feet from the floor to the ceiling, and to forward them to the Local Government Board for approval.

THE engineering standards committee has issued its further reports. One deals with the British standard specification for carbon filament glow lamps, and the other with reference to British standard screw threads and pipe threads. They are published at the offices of the committee, 28 Victoria Street, Westminster.

WE have received a copy of the "City Diary" from its publishers, Messrs. W. N. & L. Collingridge, of the City Press offices. This handy annual, produced in the City of London, contains, for instance, a complete list with addresses of the members of the Corporation, a list of every public body connected with the City, and much further information of value for the business man.

THE Morecambe Town Council on Monday rejected a scheme for the construction of a marine lake on the

ore to cost 15,365*l*. In sections it would cost :—From
rd Street to Green Street, 5,288*l*; from Green Street to
e old jetty, 11,664*l*; or from Green Street to the Winter
rdens, 10,856*l*. It was proposed that the section costing
88*l* be adopted. The fishermen are hostile to the scheme.

THE East Ham education committee recently wrote to
e National Telephone Co. asking for a rental of 1*l*. 1*s*. per
num in respect of each of the wires crossing the play-
pounds of the schools in the borough. In reply the com-
ny state they are only prepared to pay 1*s*. per annum in
h case, and in consequence the education committee have
quested that the wires be removed at once.

THE Waltham Cross (Essex) Urban Council ordered
ir sanitary inspector to make a house-to-house inspection
the district, as a result of Mr. Rider Haggard's evidence
t summer before a select committee of the House of
mmons on the Housing of the Working Classes Bill.
e inspector's report was before the Council at their last
eting, and orders were given that a large number of
airs should be carried out to properties in the district.

THE Withington committee of the Manchester City
ncil, who were opposed in their policy of paving
suburban roads with stone setts by the property
iers in Chorlton-cum-Hardy, have decided, in accord-
e with the sanction of the Local Government Board, to
y out the work in Nicholas Road, Chorlton, with stone
s. The owners offered to do the work in tar macadam
defray the cost, but the committee rejected the offer.

THE Leeds Corporation Bill was before Mr. Jeune, one
the Examiners of Standing Order Proofs at the House of
mmons, on Monday. Under the Bill the Corporation
ers powers to construct additional waterworks in the
th and West Riding, and to abandon the Colsterdale
ervoirs and certain other works authorised under the
ct Act. The Bill also seeks powers to construct sewage
ks. The cost is estimated at 1,892,456*l*. The Bill was
red to proceed.

THE Maryport Harbour Commissioners have completed
negotiations for raising the required capital for the
ag over of the harbour estate and constructing a new
water dock with railway accommodation, in accordance
the Parliamentary powers. A preliminary contract

has been let to S. W. Harrison & Co., Birmingham, and
work will be started in a couple of months. The capital
required by the new company verges on a million. Under
the Bill they have to discharge mortgage bonds amounting
to 300,000*l*., and to produce evidence that not less than
300,000*l*. has been subscribed and two-thirds paid up

THE operations in connection with the extension of
Kirkcaldy Harbour are making steady progress, and in the
course of a few weeks the first section of the work—the
extension of the East Pier—will be completed. This ex-
tension carries the pier 600 feet further out than the original
pier. The other sections of the work—including South
Pier, dock and tidal basin—are to be commenced without
delay. The engineers' estimate the total cost of the scheme,
allowing 9,500*l*. for contingencies, at 109,500*l*., or 5,000*l*.
higher than the scheme sanctioned in September.

THE commercial attaché to H.M. Embassy at Madrid
reports the formation of an iron syndicate, the Central
Siderurgica, comprising twelve companies. It commenced
operations on January 1, and is to last for a period of five
years, prorogable from year to year. The consumption of
commercial iron, girders and plates will be divided pro-
portionately, and orders will be distributed from the central
office. Those companies who cease producing will be
reimbursed with a sum proportionate to the percentage of
the production due to them. Prices are fixed by the
directors, and from the first of the new year the price of
commercial iron was raised 30 pesetas, that of industrial
iron 40 pesetas and that of plates 30 pesetas.

THE Chester Town Council find that the new sewage
works at Sealand, which they have constructed according to
